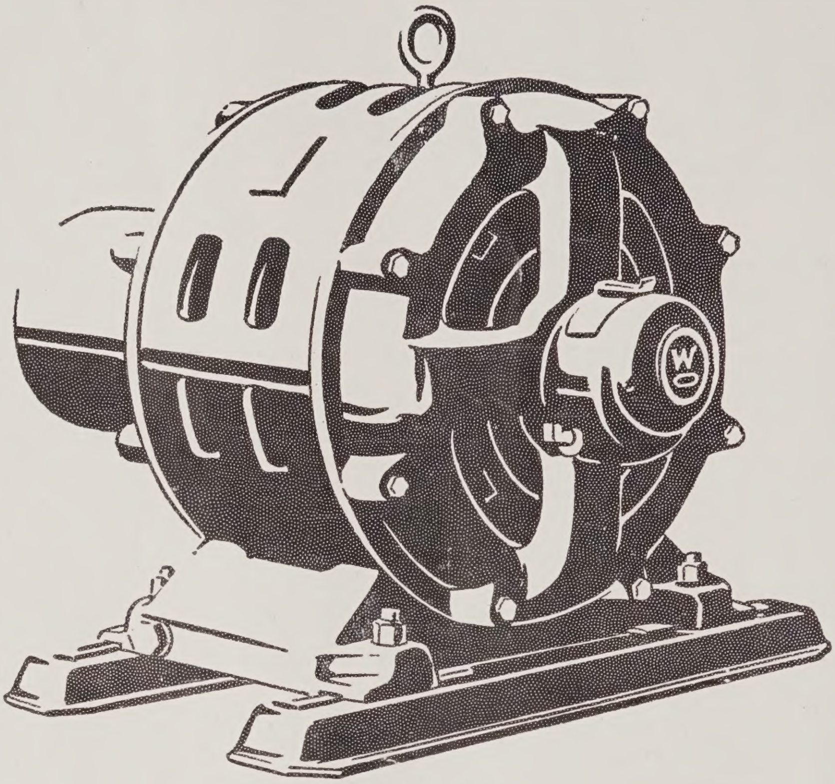
Surface Plant and Hoisting Engine

Lethbridge Colliery, Canadian Coal & Coke Co., Lethbridge, Alta., Canada

R



25 h. p. C S Motor.

Why the New Westinghouse C S is the Best Motor Ever Produced for Mine, Shop and Tipple Service

FORGED STEEL CONSTRUCTION—Frame and feet are of heavy forged open-hearth steel, thus providing great mechanical strength.

LARGE SHAFT—The shaft is unusually large in diameter. It is made of axle steel, which is 25 per cent. stronger than the machinery steel generally used for motor shafts.

RUGGED ROTOR—There is nothing about the rotor that can burn out, work loose, or deteriorate under the heat developed in service.

DUSTPROOF BEARINGS—Ample in size; interchangeable.

NO VENTILATING DUCTS—Low operating temperatures are obtained without ventilating ducts. No danger of burn-outs because of clogged passages.

LARGE AIRGAPS—Larger than those of any other motors on the market. No airgap adjusting devices needed or used.

HIGH EFFICIENCY AND POWER FACTOR—Higher than that of any other line of motors on the market.

EASILY REPAIRED—The bearings are the only wearing parts and their natural life is several years. When worn out it is cheaper to renew them than rebabbitt them, although this can be easily done if desired. Renewals of all other parts can be easily made in case of accidental damage.

COMPLETE LINE—These motors are made in all commercial sizes and speeds for all commerical polyphase circuits and for all constant speed series. Send for full information.

New Year Vows

By WALT MASON

AT this glad time we make our vows, as many as the law allows. "Here's where we cut out foolish things," we say "and start a-growing wings."

So many pledges do we make, that some of them are sure to break. So many virtues we pursue, we bite off more than we can chew. And three months hence when we look back on broken vows along our track, we feel ashamed, and sadly say, "That sort of pledging doesn't pay."

We're only mortals, after all, our limits close, our orbits small, and we should keep that fact in view, when vows are ripe and years are new. A few sane pledges we can keep, without much strain or loss of sleep, are better far for any man than is the old time wholesale plan.

You fellows, who get out the coal, should make a pledge and keep it whole.

"I'm living on this hustling globe," you say, "where each man tears his robe, to keep up with the other lads, who chase the dollars of our dads. That delegate is sure to lose who doesn't watch his p's and q's; eternal vigilance I need, if I don't wish to go to seed, for in a world where all men strive, the winner, sure, must look alive. My own experience is fine, but it's along a narrow line, and I should know what others do, what policies the rest pursue. I ought to learn from their mistakes, and profit from their dizzy breaks. With others I must get in touch; the yarns they tell will help me much. I'll take the journal of my trade, and through its helpful columns wade, and it will surely put me wise to many things that will surprise. Dodgast me if I ever hedge, on this, my latest New Year pledge!"

This is a vow the mining man who'd follow up a modern plan, and make his methods up to date, will frame at once, and keep it straight. It keeps his finger on the pulse of progress and increased results, and helps him nearer to the goal of cheaper, more and cleaner coal. Just try it out this coming year, and see some worries disappear!

COAL AGE

Are *You* Thoroughly Posted on Explosives?

If several demonstrators of rival powder companies get busy at a mine simultaneously, every one connected with that mine will be talking gas pressure and velocity and shattering effects and ammonium nitrate and organic nitrate, etc., and, what's more, they will enjoy the discussion.

> *There are many mine foremen and mine superintendents who have a very hazy understanding of explosives. To all such we would like to suggest that they cultivate the acquaintance of a few powder salesmen and demonstrators and if any of them request the privilege of a test for their explosive, by all means become enthusiastic at once.*

We know of several instances where powder demonstrators have made possible a cleaner grade of coal with a lower powder cost to the miner. Because it happens that as a rule miners have to pay the explosives bill, many superintendents take only small interest in that part of the game.

When permissible explosives were first exploited, these same mine officials adopted the new powders and are still using them; however, if you question these men you'll find that they don't even know that many changes have been made in explosives since then, and that each new brand put on the market meets a need that some mine manager, superintendent or engineer has suggested.

If left to themselves, miners always purchase the most powerful explosive that they can obtain. It ought to be evident, therefore, that if a superintendent forbids his miners the use of dynamite and rules simply that they must use a permissible explosive, he is still leaving too much to their discretion.

He may pat himself on the back and say that he has accomplished something from a safety standpoint, but he has not fulfilled his obligations to his employer who has a right to expect the best product that the mine can produce.

And the superintendent is not the only one who can learn from the powder demonstrator. To make the best showing the demonstrator has to determine the most advantageous positions for his holes and also the most economical number required; he does this by drawing on his experiences at other mines where conditions were similar, and also by discussing the matter with the miners who seem to be getting the best results. By the time he finishes his labors, he is quite likely to have hit on a system that will be adopted as standard by all of the men employed in that particular mine.

If several demonstrators for rival companies are working simultaneously, the interest becomes so keen that the post office is liable to be kept busy handling requests for powder information addressed to the Bureau of Mines. It is also at this time that the Bureau's published circulars on explosives are resurrected and passed around very much as the small boy circulates his favorite dime thriller.

Water Sealing the Wet Jed Shafts

By R. G. Johnson*

SYNOPSIS—By a proper method of lining a wet shaft with reinforced concrete and then forcing grout under pressure into the space between the lining and the rock, the influx of water was reduced from approximately 600 gal. per min. to about a pint.

The Jed shafts, near Welch, W. Va., have been completely water-sealed. These shafts were known as being among the wettest in any of the bituminous-coal fields, but by means of a heavily reinforced-concrete lining with a special backing designed to resist the force of cement grout placed under pressure, they were successfully sealed; the flow in the shafts being cut down from something in the neighborhood of 600 gal. of water per min. to possibly a pint.

The methods used and the results obtained in face of the extreme rock and water conditions were new and so full of possibilities for the future that a number of prominent mining engineers made special trips to Jed to see the work, and because of its nature it is believed a description of the procedure followed will be of interest.

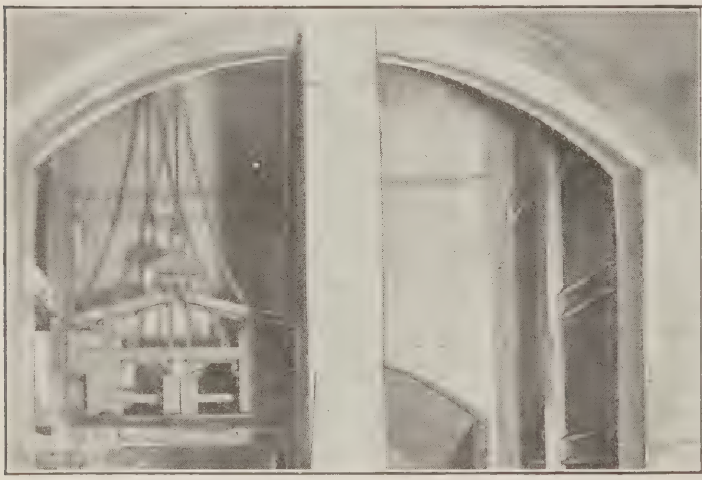

Fig. 1. Foot of Hoist Shaft, Showing Arch and Dry Concrete Lining

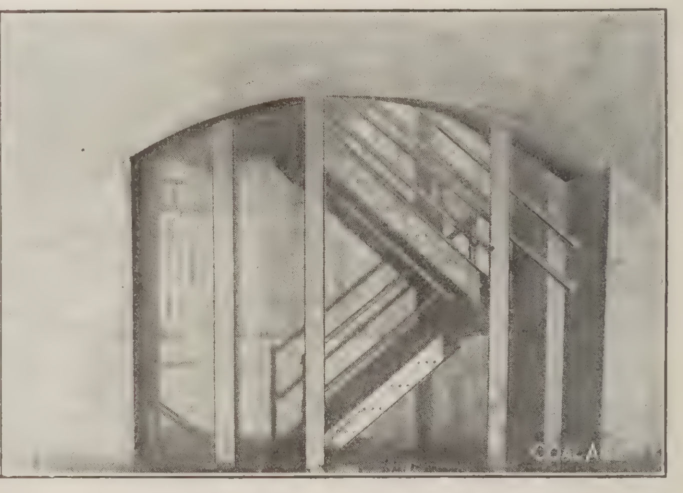

Fig. 2. Bottom of Air Shaft, Showing Foot of Steel Stairway

The mine was formerly the property of the Jed Coal & Coke Co., and is situated about two and a half miles south of Welch, W. Va., on Tug River. In June, 1913, the property was bought from the receivers of the above named company by the New River & Pocahontas Consolidated Coal Co., the West Virginia corporation of the Berwind interests. Shortly before the purchase, however, the question of handling the water in the shafts was discussed by the management of the coal company H. M. Bertolet, who is at the head of the operations of the coal company, knowing the success of rock grouting in some of the recent mine shafts, called in the Dravo Contracting Co., of Pittsburgh, to investigate the water and rock conditions in the shafts, with a view to sealing the shafts, if practicable.

With G. S. Borden, chief engineer of the coal company, the writer took cross-sections in the rock at 5-ft. intervals up the hoist shaft, noting rock structure and plotting water flows. A plan was prepared showing the clear inside dimensions of the shaft arranged to take care of the new mine cars which the coal company proposed to use after its remodeling of the mine workings. The position of the new plan was projected on the old shaft layout, and a heavily reinforced concrete lining backed with corrugated sheet iron and canvas was designed, so as to form drainage channels leading to flanged grout pipes, which extended to the inner face of the concrete lining, to lead the water through the lining into the shaft.

Before giving the details of the design, it is absolutely necessary to know something of the history of the conditions which were encountered in the actual sinking of the shafts.

Sinking Original Shafts

The shaft sinking was started in the hoist and air shafts in October, 1905, and almost immediately water in large quantities was encountered in both. The volume of water constantly increased as the sinking progressed. For the first 120 ft., which was in white sandstone, the rock was much broken, so that the water instead of coming from the ribs of the shafts continued to come from the bottom, making it impossible to construct rings for the handling of the water. These conditions of rock and water were found in both shafts. However, from the fact that the deeper shaft soon drained the shallower, it was evident that the two were connected through the crevices.

In the hoist shaft, at a depth of 120 ft., the largest feeder was struck. This was in the shape of a sheet of water about 2 ft. wide and 2 in. thick, and practically represented the accumulation of what the shaft had been making down to this point. It was also evident that an impervious stratum had been encountered in the sinking, for with progress below that point in the hoist shaft the water continued to come from the rib.

When this shaft was 140 ft. deep, or 20 ft. below the largest feeder, it was decided to discontinue sinking and install a pumping plant which would take care of the water until the air shaft was completed, it being found that the impervious stratum drained to the hoist shaft. This was done, the air shaft known as No. 2 was sunk to the bottom, a large sump was excavated, a heading driven in the coal to a point directly underneath No. 1 shaft, and the permanent pumping plant installed at the bottom of No. 2. A bore hole was then driven from the bottom of No. 1 to the heading, draining the water to the main pumps.

---

*Engineer, the Dravo Contracting Co., Pittsburgh, Penn.

But on Dec. 8, 1906, just as the sinking of the hoist shaft was about to be started again, the failure of the valves on a 1500-gal. direct-acting pump which the coal company had installed in the permanent pump room, and the failure of the company to have repair parts on the ground, caused the flooding of both shafts. The pump was at that time running constantly up to its capacity, and an additional 1000-gal. Jeanesville and a No. 12 Cameron pump were being installed in the pump room.

Pumping from the contractor's sinking plant was commenced in the flooded air shaft with two No. 10 Cameron's. These being unable to handle the water, three Emerson pumps, two 4-in. and one 5-in., were expressed in and placed in the hoist shaft. They were unsatisfactory, due chiefly to the high lift and to the wet steam, so another No. 12 Cameron pump was put in and the Emerson pumps removed. It was found necessary, however, to add more pumps before dependable progress could be made, and the final water-handling outfit required to lower the water so that the big Jeanesville in the pump chamber in the mine could be recovered consisted of two No. 12 Cameron's, three No. 10's and a Wineman pump, about the size of a No. 10 Cameron.

The lost Jeanesville was finally reached on the 24th day of January and on the 30th the water was lowered so that new valves could be put in. The sump was promptly drained and the additional Jeanesville, as well as the No. 12 Cameron, were at once put in running order, the plug shot out of the bore hole in the hoist shaft, and sinking resumed. Throughout a 60-ft. section or from a point 15 ft. above to 45 ft. below the largest feeder of water the shaft was timbered with sets and lagging, and a ring placed at a depth of 175 ft. from the top. In the balance of the shafts, buntons to support the guides were hitched into the ribs. This later, however, proved a very unsatisfactory construction. The entire operation of pumping the drowned shafts took six weeks, from 1500 to 2500 gal. of water per min. being handled continuously; there was also the constant changing and lowering of the pumps. The hoist shaft was bottomed on June 4, 1907.

THE DESIGN OF A LINING

From this brief history, the extreme conditions which had to be taken into consideration in the design of a lining are probably clear. It was deemed advisable to plan not only for the hydrostatic head equal to the depth of the new shaft to the ring below the first impervious stratum, which was practically 170 ft., but to reinforce for the pressure of the grout which would be necessary to drive back the water which itself would be under the pressure due to this head when prevented by the lining from entering the shafts. In the actual grouting this was not found to have been absolutely necessary, although the extra cost of reinforcement was good insurance.

Below the ring the lining was designed to withstand only the pressure which it was figured would accumulate and possibly bank up, as it were, between two or three other impervious strata. It was necessary, therefore, to design and construct the lining heaviest at the ring in the hoist shaft and to reduce the amount of reinforcement gradually, as the lining was constructed up from this point. Below the ring, local conditions as they were uncovered in the actual operation of lining were to govern the placing of the reinforcement.

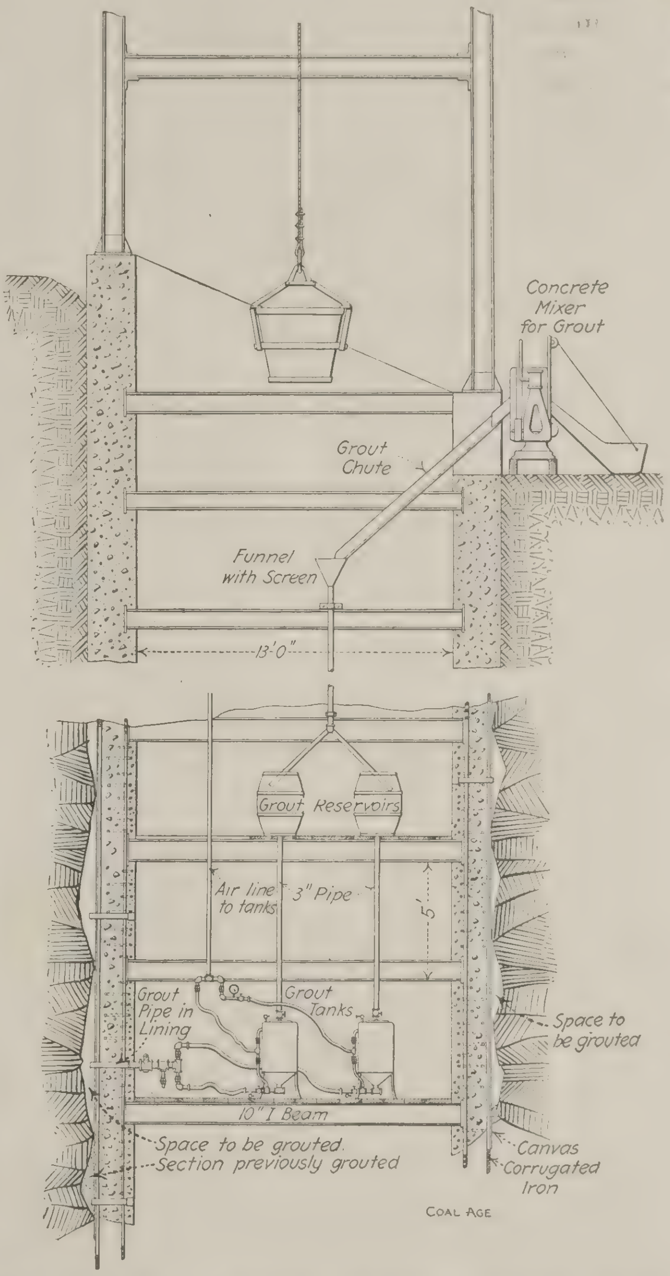

FIG. 3. VERTICAL SECTION OF SHAFT, SHOWING GROUTING APPARATUS

The design of a reinforced lining for a shaft is fortunately governed by natural conditions which determine the placing of the steel. Although the shaft sinker attempts to drill and load the shot holes so as to have the rock break to a certain line, the rib is usually so shattered that it presents a very irregular surface. In lining, therefore, the concrete will be of different thicknesses at different points.

Since the lining between buntons takes the form of a panel system, much like a paneled floor in a reinforced-concrete building, it follows that the greater the thickness of lining, the less reinforcement per foot is required. It was necessary, therefore, in designing a lining to provide for certain quantities of reinforcing steel for certain thicknesses of concrete at different depths in the shaft down to the 170-ft. point, to which it was figured the hydrostatic head would act. The accompanying drawings show the method of reinforcement and the manner in which the stresses in the panels were carried to the buntons which acted as columns.

It may be noted that a different system of reinforcement was considered before the final design was decided on. This contemplated drilling holes in the rock rib and inserting wedge bolts with loops on the outside end. These bolts were to be placed 2 ft. apart, vertically and horizontally, around the rock walls of the shaft. It was then planned to pass reinforcement through the loop holes at the end of these wedge bolts.

The concrete lining in this way would be fastened to the rock ribs and the pressure of the grout would find, of course, much shorter beams to act against. Buntons could have been made much smaller and considerably less reinforcement used, for the span of the panels would have been much smaller. But the scheme presented certain disadvantages which it was decided heavily overweighed the cheapness of the construction.

As above noted, the rock rib was so broken in structure that it was felt that an absolute certainty of the strength of the construction could not be depended upon. Again, the corrugated iron and canvas backing to the lining was deemed an essential feature and, as later proved, was a very necessary one. This could not have been placed around the wedge bolts to completely shed the water with any certainty. Again it was felt that directly underneath the bolts there might be possibly a small channel which would lead the water from the rock rib to the line of reinforcement which would be about 2 in. from the inner or shaft face of the concrete. In this case, it would have been impossible to prevent the lining from leaking. The cheaper scheme was, therefore, discarded on account of its uncertainty.

The biggest feature of the lining as finally constructed was the iron and canvas backing. The canvas was placed, as noted in Fig. 4, so that the grout would be forced into the weave of the cloth and so form an impervious mat behind the actual concrete. The sheet iron formed a stiff drainage channel to conduct the water from the rock behind the lining.

After the minimum thickness of concrete lining had been decided, the necessary enlargements of the shafts were determined, costs estimated, and contracts for the work were closed with the Dravo Contracting Co., of Pittsburgh.

ACTUAL CONSTRUCTION

The hoist shaft was turned over to the contractors about the first of August, 1913. The shaft bottom was found to be in such shape, however, that concrete arching for a distance of 20 ft. on each side of the hoist shaft was deemed advisable, and the work of the excavation therefor and the cleaning out, widening of entries and the taking down of roof necessary for this arching were commenced. Due to certain other bottom work which the coal company wanted the contractors to do, the actual lining of the shafts was not started until Oct. 18.

The routine of the work of lining was as follows: Guides and hitch buntons were removed for a distance of, say 15 or 20 ft. The shaft section was then enlarged, the drilling being done with Sullivan DB-19 hammer drills and Ingersoll jackhamers. After the rib was shot and trimmed, the muck was removed from the scaffold and a set of concrete forms placed. These forms were made in sections to cover five vertical feet of shaft. They were dapped at bunton points to permit the placing of the steel H-beam buntons.

After the forms were braced to line and level, the corrugated iron and canvas backing was hung, directing the course of the water from the rib at the section of concrete to be placed to the drainage channels behind the section of lining last poured, which water would then flow out through grout pipes which connected the drainage channels to the concrete forms. The reinforcement was then put in place, according to the plans applying to the depth and according to the thickness of the lining at that point. After cleaning the top surface of the section of concrete previously placed, removing the keys in the old concrete and covering the surface with cement grout, the pouring of the concrete was started.

After the section was poured, scaffolding in the center was piled to the sides and the men went to the lowest section of forms which had been left in place and dismantled and brought it to the surface, where it was repaired and coated with an oily preparation to prevent the concrete sticking when it was next to be used. The cycle of work to prepare for the concreting of the next form was then resumed.

The work was interrupted at several times by certain operations of the coal company, which were necessary to its interests. These various interruptions caused a total delay of probably a month and a half in the completion of the hoist shaft. It required on an average two days to perform all the operations incident to the placing of a 5-ft. section of lining. Toward the top of the shaft, 25 vertical ft. of concrete were placed per week, while from the ring up through the wettest section, a 5-ft. form of concrete often required three days. The construction of temporary water rings and the placing of a box at the main feeder which acted as a funnel and connected to a pipe in the shaft leading to a motor-driven centrifugal pump at the bottom required especial care and considerable time.

The concrete was thoroughly spaded to remove all air bubbles and their consequent voids. The importance of well worked concrete was so impressed on the shift bosses, and the actual placing of the material so watched by the superintendent personally that at no joint in either shaft did the concrete leak, even in the wettest sections. To the actual thoroughness with which the men did their work is attributed the biggest measure of the success of the proposition.

The water was of such fine quality for drinking purposes that it was suggested that it might be possible to save some of it by running a 6-in. pipe in the concrete lining vertically from the box at the large feeder to the top of the shaft, it being the intention to place a deep-well pump therein. The pipe was placed but, as it developed later, the grouting forced the water supply so far from the bottom of the pipe that none entered it, and the scheme had to be abandoned. After the lining was completed and the guides placed in the hoist shaft, the grout pipes that were making water were piped to the sump, the pipe being laid close to the concrete lining so that the cages could be operated.

Since the rock was so broken that the crevices in the strata connected the two shafts, it was decided to line the air shaft completely before attempting to grout the hoist shaft. The work here required no unusual methods or schemes that were not employed in the hoist shaft.

Grouting Operations

On the completion of the air shaft, preparations were made for the grouting of the hoist shaft. This latter with its grout pipes connected and leading to the sump had been in use by the coal company for four months for reconstruction work in the mine. A small motor-driven fan had been rigged up in one of the entries at the bottom and provided air for a limited operation of the mine while the contractors were working in the air shaft.

The lining was figured to stand the pressure for a 100-ft. hydrostatic head, that is, the plug cocks on the grout pipes for the 100-ft. section of lining could be completely shut while the grouting operation was proceeding at the bottom. However, to make assurance doubly sure the lining was grouted in much shorter sections.

The grout tanks which were arranged in connection with the mixer as shown in Fig. 3 were placed at the hole to be grouted. They were connected in a battery of two and were filled from barrels placed on a scaffolding just above, which barrels in turn were filled by pipe from the grout mixer at the top of the shaft. This was a new departure in shaft grouting and the arrangement was responsible for a speed of at least three times that attained by the old method. Speed was one of the most important requirements, since the coal company had only a limited supply of fuel for the boilers and had this been exhausted it would have been necessary to ship in coal from other mines or to interrupt the work of grouting in order to mine it. The arrangement of pipes, tanks and grout machines, worked admirably in every case.

The first operation in the grouting was to put a pressure gage on the hole to be treated. This would indicate the approximate pressure required to force grout into the hole. The tanks were then connected to the hole and grout forced in under the figured pressure, especial care being taken to see that this did not run over the limiting pressure for which the lining was designed.

Grout mixed to the consistency of a thick cream was forced into the hole until it commenced to run out of the hole directly above the one being treated. However, if the hole showing the grout was only 5 or 10 ft. above the one being grouted, the plug cock on the upper hole would be closed and the process continued until grout appeared in the hole next higher in the shaft. Grouting would then be discontinued, the machines raised to a higher level and connected to the hole last showing the grout. The operation was then continued in this manner until the entire shaft had been treated.

It was necessary on several occasions to come back to old holes and to regrout leaks around the pipes, doubtless caused by shrinkage in the cement. Such leaks required double the pressure that the initial grouting took, but the lining was amply strong to stand loads of this kind, for the force of the regrouting was, of course, expended over only a small area behind the lining. In the case of the original grouting, the pressure would be exerted over a large area, since the drainage channels always made a big void between the lining and the rock. The grouting in the hoist shaft required practically 1350 bbl. of cement and was completed in about 12 days.

On Sept. 14 the grouting in the air shaft was started. No unusual difficulties were encountered in this shaft, although a higher pressure was required. It was the intention of Mr. Bertolet to save a portion of the water from the air shaft for town purposes. Accordingly, the shaft was grouted up to the point of greatest water influx and the grout tanks moved to a much higher position in the shaft. The strata, however, were so broken up that although the lining at the upper point had been bonded to the rock rib, the grout came down through the rock and appeared with the water which it was intended to pipe to the town supply tank. The effort to save this supply was then abandoned and the shaft completely grouted. The entire operation of grouting the air shaft required only four days, in which time 1129 bbl. of cement were forced into the rock crevices behind the lining.

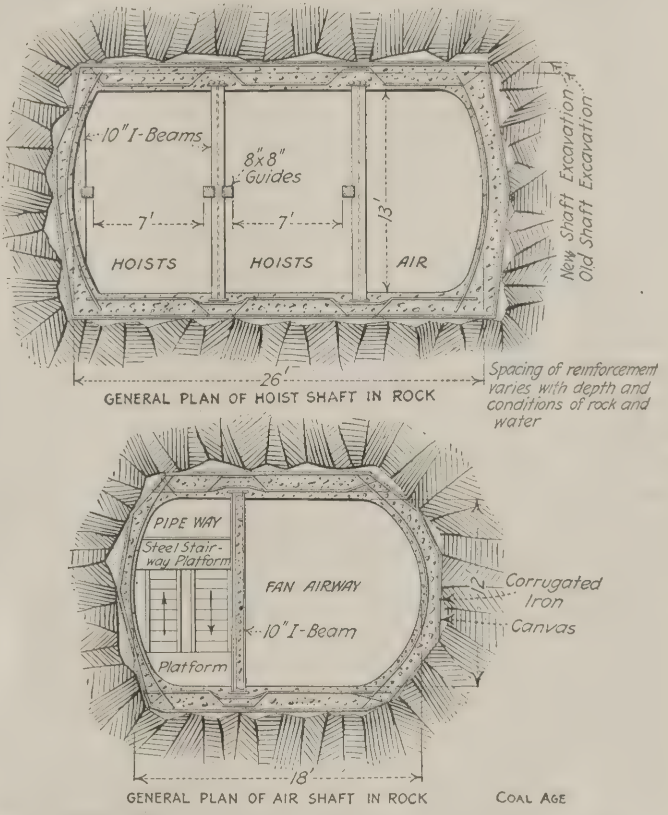

Fig. 4. Cross-Section of Air and Hoist Shafts, Showing Method of Reinforcing

A pressure of 50 lb. per sq.in. is low for ordinary grouting operations in rock, or even if applied through the linings in a circular tunnel or shaft, but when it is realized that the pressure on the back of this lining amounted to 3½ tons per sq.ft. on a flat-sided shaft, it must be readily seen that the extreme care used in placing the lining and in watching the pressure of the grout tanks was more than justified.

It was even figured that the concrete on the lower side of the reinforcement, considering a section of lining as a beam, should be allowed to crack in order that the reinforcement might take its full load. However, there were no cracks perceptible when the lining was completed. This was unquestionably due to the fact that the shaft was grouted in shorter sections than was contemplated when the design was made. It was known and realized from the start that these extra precautions had to be taken. While the picked crew which was brought from shaft regions of western Pennsylvania at the very start of the job were the ones who saw the work through to completion, it was, nevertheless, apparent that the placing of reinforcement in such a place and under such conditions could not conform accurately to the positions noted on the drawings.

Some mining engineers are dubious regarding the question of grouting in shafts, believing that the water which is so shut off will come eventually into the mine. Local rock conditions must, of course, govern this. If there are impervious strata 50 ft. or more above the coal, the chances are that water grouted from the shafts above this point will not enter the mine. In this section, or near Welch, W. Va., there is a fairly solid stratum above the coal, but the upper rocks are much more broken in structure than in other sections of West Virginia. There have been high falls of roof in the Jed mine, now called by the present owners "Havaco Mine"; yet the water which was grouted off from the shafts has not come through into the workings.

The Pumping Now Required

Two 500-gal. centrifugal pumps were required to handle the combined shaft and mine water just before the grouting started. Now, one 500-gal. pump, running only a part of the time, readily ejects the entire flow which, of course, now comes only from the mine itself.

The wisdom of such an expensive piece of construction for the sole purpose of shutting off 600 gal. of water per min. might possibly be questioned, but pumping costs and the saving of the delays and incidental inconveniences due to handling coal in a wet shaft bottom are the best answers to such arguments. The saving in actual horsepower formerly required for pumping will alone pay 10 per cent. on the cost of the actual lining and grouting. Of course, there are other distinct advantages in having an absolutely dry shaft other than the saving of actual boiler horsepower in pumping. The forming of ice on the guides in the winter time under original conditions was a constant source of danger, delay and expense, and unquestionably the amount lost because of such delays would pay the interest on the cost of the incidental construction which the coal company added to the shafts. These took the form of an extra-heavy steel stairway, a concrete partition wall in the air shaft, and concrete arching at the shaft bottom.

The scheme above described was designed by and its execution carried out under the supervision of the writer, with Maurice H. Rupert as superintendent in active charge of the work on the ground.

⁂

If a current of electricity flows through any conductor, a certain definite portion of the electrical energy supplied will be required to overcome resistance and transmit the current between any two points along the path. This energy of transmission, as it is called, is never lost, but is converted into heat. Heat will be developed whenever any electric current flows through any conductor or part thereof, the amount being directly proportional to the resistance of the conductor and to the square of the current.

Repairing Pipe Leaks

I have found the following repairs successful, says James E. Nobel, in *Power*. A 4-in. cast-iron pipe broke apart under a building foundation. To enable us to turn the water on again as soon as possible, I used the clamp *A*, 6 in. wide and ¼ in. thick (Figs. 1 and 2), with sheet-rubber packing wrapped around the pipe, and two pieces of sheet copper *D* and D_1 6 in. wide, where the edges of the clamp came together. This job was done seven years ago and is still giving satisfaction.

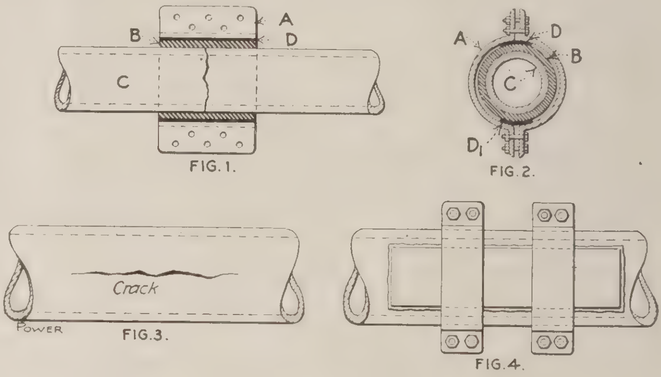

FIG. 1. FIG. 2. FIG. 3. FIG. 4.

Methods of Clamping Broken Pipes

Another 6-in. cast-iron water pipe had a 15-in. crack, Fig. 3. A piece of ¼-in. iron 4 in. wide formed to the shape of the pipe, with sheet rubber placed under it, was clamped over the break, Fig. 4. This has also proved successful.

A 3-in. steam pipe leaked at the flanges, because the threaded ends were badly corroded. A copper sleeve and a 5-in. pipe 8 in. long were slipped over the opening after the flanges were removed, Fig. 5. The space between the outside of the 3-in. pipe and the inside of the 5-in. pipe was then filled with Smooth-On, iron and elastic cement mixed. Heat from a blow torch was then applied for half an hour, and in two hours steam was turned on.

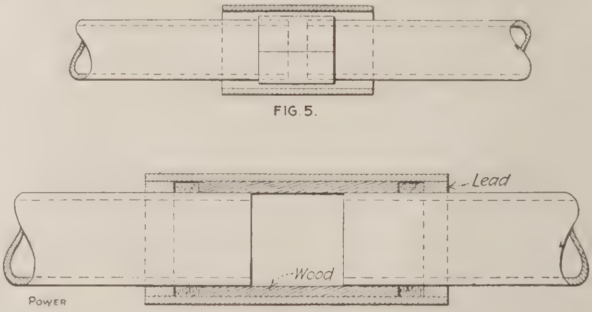

FIG. 5. FIG. 6.

Joining Pipe Ends with Sleeves

In extending a cast-iron water main it was found that what should have been the connecting length was a foot short and there was no more pipe of the same size on hand. Instead of sending to the city for a pipe and sleeve, one of the men went into the workshop and in a few minutes turned out a wooden sleeve 16 in. long to fit over the pipe. Next a 20-in. piece of larger pipe was cut and placed over the pipe ends and the wooden sleeve, Fig. 6. The joint was then run with lead in the usual way.

A Successful Automatic Gate

By H. M. Kanarr*

SYNOPSIS—A device is driven by the hoisting engine, which opens the shaft gate at the ground landing when the cage is stopped there. It also prevents over-winding, shutting off steam and applying the brakes when a predetermined point in the headframe is passed.

An automatic gate, designed to protect the ground landing of a hoisting shaft, which has been invented and patented by I. J. Harvey, a division superintendent for the Rochester & Pittsburgh Coal & Iron Co., is being tried out at the Sykes shaft of the Jefferson & Clearfield Coal & Iron Co., at Sykesville, Penn. Thus far the device has proven entirely satisfactory.

This particular device is operated by compressed air, although it might be steam driven were the air not available. The controlling mechanism, which is mounted on a small frame adjacent to the hoisting engine, is driven from the main drum shaft through a sprocket wheel and chain. The speed of the engine and the depth of the shaft determine the relative gear ratios of the two sprocket wheels.

The engine, in hoisting, rotates a rod about 1¼ in. in diameter and 3 ft. long, on which is cut a special screw thread with a pitch of about one-half inch, the rod thus making two revolutions per inch of travel of the screw thread. This screw operates a slide which is mounted on a small rod just below and parallel to it.

At one point in its travel, this slide comes in contact with and depresses a lever for opening the valve which admits the compressed air into a cylinder standing vertically against the front wall of the engine house. This cylinder is approximately 8 ft. long, and is made from a 6-in. pipe. A piston or plunger operates within it, which is connected with the gate at the shaft by means of a wire rope passing over suitable sheaves. The gate slides up and down on two 2-in. pipe guides, the vertical travel of the piston in the engine house being just sufficient to raise the gate the distance required for car clearance.

When the cage does not stop at the lower landing, the slide passes over the operating lever so quickly that only a small amount of air is admitted to the cylinder, an amount insufficient to cause any piston movement. When a stop at this landing is made, however, the lever is held open by the slide, and the air in the cylinder holds the gate suspended until the cage is moved, when the slide releases the lever to its normal position, which, in turn, releases the piston and the gate descends. A short helical spring on the piston rod cushions whatever shock may be caused by this action.

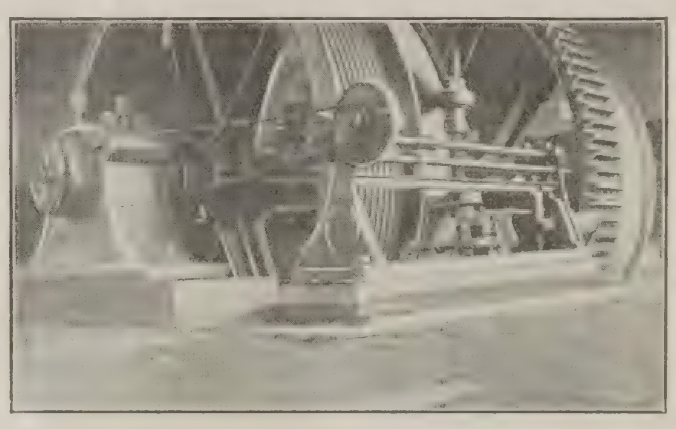
Over-Winding Is Prevented

In addition to operating the gate as above described, this device is arranged so as to prevent the cage passing a predetermined point. It thus forestalls over-winding. A small lever adjustable with a threaded nut is placed at the end of the frame on which the operating slide travels, and when the cage passes a predetermined position in the head frame, the slide comes in contact with a small lever tripping it, and thus putting the entire air pressure against a piston attached to the throttle, closing it immediately and through another piston applying the brakes to the hoisting drums. In order to move the engine again, it is necessary to shut off this emergency pressure, which may be done by suitable valves, after which the safety trigger may be again set and the engine operated as usual.

It has been found by actual test that it is impossible for the hoisting engineer to hold the throttle open against the air pressure, or to open it until the pressure has been released, while the braking effect is sufficient to stop the engine almost instantly.

The Gate Requires No Attention

The gate is entirely automatic in its operation, requiring no attention from the engineer other than to see that the mechanism is in working order and the proper adjustments made. All of the driving mechanism is in a warm room and is not affected therefore by freezing temperatures. The only part exposed is the gate, and its operation on the slides may be assured during cold weather by admitting a small amount of steam to the 2-in. pipe guides, thus keeping them absolutely free from snow and ice. The engineer can always see at a glance the position of the gate by noting the location of the piston at the front of the building.



Mechanism Controlling the Gate

The accompanying photograph shows all of the operating mechanism, except the cylinder and piston, which raises and lowers the gate. It will be noticed that in this particular case the device is arranged for a single-compartment shaft. In a double-compartment shaft, two screws and slides would be required. These might be mounted on the same frame and driven by the same sprocket. Two cylinders and pistons would, however, be necessary.

Gates similar to the above have been installed at the Stanley shaft of the Rochester & Pittsburgh Coal & Iron Co., at Helvetia, Penn., and at a double-compartment shaft of the same company at Lucerne mine near Homer City, Penn.

---

*Chief engineer, Rochester & Pittsburgh Coal & Iron Co., Punxsutawney, Penn.

The Value of Anthracite Steam Coals

By Reginald Trautschold*

SYNOPSIS—A study of some economic considerations in the use of the anthracite steam coals. The actual heat values fluctuate according to delivered prices and hence vary in different sections of the country. Grate bars should also be designed with a view to further increases in the cost of coal.

With rice coal at two dollars the ton, buckwheat a dollar more, pea still another extra dollar and nut probably two dollars more than pea—each one an excellent steam fuel—the selection of the most economic anthracite to burn in any plant is a question surrounded by varying difficulties. The cheap smaller coals are harder to burn economically, lower in heating value and contain considerably more ash and refuse than do the more expensive grades. There are disadvantages or drawbacks on one side of the equation and dollars on the other. The steadily increasing cost of anthracite coals is also continually upsetting the balance of the equation, so that the economical coal of yesterday may not be the cheapest today. To complicate the problem still further, the economic balance is not the same in all localities.

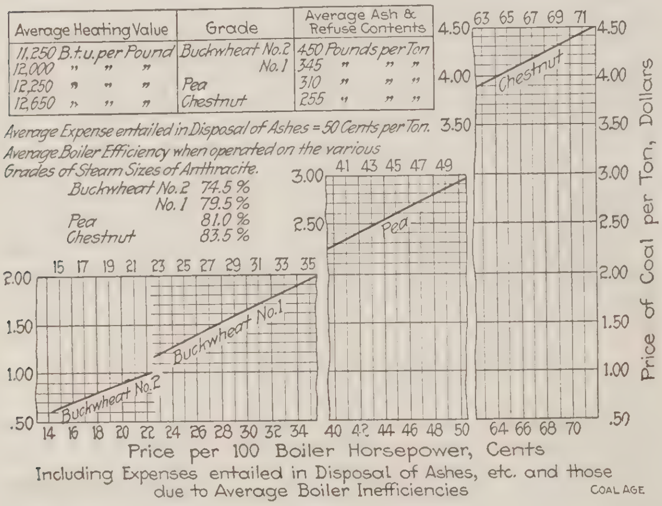


Chart I, Showing Costs per 100 Boiler Horsepower

Irregularities in Values

At the mines, the relative value of the various sizes of anthracite has not varied as much as at points requiring long rail hauls, etc. However, culm and barley have acquired a certain value since the not very remote days when they were practically worthless, or worse, while the larger coals have increased in cost fairly proportionally, the price being regulated by cost of production and by the demand. Within range of wagon or automobile delivery from the mines, the economic value of the anthracites varies inversely with the size. That is, the smaller the coal, the greater the heating value obtained for a given outlay.

The relative economy does not, however, necessarily vary with the price of the coal nor its heating value, at least it does not vary directly. While the heating value increases with the size of coal—considering only the washery sizes and the smaller prepared sizes—it must also be remembered that the ash content and other refuse decrease in proportion as these coals advance in size. These dilutants not only necessitate an expenditure for their removal, but have a tendency to reduce the boiler efficiency of the plant. The greater the proportion of ash, the more that has to be expended for its disposal and also the lower the thermal efficiency of the boiler, even though the different sizes of coal burned do contain the same heating value. The ash and refuse contents of any fuel tend always to reduce the transfer of heat to the boiler. The effect of these noncombustibles is not so marked, on account of their relatively small proportion, as the benefits derived from increased heating value, but they must nevertheless be considered if economic efficiency is to be realized in the choice of fuel.

The Steam Sizes and the Basis of Comparison

Any grade of anthracite, even culm, can be burned so that it has a certain heating value, more or less constant for standard sizes of coal, and correspondingly an economic value, which latter is governed by its heating value, ash and refuse contents. Culm and barley do not lend themselves to efficient use, however, without briquetting or pulverizing, operations which add materially to the cost of the fuel. Though anthracite briquettes do prove economical when the proper binder is employed and the combustion of coal dust has been successfully and profitably undertaken, neither of these two methods of utilizing low grades of anthracite comes under the scope of this discussion.

Rice, or buckwheat No. 2, can be successfully and economically burned on grates especially designed for such fuel, buckwheat No. 1 is rapidly becoming a standard size for power purposes, pea is, of course, the recognized standard steam coal among the anthracites and chestnut is an excellent, though costly, steam fuel. These four standard grades of hard coal may then be considered as embracing all the anthracite steam fuels and their relative economic value for power purposes will be taken up, both at the mines and at a market comparatively distant from the source of supply.

A convenient base for comparing the value of coals as steam producers is the quantity required to develop the necessary heat for 100 boiler hp. with a boiler efficiency of 100 per cent. A boiler horsepower is equivalent to 33,317 B.t.u. per hr., the heat required to convert 34.5 lb. of water into steam from and at 212° F., or practically equivalent to an evaporation of 30 lb. of water from 100° F. into steam at 70 lb. gage pressure. If all grades of coal could be burned with equal efficiency—that is, if the boiler efficiency were the same for all grades of fuel—

---

*Consulting and contracting engineer, 160 Waverly Place, New York City.

the economic value of the various grades would vary according to their heating value. But there is frequently considerable difference.

For instance, the average heating value of buckwheat No. 1 is about 6⅔ per cent. greater than No. 2, while the ash and refuse contents of the former average something like 21 per cent. less. Therefore, the average efficiency of a boiler with grates designed for the use of buckwheat No. 1 would be nearly 7 per cent. greater than a similar boiler fired on rice, the same care and efficiency being employed in burning the two grades of fuel and the respective grates equally well proportioned. At the mines or in localities where coal can be purchased at similar rates, this variation in boiler efficiency and the additional expense entailed in disposing of the greater quantity of ashes and refuse from the poorer grade of coal mean that though buckwheat No. 1 costs nearly 100 per cent. more than rice, its net cost per 100 boiler hp. averages but about 75 per cent. more. Other grades of steam sizes of anthracite are affected in a similar way.

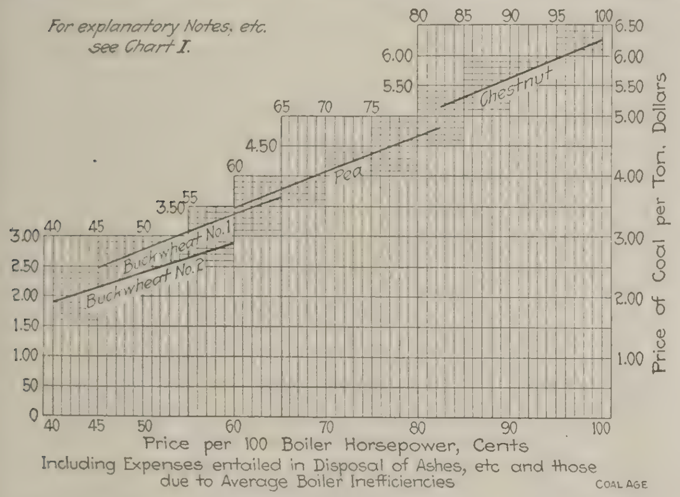

Chart II, Showing Costs per 100 Boiler Horsepower at New York

Value per Boiler Horsepower on Mine Prices

Based on mine prices, Chart I graphically depicts the net cost of the various grades of anthracite per 100 boiler hp. with coal commanding different prices per ton, due allowance being made for expenses entailed by the presence of ash and other refuse and the losses due to thermal inefficiencies of the average boiler when fired on the various grades of coal. The chart shows that there is a fairly uniform relation existing between the prices of coal at the mines and its cost per power-generating unit, and that the better the coal, the less economical it is for steam-producing purposes, its cost per ton increasing about 50 per cent. more rapidly than its steam-generating power; the chart also indicates the limiting prices that can be economically paid for various grades.

As as example, should rice command a price of $1 per ton and if at the same time buckwheat could be purchased for $1.15 per ton, the higher-grade coal would be the more economical, although containing but 6⅔ per cent. more heat units per pound. Such conditions could not arise at the present rate at which coal is sold, but such rates are not impossible if the progress in efficient burning of rice continues as rapidly as it has during the past few years. The price of buckwheat is regulated almost entirely by demand and not the cost of preparation, which is little or no more than rice costs. If the numerous power houses now fired on buckwheat should modify their grates so as to burn rice instead, a step that at present would effect considerable saving, the price of the poorer grade of coal would go up rapidly and the decreased demand for buckwheat would result in its becoming cheaper so that their respective costs per ton might fall to a difference of 15 per cent. instead of nearly 100 per cent. as at present.

At a distance from the mines the relative value of the small sizes of anthracite may differ considerably from the mine prices; freight and delivery charges have to be added and these are not governed by the heating value of the coals but are based upon weight. Freight rates do vary according to the grade of coal, it is true, being less for the poorer qualities; but delivery charges do not, so that the average price of coal delivered at the power house at a distance from the source of supply bears little relation, so far as the true economic value of the coal is concerned, to the prices current at the mines. Take the New York market, for instance—the average price of buckwheat, delivered, is about 40 per cent. greater than rice, while the average difference at the mines is nearly 2½ times as great. This naturally has considerable effect upon the relative value of the various grades, often reducing the difference to a considerable extent.

Variations According to Freight Burdens

Regarding the freight and delivery costs as fixed charges, just as if the price at the mines had been increased by an equivalent amount, a chart may be plotted to embrace the range of prices through which the various grades of coal may pass and the cost of the coals per 100 boiler hp. for any locality where the market prices fall within its range can be shown. Such a graphic illustration is given in Chart II, covering the range of prices that may be expected in New York; similar charts are equally applicable to any other locality where prices are the same. In such sections of the country the gap between the minimum possible price for pea and the maximum for rice is well overlapped by the average prices of buckwheat and not simply connected by the minimum and maximum prices as at the mines.

Three grades of coal are thus brought within a possible equal value for steam purposes—rice at about $2.87, buckwheat at $3.35 and pea at approximately $3.48 per ton, all being equally economical. At the present time (October, 1914) pea commands more than this figure and rice is obtainable at a better price. Buckwheat has already, or may before long, be counted upon to touch this figure, $3.35 per ton delivered, and the time cannot be far distant when many plants, now operating with pea, will find it to their decided advantage to burn buckwheat and others that now burn buckwheat to fall back on rice. With buckwheat at $3 per ton, it would be economical to remodel a plant so as to operate on rice, provided the latter costs less than $2.65 per ton; and similarly with pea at $3.75 per ton it would pay to use buckwheat at $3.60 per ton.

The foregoing comparisons apply only to localities where the average prices are about the same as in New York. Where anthracite is more expensive, the range of economical coals is greater and the gain derived from abandoning the use of a certain grade for one of poorer quality is not so marked. The nearer the source of supply the greater the economy of using a low-grade product.

The charts presented herewith are based on coals of average heating value, reasonable ash and refuse contents, burned under boilers of ordinary efficiency, and the fuel costs per 100 boiler hp. represents values that can be counted upon with efficient operation. They may be bettered, of course, but if they are not fully realized, the coal used is below specifications or else the boiler efficiency is not what it ought to be. Should better efficiencies or higher heating values than those on which the charts are based be obtained, very close fuel costs per 100 boiler hp. may be arrived at by interpolation of the chart readings, such calculated values being accurate enough for all practical purposes.

Effects of a Slight General Increase in the Cost of Coal

Two general rules may be laid down as to the economic value of anthracite for steam generation in the power house: First, the lower the price of anthracite, the poorer the grade of coal (smaller size) that can be advantageously used, and *vice versa*. Second, in selecting grates for new plants or in the remodeling of old ones, it may be advisable to install grates for the grade of coal poorer than the most economical grade at the time of installation, if the economic values of the two coals do not vary greatly. This allows for an increase in the price of all grades of anthracite, which must be expected, and an increase has less effect on the fuel cost per boiler horsepower when cheap coals are employed than with a more expensive, though more efficient, grade.

In a locality where buckwheat commands a price of $2.80 per ton at the time of installation of grates, and rice a price of $2.40, it would be good policy to install grates for burning rice, although for the time being buckwheat would prove the more economical coal. A 10 per cent. increase in the price of the two grades, which would not be at all improbable, would reverse their relative economies. With rice and buckwheat commanding $2.80 and $2.40 per ton, the fuel costs per 100 boiler hp. would be 49.6c. and 50.1c., respectively; but with buckwheat at $3.08 and rice at $2.64, the fuel costs would be 55.2 and 54.9c. per 100 boiler horsepower, respectively, and should there be still further increases, the balance would favor rice even more.

In sections of the country where the difference in cost of buckwheat and rice is still 40c. per ton, and the price of buckwheat $3 per ton, it requires only about a 2½ per cent. increase in the prices of the coals to throw the economic balance in favor of rice.

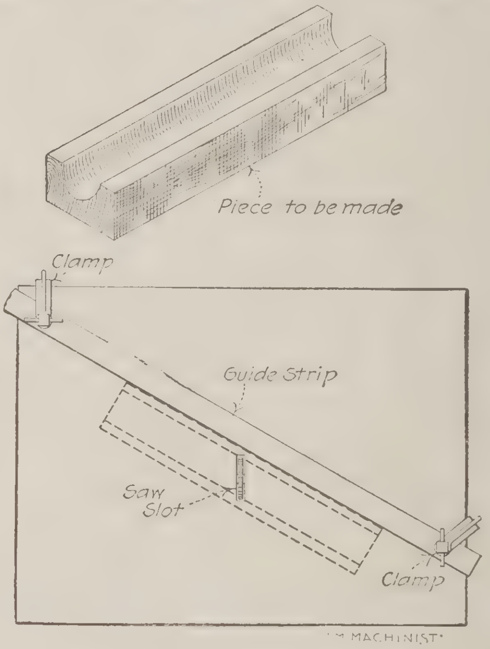
Kentucky Makes Large Gain in Mine Output

The principal mineral product of Kentucky is coal, the value of which constitutes about three-fourths of the value of the state's total mineral output. In 1913, according to the U. S. Geological Survey, the total value of the mineral production of Kentucky was about $27,000,000, of which the coal mines contributed $20,516,749. This is an increase of about $4,500,000 in value of total mineral products over the figures for 1912.

The second industry in importance, clay-working, contributed $2,914,276 in 1913, an increase of $470,536 over 1912. The quarrying industry is third in importance in the state, its products in 1913 being valued at $1,150,205, against $1,282,148 in 1912.

Sawing Elliptical Troughs

A short time ago, says Johnson Barre in *American Machinist* for Nov. 5, our wood-working department made use of the following "stunt" which, while it may be old, was certainly new to me, and may bear passing on. A number of wooden pieces had to be made about 3 ft. long by 8 in. wide and 5 in. thick, troughed out about as shown in the illustration. The curvature of the trough had to approximate fairly closely a given diameter. This curve was laid out in pencil on one end of each piece, previously dressed to the required outside dimensions. The rough stock was then removed, leaving enough to finish smoothly. A flat strip of wood, having a straight edge, was clamped across the table of a circular saw, as shown, and a test piece run along this strip for a short distance to obtain the angle necessary to set the strip so that the saw might cut to the correct curve. This angle was readily obtained after a few trials, and the troughs were then easily and rapidly finished. This method is applicable only where the curve is part of an ellipse with the long axis vertical.



Sawing Elliptical Troughs

Where such is the case, it is rapid and accurate, as the saw can be raised after the correct angle is determined, to cut right up to the desired curve, and the trough furthermore is uniform in curvature from one end to the other.

Automatic Mine Doors in Alabama

The Republic Iron & Steel Co. is installing automatic mine doors in its Warner and Sayreton mines, in Alabama. These self-acting doors do away with trappers, and thus reduce general operating expenses. The doors are manufactured by the American Mine Door Co., of Canton, Ohio. which concern charges coal companies a rental price of $6 per month for mule doors and $7 for mechanical-haulage doors.

A New Entry-Driving Machine

By A. H. Gibson*

SYNOPSIS—This machine is virtually a powerful air-driven coal puncher with an elevator and conveyor for loading cars attached. It has been in use for about six years, undergoing development meanwhile, and is now for the first time being put on the market.

One feature of coal mining which is admittedly dangerous and undesirable is the use of explosives. The only reason for their employment and the risk entailed when they find their way into ignorant or careless hands, is economy. If, however, their use could be entirely eliminated without decrease of output or increase of cost, and without introducing other and perhaps more grave dangers, the safety of coal production would be considerably enhanced, while the occupation of coal mining would become more attractive to the coming generation.

At the present time this improvement in means and methods is applicable to the driving of entries. It is alleged that the Ingersoll-Rand "Heading Machine," "Entry Cutter" or "Cutter and Loader," as it is variously called, accomplishes this result. The machine in question is not new, having been in existence for some six years and having cut many miles of entry. It has now, however, arrived at the status where its endurance, performance and possibilities are known quantities which can be thoroughly proven on a commercial scale.

The principle and operation of this machine may be clearly understood from reference to the accompanying drawings, Figs. 1 to 4. Fig. 1 represents the device ready for undercutting. The machine itself consists of a powerful compressed-air coal puncher mounted upon a carriage and under the control of the operator. A lever elevates or depresses the puncher pick. Another lever moves it from rib to rib by means of a small air engine, while a third lever moves the whole puncher together with its truck bodily toward or away from the face, the conveyor remaining stationary within certain limits or accompanying the forward or backward motion of the puncher as desired.

The puncher itself makes about 160 strokes per minute, and is controlled in the same manner as the ordinary hand-operated machine going from rib to rib and making a cut extending the entire width of the entry.

The conveyor is driven by a separate engine suitably controlled by a stop valve, and the mine car is filled evenly by moving the same about three times during the loading process by means of the brake on the car, provided the latter is on a sufficient grade, that is, on the dip the car is stopped at the proper place to fill the end nearest the machine first, after which the brake is released, allowing the car to move down hill until the loading is complete.

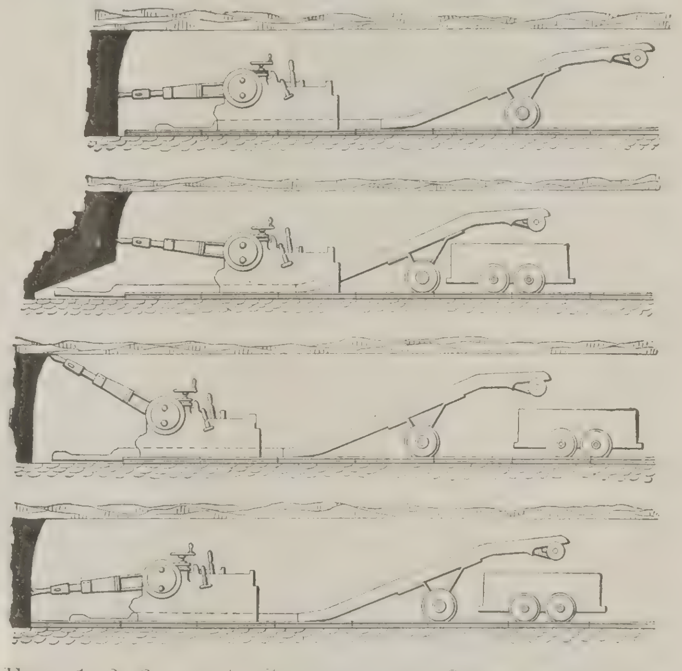
Fig. 2 shows the machine and entry after the undercut is finished, and the conveyor moved into the kerf. This illustration also shows an unfilled car in place and in readiness for the process of knocking down the coal, the car being shown as it would be placed when working on the rise. Making the undercut is the longest part of the operation, requiring from 25 to 40 min., according to the hardness of the coal.

Fig. 3 shows the knocking-down process completed. This ordinarily takes place faster than cars can be supplied. The next operation is to pull the conveyor back about 7 ft., lay a section of track, and move the conveyor forward to position.

Fig. 4 is the same as Fig. 1, except that the entry has advanced about 5 ft. and five to six cars of coal have been loaded out.

The Average Advance Is 10 Ft.

Two set-ups during the shift constitute a 10-ft. advance of the entry. It is estimated that under suitable operating conditions, such as high coal of the quality found in the Pittsburgh seam, that the machine should average 250-ft. advance per month of 25 working days, working day shift only, night shift being reserved for the laying of tracks, piping, etc. Under actual working conditions, the advance made and the repairs show such a speed to be perfectly possible.



Figs. 1, 2, 3 and 4. Showing the Operation of the Machine

Two of these machines which have been in operation at the Annabelle Mine, of the Four States Coal & Coke Co., at Worthington, W. Va., have been in operation since June 1, 1913. These have been operated two shifts of nine hours each per day, and entries cut averaging 10½ to 11 ft. wide and 6½ to 7 ft. high. Where conditions have been suitable and cars have been served to the machine without delay, as much as 20-ft. advance has been made in a single shift. This condition does not, however, hold true all the time, as the machines are considerably delayed by lack of cars, but the average operation over a period of two or three months showed a progress of somewhat over 10 ft. per shift on the average.

The question naturally arises, how does this machine compare with present costs of entry driving? According to conditions, comparisons will vary somewhat, but taking into consideration the first cost of the machines, which work in pairs, the total actual daily expense figures out favorably to the machine, everything being considered. This estimate, however, does not take into account the increased rate of entry driving, the reduced risk of gas or dust explosion, due to the absence of explosives, the fact that a straighter entry is secured, that the roof is better since there is no blasting to shake it loose, also that the ventilation is better due to the straight sides and roof facilitating the movement of the air current.

---

*Engineer, Phillipsburg, N. J.

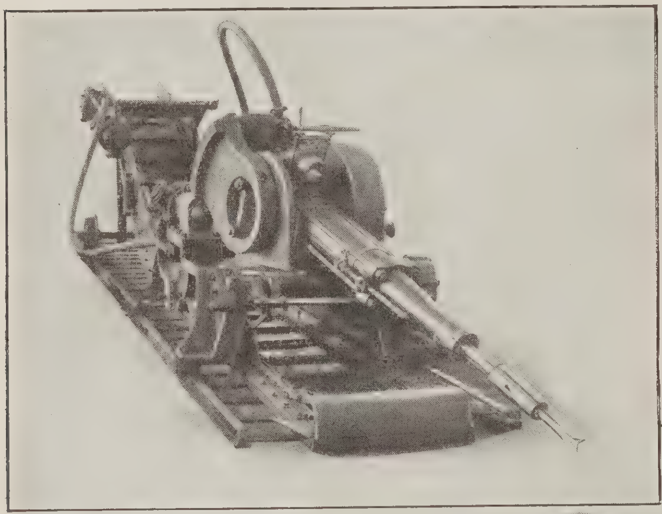


Fig. 5. Front View of Heading Machine

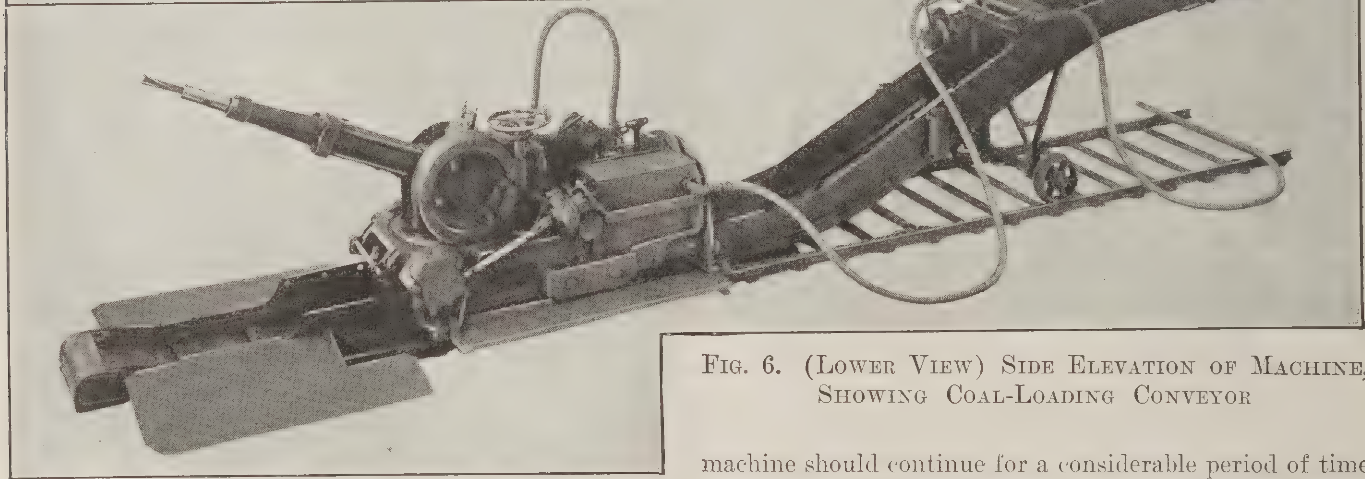

Fig. 6. (Lower View) Side Elevation of Machine, Showing Coal-Loading Conveyor

A reduced risk of explosion is secured by the absence of electric arcs or sparks, and the much ridiculed but nevertheless real menace of live wires strung along the entry, which are, even under the best circumstances, a more or less imminent peril to both men and animals. The advantage of this machine is still more apparent where the roof is bad and requires timbering.

With this, as with other pneumatic mining machines, where gas collects in the entry over night, a small quantity of air may be allowed to escape from the pipings nightly, with the result that in the morning there is no gas and the air at the face is clean and fresh.

The Spacing of Breakthroughs May Be Greater

Owing to the ventilating effect of the exhaust air from this machine and the fact that this exhaust takes place while work is being done, the distance between breakthroughs prescribed by law could be doubled without serious danger. This fact reduces this expensive deadwork about half, and allows the entries to proceed more rapidly.

The use of this machine renders possible the working of coal mines by the retreating system, which, should it become general, would effect a considerable saving of human life due to the reduction of accidents from falls of roof. Its use also secures greater uniformity and reliability in daily output than is at present common.

This machine has the disadvantage that when working on the rise a water supply is necessary, which has to be piped to the machine in the same manner as the air line twice each week. The water jet and a beam of light from a safety electric headlight follow the movements of the coal pick, both spray nozzle and headlight being mounted upon the plunger frame and moving with it. Where the entry is on the dip, the coal is usually wet and requires no water spraying.

As has been stated above, this machine has been in operation for about six years. It is, however, only now being placed upon the market. In the operation of the earlier machines, failures and breakages were frequent, and it was found expedient to redesign practically everything on the whole device, after which it was necessary, considering the previous experience, that the redesigned machine should continue for a considerable period of time in operation, to prove beyond doubt that it would stand up to continuous work cutting and loading coal. The success or failure of any mechanical coal cutter depends largely, if not entirely, upon its reliability of operation.

The present machine with its embodied improvements and simple working parts has gone through a severe development, resulting in a steel-inclosed, grease-packed construction, the wear upon which is bound to be extremely small. In the course of driving the several miles of entry in the various mines which this machine has cut, nothing has stopped its advance. Horsebacks have been cut through, large lumps of sulphur have been removed, the entry has been driven under treacherous roof, curves have been cut, and headings as wide as 13 ft. have been made. The machine has also been used in cutting breakthroughs, slate has been cut down and loaded. No accidents have occurred, although the work has been done in gaseous mines with gas issuing from the face most of the time. It is believed, therefore, that compared with the usual method of entry driving, namely undercutting and shooting down, the employment of this machine renders the work at once faster and safer.

U. S. Mines Bureau Trains West Virginia Miners

Mine-Rescue Car No. 8 is now traveling through the Pocahontas (W. Va.) field, along the lines of the Norfolk & Western Ry., engaged in a training tour which will embrace all the mining centers of this great coal field. Ten-day stops have already been made at Elkhorn, Eckman, Vivian, Welch and Gary, and over 100 men have received complete training in mine rescue and first-aid-to-the-injured since Nov. 10, when the training trip commenced.

General Manager Edward O'Toole, of the United States Coal & Coke Co., at Gary, is coöperating in every way with the Bureau's representatives in their present safety-first campaign at this camp, and over 50 men have received a complete course of training at Gary, where a fine mine-rescue station is already established with an up-to-date mine-rescue and first-aid equipment, in charge of Chief Chemist Vitus Klier.

Car No. 8 is now in charge of Mining Engineer D. J. Parker, from Alabama, who has just relieved Engineer H. D. Mason, Jr., who has been called to Pittsburgh as assistant to J. W. Paul, chief of the mine-rescue division.

The present intention is to extend this West Virginia training tour until July 1, taking in all the important coal fields of the state. Chief Mine Inspector Earl Henry is furthering the work of the car, as are his district inspectors, Messrs. Blenkinsopp and Lambert.

The complete itinerary for Car No. 8 along the Norfolk & Western Ry. field is as follows:

ITINERARY OF CAR NO. 8 THROUGH WEST VIRGINIA

Town	County	Dates of Training
Gary, W. Va.	McDowell	Dec. 20 to Jan. 3, 1915
Davy, W. Va.	McDowell	Jan. 4 to 10
Marytown, W. Va.	McDowell	Jan. 11 to 19
Premier, W. Va.	McDowell	Jan. 20 to 29

"Buck Up"

Written Expressly for COAL AGE

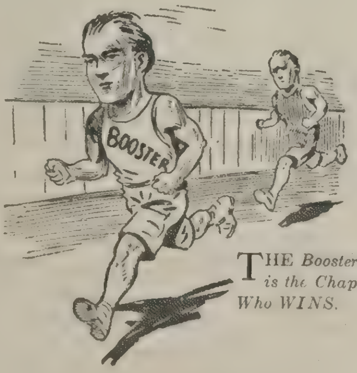
By BERTON BRALEY

THIS is an old familiar phrase,
Yet one that people will forget,
Although they hear it all their days,
"—The Grumbler never got there yet!"
To groan and sigh and moan and fret
Will cure no business ills or sins,
You've got to keep your nerve, you bet,
The Booster is the chap who wins.

IF mining troubles dog your ways,
– If markets are the worst you've met,
It does no good a howl to raise
The Grumbler never got there yet!
There's no use pining with regret,
That's not the way success begins,
In spite of dullness, worry, debt,
The Booster is the chap who wins.

WHEN foolish tears bedim your gaze
Until your handkerchief is wet,
You'll fail to see the chance that pays—
The Grumbler never got there yet!
However troubles may beset,
The wise man faces them—and grins,
And conquers fate by toil and sweat,
The Booster is the chap who wins.

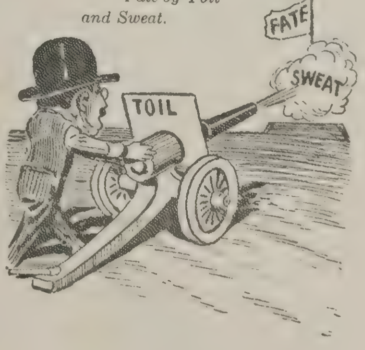
* * *



THE *Booster is the Chap Who* WINS.

HERE IS THE MORAL, *boiled down, net;*
The Grumbler never got there yet!
And while this earthly globule spins,
The Booster is the chap who wins!

HE *Conquers Fate by Toil and Sweat.*



The New Home of Coal Age

The accompanying pictures show the new Hill Building, at the corner of 36th Street and 10th Avenue, New York City, which is the new home of Coal Age and its four sister engineering journals. This building has been erected by the Hill Publishing Co., owning these publications, and was especially designed for their purposes. The ground area is 100x175 ft. There are 12 stories, each one 14 ft. in the clear, an unusually great height. The 12th story, where are the offices, is of double height, having a gallery along two sides. About 3900 tons of steel were used in this building, the steel framing being heavier than in any other building of its height in New York City. The permissible floor load is 300 lb. per sq.ft. The side walls are largely of glass, being approximately 70 per cent. of the total wall surface; otherwise the exterior of the building is covered with white tiling. The steel columns of the framework are protected by cement poured in from the top, 31,000 bbl. of cement being used.

The ventilation of the building is artificial. In the basement there are three blowers capable of delivering 47,000 cu. ft. of air per min. each. These draw the air through three air-washing machines, which remove the dust and give the proper degree of moisture to the air before it is forced through the building. On the roof there are two exhaust fans, each with a capacity of 67,000 cu.ft. of air per min. There are a number of small auxiliary fans. In summer the air can be cooled, and in winter it is heated somewhat before being forced to the floors, but the main heating of the building is done by means of a hot-water circulating system.

The supply of drinking water for the building is drawn from the city mains through large filters. It is cooled in a refrigerating plant having a capacity equivalent to three to five tons of ice per 24 hours. The filtered and cooled water is distributed to sanitary fountains.

The New Home of Coal Age

The power plant comprises three 250-kw. direct-current generators. The coal for the steam boilers is delivered to hopper bins, whence it is taken mechanically to the automatic stokers that fire the boilers. The ashes also are removed mechanically. Mechanical conveyances are to be found throughout the building for other purposes wherever necessary. Thus, between the offices and the composing room, which is on the eleventh floor, there is a pneumatic-carrier system. From the bindery, on the 10th floor, the mail bags going to the post office are dispatched to the truck on the ground floor via a spiral chute. This chute might also serve as an auxiliary fire escape in case of emergency, although the need for it is hardly conceivable.

Probably no other building was ever so thoroughly safeguarded against fire. The building itself is chiefly of steel and cement. The furniture and fittings are of steel. The building is equipped with a sprinkling system throughout. There are two main stairways at opposite corners of the building. Each of these is isolated in an independent shaft, communication with the several floors being through doors that are closed when not actually in use. Besides these provisions there is an adequate fire-alarm system.

The lighting of the editorial rooms and general offices is done by the indirect system. The floors are covered with interlocking rubber tiling, which is both noiseless and durable. A noiseless typewriter is also used. With these aids toward the abolition of noise, the sounds in this large office, which is occupied by 225 persons, are scarcely more than those of a reading room in a public library.

The composing room and electrotyping departments are on the 11th floor. The printing and binding departments are on the 10th floor. All of these departments are equipped with the most uptodate machinery and methods, and are supposed to exemplify the last word in printing-house-construction equipment. There are seven linotype composing machines and three monotypes. The pressroom contains nine presses for the regular runs on the several papers. The regular weekly editions of Coal Age, *Engineering News, American Machinist, Power* and *The Engineering and Mining Journal* amount to 100,000 copies and the output of printed paper weighs 41 tons. The handling of this from the time the white paper is received in rolls to the time when the printed papers, wrapped, addressed and sorted into mail bags, are taken by automobile truck to the general post-office is as thoroughly mechanical as can be.

The floors of the Hill Building that are not occupied by the company are rented to concerns in similar or allied lines of work. Thus the floor immediately under the pressroom is occupied by the engraver who does the work for the Hill Publishing Co. The supply of paper is obtained from the ground floor. With its power plant in the basement and a restaurant for employees on the roof, this printing building is about as thoroughly equipped as anything of the kind can be. The design and construction throughout reflect the mature experience of John A. Hill, the president of the company.

⁂

Dr. G. Hickling, in a paper before the Manchester Literary and Philosophical Society, has shown that vegetable structures are preserved in coal in two forms: (1) In a carbonized condition, found pure in "mother of coal," quite opaque even when much less than one micron thick; (2) impregnated with the transparent material. Spores are the most readily distinguishable objects preserved in this matter, their walls being greatly swollen by impregnation.

The Labor Situation

SYNOPSIS—The federal troops are to be removed from Colorado by degrees. The eastern Ohio miners show less disposition than was anticipated to settle with the operators. They stand somewhat firmly for the Union scale. In Illinois there has been much destitution.

A conference was held by President Wilson, Governor Ammons, of Colorado, Governor-elect Carlson and Senator Shafroth on Dec. 23. After the conference, Secretary of War Garrison stated that a plan had been agreed upon for the withdrawal of troops. This was to be done slowly and the observed effect of partial evacuations would determine the rapidity with which the troops would be withdrawn.

Disturbing Pacificators to Be Kept out of Colorado

Governor Ammons advised the President not to send Seth Low, C. W. Mills and Patrick Gilday into the state just at present and declared that the investigation of the Federal Industrial Relations Committee had delayed a settlement of the strike for two weeks. He thought that the troops could be removed in 10 days after withdrawal commenced.

Col. James Lockett, in charge of the U. S. troops in the southern Colorado strike district, announced, on Dec. 23, that after Jan. 1 he would not impose any restrictions on the sale or shipment of liquor in that district.

Colorado Fuel & Iron Co.'s Beneficences

The Colorado Fuel & Iron Co. held as usual its annual Christmas entertainment, distributing candy and toys among the families of its employees. The families of those who till recently have been on strike and have now been re-engaged received presents as if no cessation of work had occurred. Unfortunately many of the families in the tent colonies cannot be given houses as there are not enough to shelter everyone.

The Colorado Fuel & Iron Co. put its new pension fund into operation Dec. 26, Frederick Darraugh, of Pueblo, Colo., receiving a pension of $125 a month which is half his present salary. He has been in the employ of the company for 33 years and is now 61 years of age. He used to be a timekeeper and has risen to the position of assistant auditor of the steel plant at Pueblo. In 33 years he has never asked for a leave of absence or taken a vacation.

No Settlement in Eastern Ohio

The proposition of the Pursglove-Maher Coal Co. to open its mines in Belmont County paying a mining rate of 58c. per ton for lump and 22c. per ton for small sizes received little attention from its men. The notices were posted the week before last and the company announced itself willing to start the mines as soon as the men accepted the proposition. Another offer of $2.84 per day for cutters and loaders was also made. Some assert, however, that the men in eastern Ohio are getting more and more discontented over the methods employed by the organization officials in handling the strike and a large majority would go to work if permitted to do so.

The action of the operators in offering the split scale as mentioned above or a payment of 44.61c. per ton on the mine-run basis, which is the Pittsburg scale, shows conclusively that they do not want to make war on the miners' union or on any one. They are sincere in saying that they cannot pay 47c. per ton for machine-mined run-of-mine coal under present conditions and that they will not open their mines on that basis. The operators engaged in eastern Ohio adhere as strongly to their position as at any time in the past and they have no intention of surrendering to their men.

Eviction of Striking Mine Workers

The Pursglove-Maher Coal Co. sent the following telegram to the officers of the United Mine Workers of America on Monday, Dec. 28.

> The Pursglove-Maher Coal Co. expects rent for ten months for all its houses occupied by former employees and members of your organization or possession of its property from your men by Jan. 15, 1915. See by the papers that your funds are in such shape that you can take care of the miners indefinitely. Answer quick as upon your reply will depend our action with the civil authorities. We must have definite answer by Thursday noon. Will be at Hotel Frederick, Huntington, W. Va., Tuesday and Wednesday.

The message was signed by Joseph Pursglove, president, and T. K. Maher, secretary and treasurer. No answer was received on Monday.

Notices were prepared for service at Steubenville, O., Dec. 29, demanding that 25,000 striking mine workers in Jefferson County pay the 10 months' rent they owe the coal companies under penalty of eviction. The families reside in Warren, Mount Pleasant, Smithfield and Springfield townships and constitute a large part of those involved in the wage disagreement. The United Mine Workers of America will endeavor, it is said, to contest the eviction writs in the court. It is naturally rumored that the intention is to bring strike breakers into Ohio.

More Strike Benefits and Free Clothing

In the meantime the United Mine Workers of America through its executive boards which met at Indianapolis last week endorsed the strike in eastern Ohio and made arrangements for paying larger strike benefits. Where the money was to come from was not announced.

Senator Atlee Pomerene of Ohio has introduced in the national congress a bill to permit of the giving of 2000 discarded uniforms of the Ohio National Guard to the striking miners. When Governor Cox discussed that matter with the war department some time ago he was informed that army regulations prevented the giving of the uniforms to any one.

Poverty in Illinois Mining Settlements

Christmas this year has seen more poverty in the mining settlements of Illinois than in many years past. In Belleville, Ill., three hundred families, mostly of miners, were in need of assistance at Christmas time. In the mining section east and northeast of St. Louis, there was much poverty this year, and especially at Witt, Ill., where the Peabody mines have been idle for several months. Governor Dunne sent a Christmas present of $5 each to twenty of the most needy families there, and much assistance was rendered to others at Witt and in the mining towns adjoining.

Conditions were extremely bad at all the mining towns to the south of St. Louis, with the exception of Royalton, Zeigler and Christopher. Farther north in the Danville District, 340 coal miners, who have been idle for many months, received an order for $7.50 worth of groceries and other provisions for Christmas. The citizens of Harrisburg almost compelled the O'Gara Coal Co. to put some of its mines in operation, so as to give all its miners an equal opportunity to make a livelihood.

Frank Farrington Elected Head of Illinois Miners

Frank Farrington, of Streator, Ill., has been elected president of the Illinois or 12th district of the United Mine Workers of America. He received 22,134 votes while his opponent, Adolph Germer, of Mt. Olive, obtained 21,135, so Farrington has a majority of 999 votes. Steve Sullivan, of Springfield, received 14,136 votes. Thus it was a three-cornered fight but Farrington's greater popularity can be judged from the fact that he carried seven of his men into office including vice-president Frank Hefferly, of Collinsville. However, Duncan McDonald, the supporter of Adolph Germer, was reëlected secretary-treasurer by 26,856 votes, his nearest competitor out of the four, C. A. Sullivan, of Herrin, receiving 10,383 votes.

Frank Farrington is probably a more reasonable man than Adolph Germer. Duncan McDonald has always been regarded as an unreconcilable. It is true Frank Farrington ordered the strike in Vancouver Island from Seattle, Wash., Apr. 30, 1913. He does not appear to have had much more to do with it, and John P. White, the president of the main organization was probably as much to blame for that abortive struggle as Farrington. (See "Coal Age," Vol. 5 pp. 253, 280, 577 and 879.) Farrington was formerly on the National Executive Board for the State of Illinois.

Duncan McDonald will be remembered for his violent attacks on the president of the American Federation of Labor, Samuel P. Gompers. John Zimmerman, of Springfield, was elected to the National Executive Board.

*

Next Week, We Publish Our Annual Statistical Number

The Jan. 9 issue of Coal Age will be devoted entirely to a review of the coal industry in America during 1914. The chief mine inspectors of all coal-producing states will tell us of the progress made by coal companies in their territory. Trade conditions in all important consuming centers and shipping ports will be reported by our special field correspondents. There will be a chronology of events as well as articles covering the industry's progress along engineering lines.

Don't Miss This Issue—You'll Need It For Future Reference.

Power Department

The Use of Coal

SPECIAL CORRESPONDENCE

SYNOPSIS—Any commodity is valuable in exactly so far as it fulfills a need. In order to create and foster a market for his product the coal producer should study with care the requirements of his customers.

It is usually conceded that the interests of the mine operator are supposed to cease when he has "delivered the goods" and collected payment therefor. It might be well to remember, however, that coal, like any other commodity, only possesses a value in proportion to the efficiency or effectiveness with which it meets the needs of the purchaser.

For example, a cutler might offer one of his customers a bowie knife of exceptional quality and workmanship. If that customer at the time, however, was requiring a razor, the vender's advances would probably be treated with marked disrespect. Hence, in order to successfully market the product of a mine, it is not only necessary to produce a good article, but to have an idea of what use the purchaser intends to make of the goods after he has bought them.

The advantage of this is two-fold: In the first place, much preliminary talk in attempting to sell unsuitable goods is avoided. Secondly, the vender can often point out to the purchaser methods of treatment of the goods which will enormously improve their value to him, and therefore stimulate future sales.

It is to the advantage of the coal producer therefore to study the methods employed in the use of fuels in order to be able to offer to any prospective customer the proper sizes, quality and mixture of fuel for any specific purpose, and to be in a position to point out any errors in arguments advanced by a doubtful buyer or one who is dissatisfied with what he has purchased.

In order to illustrate this position, we may take one field only in which coal is extensively used, namely, the production of steam. It is hardly too bold an assertion to say that the man who wants to sell coal should know something about the furnace in which that coal is to be burned. For example, there are furnaces in which the boiler tubes or plates are considerably removed from the grate. These are more particularly adapted to long-flaming coal which requires considerable space and time for the perfect combustion of the gases and lighter volatile elements before they impinge upon the heat-absorbing surfaces of the boiler.

DIFFERENT COALS REQUIRE DIFFERENT FURNACE PROPORTIONS

On the other hand, anthracite coals, or those containing only a low percentage of volatile matter, burn with an intense local heat, and therefore the furnaces best adapted for their use have grates comparatively close to the water-carrying boiler elements.

This is but one example of the many factors which may go to make up a customer's complaint. If a vender does not know the class of boilers and quality of coal which the purchaser is trying to combine, he may become generally puzzled at the complaints received, regarding undue repairs or low steam production per pound for coal, after his fuel has been given a tryout. If, on the other hand, he does know the probable cause of the difficulty, he may be able by a timely remark to convince a customer that at comparatively small expense an alteration may save him considerable money in fuel.

In some plants it is essential for the proper burning of the coal that the latter shall reach the furnace in a comparatively unbroken condition, and must be free from any excess of dust or slack. Other plants on the contrary are fitted with mechanical stokers for the express purpose of burning fine coal. The buyer will, of course, mention his requirements, but it is much to the advantage of the seller if he possesses a clear conception of the type of plant for which his fuel is destined.

Often the condition of the coal as it arrives at its destination depends largely upon the way in which it has been handled in transit, and where there are any particular requirements as regards freedom from dust, and two modes of shipment are possible, it may be worth while considering alternate methods to ascertain whether carriage by rail or water is likely to give the best results.

COMPLAINTS AS TO WEIGHT

Then again complaints are sometimes received as regards the weight delivered. Under such circumstances it is not ordinarily necessary either to call the colliery scales into question or to describe the complainant as a perverter of the Christian virtues. The real difficulty in such a case often lies in the weather. A variation in climatic conditions at the beginning and end of a railway journey often makes considerable difference in the amount of water contained in the coal, and therefore in the weight thereof. It may be taken as practically certain that a customer of any considerable size keeps a record of gross and net weight delivered to his power plants and it is just as well therefore that the coal owner on sending out his product should not only take its weight, but should keep some sort of record on the condition in which the coal leaves the mine.

At the present time, much attention is being paid to the calorific value of coal purchased for industrial or steam-raising purposes, and it is only fair that discrimination should be made in values on this account. In many of the larger power houses and in some of the small ones as well, samples are taken periodically of the coal as received, and these samples, after being suitably crushed and prepared, are subjected to a test for heating content and ash.

These tests, if systematically carried out, should give the average figure not only for ash and clinker, which are purely waste products, but also for the water content, the volatile constituent, which determines whether or not the coal is free burning, and the fixed carbon which yields a steady and comparatively slow combustion. With data on these points, the owner of the power plant can, to a certain extent, determine the value of a coal from the point of view of steam raising.

Cheap Fuels May Be Expensive

It has been repeatedly demonstrated that many cheap fuels, which, however, carry a large ash- and clinker-forming content, and are consequently low in calorific value, are disadvantageous and more expensive than a higher-priced coal possessed of greater heating power. If consumers are analyzing coal, it is to the elementary interest of the coal operator that he should also take samples both of the run-of-mine and of the various grades produced, obtaining therefrom accurate figures upon the above qualities, upon which he may base his arguments when selling.

The proposition that it is necessary for a mine owner to know the plant that is consuming his product is capable of still further proof, when any particular customer is actually or is about to become a large buyer. It then pays the coal producer to visit the plant concerned, and with the permission of the owner, see for himself the conditions under which his fuel is to be used.

The best coal in the world cannot give its full heat value if it is not being properly fired. Although most large power makers are today fully aware of the value of carbon-dioxide recorders in connection with their flue gases, there are still some who think such apparatus to be a scientific fad. The good performance of any fuel depends first on complete combustion and second that large quantities of excess air be not admitted to the furnace, as otherwise the heated gases become mixed with this cold air, their temperature being thereby lowered and their efficiency as a heating medium destroyed.

The carbon-dioxide recorder is an excellent check on the proper burning of the fuel, since it registers at every instant the proportion of carbon dioxide (CO_2) contained in a given volume of flue gases. This with a recording draft gage and a thermometer gives an excellent idea of the way in which the plant is being operated. It is not too much to assert that a loss may often be converted into a gain through properly burning the fuel purchased.

It is the duty of the coal producer in cases of this kind to make suggestions to the power-plant manager which will safeguard the proper use of the commodity which the former is supplying. The same general argument applies to the proper testing of feed water, for poor results from a steam generator often attributed to the fuel may readily be traced to the condition of the boiler plate or tubes due to the admission of improper materials along with the feed water. Temporary and permanent hardness are the natural enemies of efficient heat utilization.

The Record of Input and Output

In some power plants, a check is kept upon the working of the installation by measuring the coal input and comparing the same with the power output. This is a particularly easy matter when the output is electrical. Now the number of pounds of coal consumed per kilowatt-hour generated (although a good test of the overall efficiency of the power plant) may sometimes be used as an adverse argument regarding the quality of the coal supplied. It is therefore advisable that the producer of the latter who is vitally interested in the proper sale and use of his commodity should knew something of the possible losses that may occur in a power house between the furnace and the wattmeter.

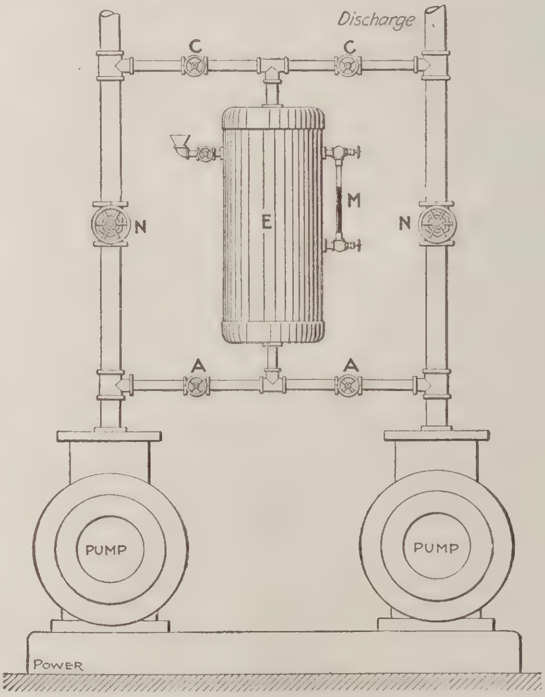
For example, much power may be wasted in leaky steam traps, in excessive condensation, in holding boilers as standbys when it would be perfectly safe to shut them down, and in running engines at uneconomical loads. Of course, a good power-plant manager is able to distinguish between losses incurred in this manner and defects in fuel supply, but it is open to question whether every power installation is conducted on highly scientific lines.

Consequently, when complaints are received concerning bad results from fuel, it might pay the owner of a mine to visit the power plant consuming his product with an eye open for bad operation, and to do this intelligently he should have at least a fairly comprehensive knowledge of the practical working of a steam power plant.

There are many other points which might be raised in support of the belief that it is not merely sufficient for a coal producer to sell fuel and then wash his hands of the results. A good salesman should be a good buyer if his position in the transaction were reversed. To be a good buyer one should know not only what he wants but what he is actually purchasing. And in the coal trade in order to be a good buyer, one must understand steam engineering.

Boiler-Compound Feeder

The illustration represents a good form of boiler-compound feeder, says R. C. McGahey in *Power,* where *E* is the body and *M* the glass gage, the merit being that the compound does not pass through the pump. The feeder can be readily regulated or cut out by valves *N*, *C* and *A* while the pumps are in operation.



Compound Feeder Connected to Two Pumps

Editorials

Success

In a week or two we will announce the date of issue of a special "Success" number of COAL AGE. There isn't anything so close to the heart of the average individual as success, and the coal industry has an abundance of great men, great machines and great systems.

We will cover it all, dealing only with what has made good, whether it be a man, a method, a motor or a mining machine. We want to tell how success was won here, there and everywhere. A mine was a failure, it is now a successful operation; how was the change wrought? That's the story we want to tell in its every phase.

Therefore, we want our readers to help us make this proposed issue of COAL AGE the most interesting and valuable number we have so far gotten out. Tell us the story of men, mines and machines that have stood the test of everyday hard knocks. If you can't prepare a story for us yourself, then make a suggestion to us concerning what you have in mind, and we'll follow the tip and get the facts ourselves.

If you have a good story of an actual case, but don't care to sign the article, remember you don't have to. Think this over right now, and the chances are you can pen a description of something or somebody, that will not only interest other coal men, but benefit them as well.

Of course! we pay for the article you prepare for us.

⁂

What Will the New Year Bring Us?

We have all made our new resolves, rolled up our sleeves and started the work of 1915. The war may last all year, or it may end very soon. However, millions of people in this country have stopped speculating on this great uncertainty and have buckled down to free themselves as far as possible from the influences of the European trouble.

The outcome of our affairs in 1915 depends largely on ourselves. If the war continues no one need expect a boom in our own land, but by eliminating all waste of money, material and time, we can enter on an era of satisfactory, independent progress.

This does not mean we should hoard our money; on the other hand, the time is here when we must show confidence in ourselves and our nation by going ahead with long delayed plans. True! we must be careful—only harm could result from pulling the throttle wide open—but caution does not imply inaction. We have all had time to get our bearings and survey the road ahead, so a steady, certain advance in all lines of industry is now in order.

COAL AGE sees a brighter outlook for 1915, and we are therefore going to back our opinion by carrying out to fulfillment numerous extensions in our work. The coal industry has hit bottom, and all worth-while signs point to an increase in general mining activity. Labor troubles will be largely eliminated from this year's calendar, and the result will be a better feeling in the industry.

Therefore, let us all throw away our blue glasses, and above all else let us be sanely optimistic. No good can come from shouting untruths concerning business prosperity. People who follow this plan deceive no one, not even themselves. Likewise we must eliminate the other extreme, which is responsible for a flood of senseless pessimism. To many people, the face of futurity leers black and disagreeable. Hope to them is forbidden fruit. Imagination is of use only to portray calamities that never happen.

Add to your New Year's Resolutions the following: I will exercise hope and preach optimism every day during the year. I will not forget that I am a part of the greatest nation on earth, and that I live in a land of untold wealth and possibilities. I will not give ear to calamity howlers either in my office, my home or on the street. I will keep a cheerful countenance even should clouds gather overhead and I will impress on all I meet that clouds of whatever hue and density never stand still—there is always a wind to blow them away. Lastly, I promise to remember that I work in an industry that produces the second necessity of life—the first is food—and nothing can stop the demand or replace the product I send to the markets of the world.

⁂

At Home and Abroad

Between the optimistic and pessimistic American, your average citizen is "eternally fussed up." The American eagle in the imagination of our national evaluators is as often bedraggled like the sparrow after a fight as he is spread or displayed like the triumphant bird of heraldry.

For our part, we confess that most of the claims for arrogance or for regret equally fail to appeal to us. As for the claims of alien supremacy, we feel we could doubtless duplicate those vaunted conditions if we would accept them when duplicated. But somehow our American way, with its disadvantages, seems very good to us and we are ill disposed to be disturbed in our pursuit of it.

Samuel Dean has been showing us some German and French mining plants and we will readily grant that there is nothing like them in America. They are truly magnificent and show the genius of their engineers. Yet we cannot avoid the suspicion that there is no directorate in America but would discharge the officials in charge of these foreign enterprises if the men in them produced as little as they do in Germany—one ton per man underground. The miners in the United States produce from three to seven times as much per man for each working day and the result is that the cost of coal is much lower.

Moreover, the miners of the United States make better wages, at least twice as much as the German miners. Why then should we be ashamed? We have greater efficiency per man, cheaper coal and better paid working men. All we lack is "stylish works" and a greater safety.

Now there are parts of America where conditions in the matter of safety are excellent, and it is by no means clear that all unsafe conditions are chargeable to excessive neglect of either employers or men. Let us not be misunderstood—we do not say that there is no neglect, for it is certain that there is, but we declare that it may not exceed the negligence manifested abroad.

The difference in the death rate in various parts of this country as a result of falls of rock and explosions of gas and dust clearly exhibits the fact that these accidents are in a class by themselves. Some operatives are much endangered by them; others are not likely to have them to face. Consequently, we will compare the other accidents underground in the United States with those in the Dortmund district of Germany, an area where about one-half as many men are putting in their time underground as can be found mining coal in the United States.

In 1911, the death rate from accidents underground other than "falls of ground" and explosions of gas and dust was 1.437 per thousand of those employed below the surface. The rate in the United States was only 1.28 for the same class of accidents in that year.

In 1912, in the United States, assuming the same ratio of employees to underground workers (1.202) as in 1911, we find that 1.11 persons were killed per thousand employed underground in the accidents selected, whereas in the Dortmund district 1.541 per thousand lost their lives in that specific manner. It will be granted readily we think that the roof-fall and explosions question is severe or unimportant according to locality and that the other accidents which we have here compared are more truly controllable, and it is in these accidents which have no necessary relation to locality that the American record is creditable.

But still those magnificent buildings fill the eye. Surely a people who can construct such magnificent mines, must be mining efficiently. Order, design and modernity are apparent on every hand, and we are prone always to connect together fine plants and efficiency. However, the two may have no connection whatever with each other. The magnificent structures may be only the outcome of munificent prices. Let us examine this carefully.

It would not be fair to compare German prices with American because it may be, at once, conceded that wages are unequal and the difficulties of mining are not on a parity. But it is permissible to compare German prices at one period with those at another and see whether the American market has advanced as liberally as the German. Since 1886 the average price of coal in Germany has risen 103 per cent. at the mines. In that same time it has fallen in the United States 4 per cent. We quote these figures on the authority of the British Board of Trade.

If we allowed our coal men to combine and to increase prices 103 per cent. when producers in other countries lowered their prices 4 per cent., the very foundations of our democracy would be shaken. It may be right to combine for fair prices, but we shall have to think twice before we consent to such a measure of syndicatism as has made such marvelous developments possible in Germany.

If we had such profits we also could build almshouses and bath houses and provide for pensioners. We also could build lamp houses like palaces and make our mine portals like triumphal arches. The American workingman, however, believes profits are criminal, the American consumer is raging horribly about coal combines and both are getting the benefit of a situation which is by no means profitable to the coal operator. And down in the hearts of the coal producers is a belief that while profits in his industry should be larger than they are, there is a limit which should be set for the good of the public, and he is sure that a 103-per cent. increase per ton in the present price would be many times that limit and should not be permitted in any democracy.

For if, instead of the $1.05, which was the average price of coal at the Pennsylvania bituminous mines in 1913, $2.13 was paid, just think how our mine roads could burgeon out with rose bushes and could be curbed with concrete. Then, indeed, we could model the superintendent's house after the home of a feudal baron—and the rest of the country could pay the bill.

But it is not our way. Such desirable conditions—and they are desirable—can only come here when the proletariat, which has been given liberal wages and cheap living, learns to put back into industry and permanent improvement what it now too largely expends in the grog shop, in frequent changes of apparel and in general waste.

⁂

Some Comments on the Panama R. R. Contract

The contract for supplying coal to the Panama R.R. has been awarded finally to Wm. C. Atwater & Co. (Vol. 6, pp. 814, 854, 892, 933, 1048). The coal is to be supplied from the Thelma and Nora mines of the Virginia Pocahontas Coal Co., at Coalwood, McDowell County, W. Va., and from the mine No. 1 of the Lake Superior Coal Co., near Huger, McDowell County, W. Va. It is generally understood that these mines are all working the upper Pocahontas beds, and if this be the case, it will be the first time that no coal from the No. 3 original Pocahontas bed has been supplied on this contract.

The bid of Atwater & Co., as originally reported, was for 350,000 tons, at $2.70, f.o.b. Hampton Roads, the proposal calling for 500,000 tons. We are informed that all of the bids were turned over to the U. S. Bureau of Mines for report on the various mines and to figure the cost of one million B.t.u., according to their standard formula, so as to reduce all bids to a common basis, combining the ash, heat value and price per ton. It is also stated that the Bureau of Mines sent their inspectors to the Atwater company's mines to obtain further data and samples before the contract was finally awarded.

There were several bidders from Pennsylvania, but they were all unsuccessful, although it is said that there was only one mill difference in the cost of a million B.t.u. as between the Atwater coal and Colver, Penn., coal.

The Government does not yet seem to appreciate the importance of the ash-fusing temperature of coals, although fuel experts are generally agreed that this and the ash percentage are the most important determinations on coals of similar nature.

⁂

Who Gets the Promotion?

COAL AGE last week, on page 1030, published a problem cartoon entitled, "Who Gets the Promotion?" We anticipated that the question would be a popular one, but we did not expect it would attract such wide attention. From the many answers received so far, it is quite certain this will be the most popular discussion we have ever printed. If you haven't already sent in your answer, do so today.

Sociological Department

Teaching English to Foreign-Speaking Men

By Peter Roberts*

SYNOPSIS—The writer has elaborated a most successful system of teaching foreigners English without the employment of their native language in the process.

There are 15,000,000 foreign-born people in the United States, which is about 15 per cent. of the population. The proportion of male to female in this group is 129 to 100, so there are 8,450,000 foreign-born males in the country and of these more than 97 per cent. are employed in gainful industries. Of the males of both native birth and native parentage 75.5 per cent. are so employed. All the men of foreign birth are not foreign-speaking.

Of the 15,000,000, about one-third have their birthplace in English-speaking countries, while half of the remainder are more or less conversant with the English language. Thus, the problem of teaching English to non-English-speaking wage-earners is not as serious as some men would have us believe. The number of persons of foreign birth in the United States today not able to make themselves understood in English is not more than 5,000,000. This is about five per cent. of the total population.

The Roberts Method of Instruction by the Practical Illustration, the Spoken Statement, and the Printed Description

Over 70 Per Cent of the Coal Miners Are Foreign-Born

The foreign-born are neither equally distributed among the states of the union nor are they found in equal numbers in the industries of the country. In agriculture, of the 10,500,000 male wage-earners only 9.1 per cent. are foreign-born; in coal mining, 750,000 men and boys are employed, and 70 per cent. of them are of alien origin. If 50 per cent. of the 525,000 foreign-born in the coal-mining industry are not conversant with the English language, it means diminished efficiency, increased accidents, want of harmony, and irritating misunderstandings between the coöperating agencies. The question then is, How can these men be taught English? I will explain the system used by us in doing this work.

Basic Principles

This is based on three fundamental principles which should be observed by all anxious to learn or teach a language:

First: The *ear* is the organ of language. Speech is sound modified to convey thought, and the organ designed to catch sound is the ear. The eye and the hand may supplement, but if any man wants a working knowledge of any language he must use the ear in attaining it.

Second: The lessons given should deal with experiences perfectly familiar to the pupils. The simplest and most interesting actions of daily life should be clothed anew in the garment of the language to be acquired. You cannot discuss coal mining with a man who never saw a coal mine in operation, nor can you teach a man a language if you attempt to give him lessons dealing with objects and actions wholly out of the realm of his experience.

---

*Secretary, Industrial Department, Young Men's Christian Association, 124 East 28th St., New York City.

NOTE—Article read before the West Virginia Coal Mining Institute, at Huntington, W. Va., Dec. 10, 1914.

Third: Each lesson should conform with fundamental principles laid down by psychologists as aids to memory, the law of association of ideas, the law of contrast, the law of sequence in time, etc. By the aid of these, the memory is greatly relieved, and the pupil can better concentrate his attention on correct pronunciation and enunciation.

These three principles are used in the Roberts System of teaching English to foreign-speaking men.

A Class in English in a Foundry at West End, Toronto, Canada, during the Noon Recess

Let us illustrate these principles. The first lesson we give a class of foreigners is about getting up in the morning. The lesson is as follows:

PREPARATORY COURSE

Getting Up in the Morning

awake	I awake from sleep
open	I open my eyes
look	I look for my watch
find	I find my watch
see	I see what time it is
is	It is 6 o'clock
must get up	I must get up
throw back	I throw back the bed clothes
get out	I get out of bed
put on	I put on my pants
put on	I put on my stockings and shoes
wash	I wash myself
comb	I comb my hair
put on	I put on my collar and necktie
put on	I put on my vest and coat
open	I open the door of my bedroom
go down	I go down stairs

These sentences observe the sequence in time in the action of getting up in the morning. Each man goes through this stage every day. The word open suggests shut; find, lost; throw, catch; put on, pull off; open, close; etc. The teacher who does his work right will teach this lesson and build around it a vocabulary following the suggestions which come to him by the laws specified.

Teaching the Lesson

How is the lesson taught? The teacher has five steps to follow in teaching each lesson:

First: Oral instruction. Nothing is put before the eye or in the hand of the pupil. He is told to listen carefully to the words pronounced by the teacher, and repeat them after him. The teacher says, "I awake from sleep," suiting the action to the words, and the class says the sentence. This is followed in order by the other sentences as the class makes progress. The teacher talks slowly and distinctly, and is never weary of repeating. After about twenty or thirty minutes the class can rehearse the whole of the lesson from memory, at the suggestion given by the teacher with an appropriate gesture illustrating each sentence.

Second: A chart on which the lesson is printed is now hung up, and the class sees the lesson in print for the first time. The teacher then leads the pupils in reading, going over the lesson three or four times, leaping from sentence to sentence, to test the capacity of the pupils to read.

Third: Sheets of paper are next given the pupils, on which the lesson is printed in both book and script type. Each scholar is provided with pencil and paper, and is told to write out the lesson, the teacher during the exercise passing from pupil to pupil to see how he does the work. Then after ten or fifteen minutes, he collects the papers, corrects them and calls the attention of the pupils to their defects.

Fourth: Review of the lesson. The teacher takes a

A Class Composed of Men of Many Nations

sheet of paper and covers the chart. He asks for the first sentence and suggests it by a gesture. The pupils say: "I awake from sleep." The teacher uncovers the sentence and says: "Good, and then what?" "I open my eyes." "Splendid, and then what?" etc. The pupils by this review get, not only the lesson, but also sentences such as "good," "right," "splendid," "that's it," "try again," etc., which in a short while they will be able to use in their conversation.

Fifth: Grammar practice. Grammar is not taught in the abstract; but grammatical forms are practiced in connection with each lesson, so that the pupils talk grammatically and are trained to do so from the beginning. This is done not only by each exercise, but also by reading and writing. The pupils who show an eagerness to learn our language, if they have a good teacher, will, in an incredibly short time, begin to converse in common, everyday English in their work and in their buying.

The Equipment

A word ought to be said about the tools used in this work. Three courses have been prepared for the men:

First: The Preparatory Course, which comprises thirty lessons; ten on domestic life, ten on work life, bearing directly upon the work in which the man is engaged, and ten on social life, helping this man so that he may go to the store or shop, postoffice or railroad station, and transact his business in the English language.

Second: The First Reader is the second course, in which lessons are given on the history of our country, on outlines of geography, dealing especially with the United States, and on the forms of our government, so as to prepare the foreigner who is anxious to become a member of our family to pass the examination prescribed by the federal government for naturalization.

Third: The Second Reader is a more advanced book, having readings in history, industries and civics for advanced pupils.

Teaching All Nationalities without Knowing the Tongue of Any

Accompanying each lesson are grammar suggestions, so that the teacher, in each session, may drill the men in certain forms which are essential to correct talking or writing.

For men employed in the coal-mining industry, we have prepared the following lessons:

INDUSTRIAL SERIES—BITUMINOUS MINE WORKERS

I. Going to Work

stands	The miner stands at the foot of the shaft
asks	The miner asks the foreman: "Give me a light"
takes	He takes his lamp and lights it
trims	He trims the wick
burns	The wick burns brightly
puts	The miner puts the lamp in his cap
walks	He walks along the entry
lights	The lamp lights the way
walks	The miner walks until he comes to his room
enters	He enters the room
looks	He looks around the room
left	All things are as he left them last night
takes	The miner takes off his coat and vest
hangs	He hangs up his coat and vest
puts	and puts away his dinner pail
goes	The miner goes to his box for oil
fills	He fills his lamp with oil
takes	He takes his tools out of the box
carries	He carries his tools to the face
lays	He lays down the tools
examines	The miner examines the face
begins	He begins the day's work

INDUSTRIAL SERIES—ANTHRACITE MINE WORKERS

VII. Firing the Shot

puts	The miner puts the powder in the hole
shoves	He shoves the powder back carefully with the drill
puts	He puts in the tamping and tamps it carefully
takes	He takes the needle, tipped with copper, so that it will not strike fire
puts	He puts the needle in the hole
completes	He completes the tamping of the hole
withdraws	He carefully withdraws the needle
examines	He carefully examines the squib
sends	He sends his laborer to warn the men in the next chamber
go	The men in the next chamber go to a place of safety
goes	The laborer goes down the road and shouts "Fire! Fire!"
shouts	The miner shouts "Fire! Fire!"
lights	The miner lights his squib with his touch paper
runs	The miner runs to the next crosscut
continues	The miner continues to shout "Fire! Fire!"
goes	The blast goes off

RESULTS

The men who will learn these lessons will acquire a knowledge of English which will help the foreman and fireboss to talk to them intelligently concerning their work and duties. It will also enable them to communicate with their fellow workmen, so that they may feel that common bond of union which should pervade all industrial units. It enables the foreman or superintendent also to talk face to face with the foreigner, and avoid misunderstandings and trouble, which otherwise might disturb relations and demoralize an industrial plant.

Thousands of men, taught in classes using this system, are today able to talk, read and write in English. A year's faithful work done by any group of men, led by a good teacher using this system, will enable them to have a talking knowledge of our language, which will be a good basis for further instruction in any line the foreigner may choose. These classes for foreign-speaking men have been laboratories where men are tested, and the born leader or the mechanical genius has been discovered and set on the path that will give the industry and society far more than he ever could give if kept at the pick and shovel. The foreigners bring with them brain, as well as brawn, and the interest of each industry is conserved by giving the foreign-speaking worker in it the opportunity to come to his own in the industrial life of America.

⁂

Jermyn & Co.'s Relief Fund

A unique relief fund is maintained by Jermyn & Co. at its collieries in Rendham, Penn. The source of revenue is the sale of the empty powder kegs for 8c. apiece. This sale nets the fund from $125 to $150 a month, and out of this sum it pays $1 a day to any of the men who are injured or ill.

Formerly the twelve hundred Jermyn & Co. employees took their empty powder kegs to the nearest saloon and exchanged them for drink, but now it would be impossible for an employee to take one off the property. The mine workers appreciate and take an interest in this unique relief fund and guard its interests jealously.

If a man is killed, every employee is called upon for a dollar, the company contributes $400, and the wife or nearest relative of the deceased is presented with a check for $1000. To the credit of the company be it said that there has been only one fatality in the course of the last two years, during which it has produced one million tons of coal. This record was made despite the fact that most of the coal was produced by the dangerous work of robbing pillars.

INSURANCE AGAINST ACCIDENTS AND MINE CAVES

In addition to the above provisions for its injured employees, the company pays from its insurance fund varying sums, dependent upon the seriousness of the injury, to all victims of accidents who break an arm or a leg, or suffer some other major injury. It also repairs free of charge all houses affected by mine caves.

There is an excellent reason for the low accident record of the company in the many safety devices in use at the Jermyn & Co. collieries. Directions, with an arrow pointing the way to safety, are posted in Italian, Russian, Polish, Slovenian, Spanish, Hungarian and Greek in the mines. All the machinery in the breakers is inclosed. Automatic blocks at the heads of the shafts hold back all but the car to be loaded on the cage, and are not released until the gates have been closed and the cage started. The trips of cars at the slopes are held on a sidetrack, and not switched onto the track leading down into the slope until the way is clear.

VILLAGE IMPROVEMENT AND SANITARY BATH HOUSES

Trim green lawns, flower beds and whitewashed fence posts and foundations all contribute to the attractive appearance of the collieries, and there is a hospital above ground as well as those required by law at the foot of the shafts, and a trained first-aid corps ready for instant service.

Another attraction is a wash-house with two hundred lockers, enough individual shower baths with hot and cold water to accommodate everyone without delay, concrete floors, sanitary drainage and ventilators. It is in charge of an old miner of thirty years' service, who, for $50 a month, scalds, washes and boils 500 towels a day, so that every man has fresh towels. Wire mats are provided in front of the lockers, and all diseased men are rigorously excluded. It is said that miners' wives urge their husbands to work for Jermyn & Co. At any rate, only 10 per cent. of the entire number of its employees are unmarried.

⁂

New Rescue Station at Herrin, Ill.

The mine-rescue car attached to the Benton station of the Illinois Mine-Rescue Station Commission has been ordered to Herrin, for the purpose of establishing a permanent substation at that city. Walter Scott, of Harrisburg, and Walter Nichols, of Benton, are to be in charge.

There are three mine-rescue stations under the control of the Commission. These are located at La Salle, Springfield and Benton respectively. Up to this time, a car has been attached to each station, so that the course of training and instruction might be taken by men who were unable to come to any of the three centers. The cars have been on the road for over three years, and that from Benton is the first to be given a permanent location. It is probable that the other two cars will be similarly located after the most suitable cities have been determined.

A committee representing the operators, miners and the city officials of Herrin met with the Mine-Rescue Commission at its last meeting, and presented the request of Herrin for the establishment of a substation. This committee consisted of James S. Reed, state mine inspector, William Burton, board member of the United Mine Workers of America, Mayor C. E. Anderson, of Herrin, Milo McGowan, J. F. Goalby and Evan D. John.

The car has been placed on the Chicago & Carterville spur, and has a telephone so that it may be called at any time. The city council of Herrin has placed two rooms in its new city hall at the disposal of Messrs. Scott and Nichols, and a large room on East Cherry St. has been fitted up for training work.

The next legislature will be asked to appropriate sufficient funds to establish a station at Herrin similar to those already erected at Benton, Springfield and La Salle.

Discussion By Readers

Mining Laws, Legislation and Mine Regulations

Letter No. 14—I believe a practical discussion of mining laws and a careful consideration of mine regulations, by practical miners, operators of long experience in coal mining and mine inspectors, as suggested in Coal Age, will be productive of good results. By this means, many valuable suggestions will be made, in reference to amending existing statutes or enacting new laws that will greatly simplify and facilitate the enforcement of these laws, in the operation of mines.

The safety of life and security of property do not depend so much, however, on legal enactments as on the observance and strict enforcement of wise and practical mine regulations. Many existing laws are not enforced or obeyed because of some objectionable features contained in them, which impose unnecessary burdens on either the miner or the operator. Although such laws may have seemed at first desirable; in their practical application they are not calculated to attain the end or purpose sought. Thoughtful and practical miners, superintendents and foremen are in a better position to understand what is required in the way of legislation, in order to safeguard the work of mining coal, than are the law makers themselves.

The mining law of Tennessee provides for certificates of two classes, Class A and Class B. The law also divides all coal mines into four classes; namely, Class A, including all gaseous mines; Class B, dusty mines; Class C, mines neither gaseous nor dusty, employing as many as 20 men; and Class D, the same as Class C, but employing less than 20 men. Class-A certificates are required of all foremen in charge of mines of the first two classes, while Class-B certificates enable the holder to act as foreman in mines of the two remaining classes.

My experience leads me to suggest that there should be three classes of certificates, A, B and C; and that a holder of Class-C certificate, making him eligible to foremanship in mines belonging to Classes C and D, should also be permitted to act as assistant foreman in mines of Class B. In like manner, a holder of a Class-B certificate, making him eligible for foremanship in mines of Class B, should be permitted to act as assistant foreman in mines of Class A; but in order to act as foreman in these mines he must first secure a Class-A certificate.

In respect to classification of mines and certificates, the present law of Tennessee works a hardship on the operator of a dry mine, generating no gas and employing but a few men. To operate this mine in compliance with the law, he must employ a foreman holding a Class-A certificate, while one holding a Class-B certificate would be just as competent to take charge.

In respect to examination for certificates of competency, the examining board in Tennessee is authorized by law to make any rules and regulations pertaining to the examination of candidates that they deem proper. It has been the custom with the present examining board to give one examination for *all* candidates, with the understanding that a candidate whose paper received a mark above 75 per cent. and who had had the necessary experience in gaseous mines, would be entitled to a Class-A certificate; while a candidate whose paper received a mark not below 60 per cent. would be entitled to a Class-B certificate. But any candidate whose mark fell below 60 per cent. would fail to pass the examination. It seems quite clear that better results would be obtained if the questions propounded were suited to the class of certificate the candidate desired to obtain, instead of expecting all candidates to answer the same questions.

The advantage of having three grades of certificates for mine foremen would be that the demand for Class-A certificates would thereby be reduced, while the standard of efficiency in the examination would be raised. Since it is merely the presence of explosive gas in a mine that makes it necessary to rate that mine as belonging to Class A, it is important that the foreman in charge of such a mine should pass a rigid test for a gas-boss certificate, to obtain which he must have a thorough knowledge of the dangers of mine gases. This knowledge would not be required of a foreman to take charge of mines belonging to Classes C and D.

My attention has been drawn to the question raised by Mine Foreman William Crooks, Edgewater, Ala. In his letter No. 5, Coal Age, Nov. 21, p. 839, Mr. Crooks asks how many mine inspectors dare to enforce those laws that are offensive to the large coal companies who were instrumental in securing their appointment. He states that the inspector who is appointed under such conditions cannot be expected to oppose the wishes of those responsible for his appointment. He speaks disparagingly of a candidate having a "good pull," or a "good stand in." Is it not true that most men holding positions of trust and honor have secured these positions through influence? It does not necessarily follow that this fact will cause him to neglect his official duty in the interest of those who have supported him. Mr. Crooks does not suggest a better method for the selection of mine inspectors. I fully believe that the appointment of mine inspectors by the governor is the best method that can be adopted, in the interest of safety for the miner.

In regard to the enforcement of existing laws, I would say that it is well nigh impossible to make a law so broad as to apply with equal justice to all the mines in the state. Owing to the constantly changing conditions in mines, it is necessary for the mine inspector and the mine foreman in charge, frequently, to use their best judgment. I will say that in Tennessee the chief mine inspector's ruling or judgment is law in many instances.

In closing, I want to emphasize the importance of the point already suggested that the examination of the mine should be made by the gas bosses *within three hours of the time for the men to commence work* and that evidence of their examination should be left at the face of each working place. This is the law in Tennessee and it needs little to be added in this respect. The Tennessee law also states that there shall be employed one or more gas bosses, as conditions, extent of workings and other circumstances may require. This provision of the mining law of a state, together with honest and competent inspection, will go far toward reducing mine accidents.

JOHN ROSE,
District Mine Inspector.

Dayton, Tenn.

Letter No. 15—For the past 13 years, the mines in Iowa have been operated under what is known as the "shot examiners' law." This law requires that, in all mines where coal is blasted from the solid, competent persons shall be employed to examine all holes before they are charged. The law authorizes the examiner to prohibit the charging and firing of any shot that in his judgment would be unsafe. It requires the state mine inspector of the district to certify to the mine operators in his district such persons who have proved to him their competency to act as shot examiners.

Notwithstanding the opposition that was met in the passage of this law, I believe I am correct in stating that the good results brought about since, by its operation, have caused a unanimity of opinion on the subject; and the need of employing shotfirers, acting under the same authority as shot examiners, is now no longer in dispute. I believe that this conclusion has been reached in the mind of every considerate mining man. Under the present system, the examination and firing of shots by different persons naturally give rise to a conflict of interest; and it is this condition that suggests the wisdom of enacting a law that will compel all operators of coal mines to employ shotfirers as well as shot examiners, and to have all shots fired by them after other employees have left the mine.

In my recent report, contained in the 17th biennial report of the state mine inspectors of Iowa, for the two years ending June 30, 1914, pp. 61-65, I have recommended the enactment of a law by which all shots should be examined and fired by one and the same party, who should be subject only to state regulation in the performance of his duties. It is a foregone conclusion that as long as the practice of "shooting off the solid" is permitted in the mines of Iowa, the old-time system of every miner firing his own shots will be forever banished.

The dual authority under which the mine examiners and shotfirers have, for a long time, acted, has been a bitter bone of contention between the operators and miners of this state; and it is earnestly hoped that the enactment of a new law making it compulsory for all shots to be examined and fired by a competent person authorized by the mine inspector and employed by the coal company will forever put an end to the present controversy.

R. T. RHYS,
State Mine Inspector, Dist. No. 2.

Ottumwa, Iowa.

Letter No. 16—The interesting discussion now being conducted in COAL AGE calls to mind an incident in my own experience as mine inspector in Iowa, a few years ago. At that time, I was notified by the inspector of Missouri that the workings of a certain mine in his district had been extended across the state line into Iowa. He stated that, according to the decision of the attorney-general of Missouri, his jurisdiction terminated at the state boundary line. For this reason, he requested me to look after that portion of the mine that was located in Iowa.

It naturally occurred to me that if the Missouri mine inspector had no jurisdiction over that portion of the mine in Iowa, I would have no jurisdiction over that portion located in Missouri. Under these circumstances, it appeared that the proper inspection of the mine and enforcement of the mining laws of either state would be somewhat difficult. I, therefore, placed the matter before the attorney-general of Iowa, whose decision, as I had supposed, gave me no jurisdiction beyond the state line.

Looking further into the matter to find, if possible, a precedent that would serve as a guide in such cases, I found that a similar opinion had been rendered by the attorney-general of Ohio, in regard to a mine in *that* state which had been extended across the boundary into West Virginia. The coal mined from this property in West Virginia was hoisted in Ohio, where all the surface equipment, air shafts and ventilating machinery were located. The mine generated gas.

Upon the application of the Ohio mine inspector, the attorney-general of that state decided that the mine inspectors, in either state, respectively, had no jurisdiction beyond the state line. It is well known that the safety of the entire mine often depends on the conditions that exist in a single portion or district of the mine; and the lack of jurisdiction over the whole mine makes it practically impossible for either of the mine inspectors concerned in the inspection of an interstate mine to guarantee the operation of the mine in full compliance with the laws of his state.

Recognizing this fact, the attorney-general of Ohio suggested that the Ohio inspector should arrange with the mine inspector of West Virginia to examine the mine at the same time, each confining his inspection to that portion of the mine within his own jurisdiction. After making the examination, the two inspectors could then compare notes and, if possible, reach a satisfactory conclusion in regard to what each considered necessary for the safe operation of the mine. In doing this, however, it might happen that either or both of the inspectors would be compelled to disregard some of the requirements of the mining laws of their respective states.

Considered from the standpoint of the safety of human life and the security of property, and remembering that explosions, fires, squeezes and sudden inrushes of water or gas do not respect state lines, in an interstate mine, there is every reason why the inspection of such a mine should be untrammeled and in no way embarrassed or hindered by differences in the requirements of the respective state laws.

Allowing that the decision of the attorneys-general, in these cases, is in conformity with the general laws of state jurisdiction, it has been suggested that the problem of the inspection of interstate mines could be solved by placing such mines under Federal supervision. Another suggestion is that either state inspector should be given full jurisdiction over the entire mine by interstate agreement.

So far as I know, the mining law of every coal-producing state gives the mine inspector the power to call out the men from any portion of the mine that, in his judgment, presents unsafe conditions. Under this provision of the mining law, the refusal of the operator of an interstate mine to voluntarily concede to the request and instructions of the mine inspector of a border state.

having jurisdiction over a portion of the extended workings of said mine, would be sufficient reason to warrant said mine inspector's withdrawing the men from that portion of the mine. In the event of his order being disobeyed, he could apply to the courts of his state for an injunction forbidding the working of that portion of the mine in his jurisdiction.

In my own case, to which I have referred, I notified the operator before going to the mine that I expected him to give me jurisdiction over the entire mine to the extent that would enable me to protect the men working in Iowa, as required by the mining laws of that state. This was granted, and requests for several improvements of the surface equipment located in Missouri were fully complied with and results were satisfactory to all.

JOHN VERNER.

Chariton, Iowa.

Letter No. 17—There is no question but that the mining laws of Kansas can be improved, in many respects; but it goes without saying that there would be fewer accidents occurring in the mines if the present mining laws were enforced and obeyed.

The law in respect to the undermining and shearing or cutting of coal before firing a shot is very specific. The law makes it a misdemeanor for a miner to drill a hole or fire a shot, at the face of any room or entry, until the coal intended to be broken down by the shot has been undermined to a depth of at least 2 ft. and sheared or sidecut the full thickness of the seam, to a depth equal to that of the hole. The law also provides that the width of the shot at the back of the hole shall not be greater than the width between the mouth of the hole and the sidecut. The law provides a fine for anyone guilty of such misdemeanor.

This law was intended to reduce the number of blown-out shots that occur as a result of "shooting the coal off the solid" without undermining or cutting. I regret to say that the law is almost entirely disregarded. Some unscrupulous miners still continue to drill their holes on the solid and overcharge them, in spite of this warning. In my opinion, the only way to do away with this dangerous practice is to employ competent shotfirers, and instruct them to tamp all shots in entries or roomnecks and other narrow work themselves; and not to fire any shots that, in their judgment, are liable to cause an accident.

Another dangerous practice, much followed in Kansas mines, is the use of dynamite for shooting coal. This practice also is contrary to the mining law of the state, which prohibits the use of dynamite or other detonating explosives for blasting coal in the mines of the state. The law provides, however, that dynamite or other detonating explosives may be used under such rules and regulations as may be agreed upon between the employers and the employees. This provision practically annuls the law and, in my opinion, should be eliminated from the statute.

By such a provision, the responsibility for an accident due to the use of dynamite in blasting coal rests on the mine foreman and the mine committee. It is often a difficult matter for the foreman and the committee to come to any agreement as to the amount of dynamite that can be used with safety, in a particular place. However, as the miner is not compelled to purchase his dynamite at the mine, he often secures an extra supply unknown to the foreman and the committee. The result is that an excessive amount of dynamite is frequently used.

It is a very common practice here to mix dynamite and black powder, in the same hole. It cannot be denied that, in general, this is a dangerous practice, although some experienced miners frequently use a small piece of dynamite, at the bottom of the hole, to break the coal more readily at that point. I may say that the use of dynamite, in Kansas mines, dates back but a few years, when it was introduced by some unskilled miners; but the practice has grown to considerable proportions and should be abolished.

The state law of Kansas can be improved, in respect to the selection of mine inspectors. Candidates for this office should be made to pass a very rigid examination before a properly authorized and constituted mining board. Such an examining board should be composed of representatives of the operators and miners, who should coöperate in preparing an examination that would determine both the theoretical and practical knowledge and the ability of each candidate. Whether the mine inspector is appointed by the governor or elected by the miners, he should be chosen from persons who have passed a successful examination and been certified by the examining board, as required by law.

In my opinion, the law should also provide for the examination and certification of mine foremen, firebosses and hoisting engineers. Inasmuch as these positions are the most responsible ones in the operation of a coal mine, the persons filling them should possess sufficient technical education and practical knowledge and experience as to fit them for the proper discharge of their duties.

⁂

The Foreigner in Mining

Letter No. 11—Referring to Mr. Parfitt's second letter, COAL AGE, Nov. 21, p. 841, in which he explains his deductions as based on "an ethical analysis of the characteristic traits of the foreign element," I want to say that, even on such a basis, his conclusions are erroneous and his statements far too sweeping. I feel this would voice the sentiment of a large majority of mine officials, whose experience with this class of labor, like my own, has extended over many years.

I understand an *analysis* to mean an unraveling process by which one discovers the original elements or the cause of known facts. But Mr. Parfitt's reasoning is *a priori*, or from cause to effect. He shows that the early training and environment of the foreigner have developed a character for deception, immorality, ignorance, etc. In addition to these characteristics, in a second letter, he adds the element of untruthfulness when he states, "Obviously their answer was contrary to their practical belief."

The ability to render a just verdict on a question as large as the one under discussion requires much close study. Years of observation are necessary before one can appreciate the foreigner and understand him sufficiently to give an opinion that is untainted with prejudice. Without this knowledge, any criticism of his mental processes bids fair to be as unjust as it is superficial.

In reference to their holidays, which they celebrate with evident loyalty, the act only shows their love for the land of their fathers. The recurrence of these holidays is as dear to them as that of the Fourth of July or other holidays are to Americans. In our judgment of the foreigner, we must not forget that, in spite of these sporadic celebrations, the production of coal in this country, which has come to be so dependent on foreign labor is the wonder and admiration of the world.

Every intelligent person who is interested in our country's industrial supremacy knows that a loss of even 50 per cent. of the foreign labor employed in the mills and mines of the country would be an irremediable loss. Taking it as granted that foreign labor constitutes so valuable an asset in our industries, it should be our aim and constant endeavor, by precept and example, to cultivate a fraternal feeling for the foreigner, rather than to create a sentiment inimical to him.

Recognizing our dependence on foreign labor I am glad to say that it is, at present, by no means the intricate problem it was 25 or 30 years ago. At that time, few of these foreigners spoke English; and no English-speaking miner would accept of a foreigner as his "butty." When the foreigner went into the mine, he was compelled to work by himself, often at the risk of his life. It was this fact that retarded the work of assimilating foreign labor and utilizing it for the mining of coal. The process has been slow; but time and their own earnest endeavors, assisted by those foremen who have taken a personal interest in them, are rapidly bringing the question of their availability to a successful issue. Now, there are thousands of foreign miners working in our mines who can mine coal as well as the old-time miners whom they have replaced.

A wise foreman places a new arrival in charge of an experienced compatriot, who gives him the necessary instructions, until he is able to mine coal by himself. Interpreters are found in almost every mine, who explain orders to those who do not understand.

In Mr. Parfitt's previous letter, he regarded the education of the foreigner as a "herculean task," and finally declared it to be "impracticable"; but, in his second letter, he recants and says "He is still capable of mental education." The fact that so many of these foreigners are now returning home to take part in the war is, to my mind, evidence that they desire the same freedom for their homeland that they have enjoyed here in America. Their return, at this time, to assist their homeland in one of the bloodiest wars of history, deserting their present opportunities for advancement and gain, in exchange for peril and probable death, strengthens my opinion and admiration of them, and forces me to the conclusion that they are excellent material with which to make good American citizens.

Charlton Dixon.

Study Course in Coal Mining

By J. T. Beard

The Coal Age Pocket Book

THE CIRCLE

The **circle** is a plane figure bounded by a curved line, called its **circumference,** every **point** of which is equally distant from a point within which is its **center.**

A straight line drawn from the center to any point in the circumference of a circle is its **radius.**

A straight line joining any two points in the circumference and passing through the center of the circle is its **diameter.** If such line does not pass through the center, however, it is a **chord.**

A straight line touching the circumference of a circle in a single point only, however far it may be produced in either direction, is **tangent** to the circle at that point. A tangent to a circle is always perpendicular to the radius drawn to the point of tangency.

THE ELLIPSE

The ellipse is a plane figure bounded by a curved line such that the sum of the distances of any point of the curve from two fixed points within called the **foci** is constant. This sum is equal to the length of the **major axis,** which is the straight line passing through the foci and terminated by the curve. The bounding curve is the **perimeter** or **circumference** of the ellipse.

The point on the major axis midway between the foci is the **center** of the ellipse. Any straight line passing through the center and terminated by the circumference is a **diameter.** The diameter at right angles to the major axis is the **minor axis** of the ellipse.

The points in which a diameter meets the circumference are **vertices,** the ends of the major axis being the **principal vertices** of the ellipse.

NOTE—The terms "circle" and "ellipse," as used, often refer to the bounding line or circumference of the figure instead of to the figure itself.

MENSURATION

Mensuration is that branch of applied geometry that treats of the calculation of the lengths of lines, the areas of surfaces and the volumes of solids. The following formulas are of the most general application:

The Triangle—Denote the three angles by A, B, C; and the sides lying opposite to them by a, b, c, respectively.

$$A + B + C = 180°$$

$$a : b :: \sin A : \sin B$$

$$\frac{a}{b} = \frac{\sin A}{\sin B}$$

The proportionality of any two sides of a triangle to the sines of their opposite angles; or, in other words, the equality of the ratios of any two sides of a triangle and that of the sines of their opposite angles is one of the most useful principles in the solution of triangles, and the one most frequently used in the practice of surveying.

The Coal Age Pocket Book

The solution of a triangle is always possible when three parts are given or known, provided one of these is a side. It is possible to form but one triangle with three given lines or sides; but, with three given angles, an infinite number of triangles can be formed. Hence the necessity of knowing at least one side.

The solution of triangles presents four cases requiring separate treatment for each case; namely,

1. Given two angles and any one side.
2. Given two sides and an angle opposite one of them.
3. Given two sides and the included angle.
4. Given any two parts of a right triangle.

Cases 1 and 2—The first two of the above cases are solved by applying the formulas just given depending on the ratio of any side to the sine of the opposite angle, as shown by the following examples:

Example—Given, in a triangle, A = 40 deg., B = 30 deg. and b = 100 ft.; to find the other parts of the triangle.

Solution—The third angle is C = 180 — (40 + 30) = 110°. The remaining sides are

$$a = \frac{\sin A}{\sin B} \times b = \frac{\sin 40°}{\sin 30°} \times 100 = \frac{0.6428 \times 100}{0.5} = 128.56\ ft.$$

$$c = \frac{\sin C}{\sin B} \times b = \frac{\sin 110°}{\sin 30°} \times 100 = \frac{0.9397 \times 100}{0.5} = 187.94\ ft.$$

Example—Given, in a triangle, B = 45 deg.; b = 400 ft. and c = 250 ft.; to find A, C and a.

Solution—The remaining angles are first found; thus,

$$\sin C = \frac{c}{b} \times \sin B = \frac{250}{400} \times \sin 45° = \frac{5 \times 0.7071}{8} = 0.44194;$$

and $C = 26° 14'$, *nearly*

Then, $A = 180 - (45° + 26° 14') = 108° 46'$

The unknown side can now be found; thus,

$$a = \frac{\sin A}{\sin B} \times b = \frac{\sin 108° 46'}{\sin 45°} \times 400 = \frac{0.94684 \times 400}{0.70711} = 535.61\ ft.$$

This principle, which is called the **law of sines,** can always be applied when two angles and any side are given; but when two sides and only one angle are given it cannot be applied; unless the given angle lies opposite one of the given sides, or the triangle is a right triangle.

Case 3—When two sides and the included angle are given, there are two methods of solution, as follows:

1. The half difference and half sum of the other two angles are first found by the formulas

Half difference, $\tan \frac{1}{2} (A - B) = \frac{a - b}{a + b} \tan \frac{1}{2} (A + B)$

Half sum, $\frac{1}{2} (A + B) = \frac{1}{2} (180° - C)$

Having found the half sum and the half difference, add these together to obtain the greater angle; and subtract the half difference from the half sum to obtain the lesser angle.

Inquiries of General Interest

Humidifying Mine Air

We have to contend with a serious proposition, in our mines, in respect to keeping the mine moist to prevent the drying out of the dust and avoid the dangers resulting therefrom. I would like to get the views of the readers of Coal Age as to the proper method to pursue to accomplish the necessary humidification of the mine air. The facts, in our case, are as follows:

The mine is ventilated by a blowdown fan and the exhaust steam from the fan engine is discharged into the downcast shaft. Experiments have shown, however, that the dampness or degree of humidity imparted to the air current by the exhaust steam is practically lost at a distance of 600 ft. from the bottom of the downcast shaft.

Inasmuch as the live workings are located at a distance of 4000 ft. inby from this point, it will appear that we are deriving no benefit from the steam exhausted into the downcast shaft. The plan has not accomplished the purpose intended and the results are not what were anticipated.

I want to ask, What is the best method of accomplishing the necessary humidification of the air current passing through the live workings of this mine? Can this be accomplished by passing the air current through a film of water at the point of distribution of the air; and will sufficient moisture be absorbed, by that means, to keep the dust below the point of ignition?

Another plan that has been suggested and considered is to install a line of pipe in the main-intake air course, with plugs at every 200 ft., to which could be attached a hose 100 ft. long. The pressure on the pipe line would be about 104 lb. per sq.in. Will this method furnish sufficient moisture to dampen the dust and render the mine safe, in this respect?

MINER.

Caldwell, Ohio.

In considering a proposition of this nature, it must be remembered that the capacity of air for carrying moisture will depend on the temperature of the air. The average temperature of a mine is generally above that of the outside atmosphere. This is always true in the winter season, which is the most important period in the production of coal. Therefore, although the air current entering the mine may be fully saturated with moisture, owing to the discharge of the exhaust steam of the fan engine into the downcast shaft, this saturated intake current, on assuming the higher temperature of the mine, soon becomes comparatively dry, because the weight of moisture that saturated it at the lower temperature of the outside air is insufficient for saturation at the higher temperature of the mine.

For the sake of illustration, let us first estimate roughly the weight of moisture in the exhaust steam. For this purpose, assume that a current of 100,000 cu.ft. per min. is passing into the mine, under a water gage of 2 in. Then, taking the general efficiency of the circulation as 60 per cent., the indicated horsepower of the engine necessary to supply this circulation is

$$H = \frac{100,000 \times 2 \times 5.2}{0.60 \times 33,000} = \textit{say } 50 \textit{ hp.}$$

Now, assuming a water consumption of 30 lb. per hp. per hr., for a feed-water temperature of 100 deg. F. and a gage pressure of 70 lb., the weight of steam exhausted into the shaft is, on this basis, 50 × 30 = 1500 lb. per hour.

Assume, further, for the sake of calculation, that the outside temperature is 40 deg. F. and the relative humidity of the outside air 50 per cent. Then, since the vapor pressure, at this temperature, is 0.1216 lb. per sq.in., the weight of water vapor necessary to saturate an intake current of 100,000 cu.ft. per min., is

$$W = \frac{0.6235 \times 0.50 \times 0.1216 \times 100,000 \times 60}{0.37\ (460 + 40)}$$
$$= \textit{say } 1230 \textit{ lb. per hr.}$$

From this it is seen that the weight of steam assumed to be discharged into the downcast shaft is more than sufficient to saturate this air current, under the assumed conditions. Indeed, it would saturate this intake current, even assuming an outside humidity of 40 per cent. at the given temperature.

Now, assuming the temperature of the live workings to be, say 70 deg. F., we may ask, How much moisture will be absorbed from the mine workings by this air current, which was saturated in the downcast shaft, at a temperature of 40 deg. F., but reaches a temperature of 70 deg. F., in its passage through the mine? The vapor pressure at the mine temperature (70 deg. F.) is 0.3602 lb. per sq.in.; and, remembering that the volume of air in circulation varies with its absolute temperature, the quantity of water or moisture absorbed from the live workings by a current of 100,000 cu.ft. per min. is found as follows:

$$W = \frac{0.6235 \times 0.3602 \times 100,000 \times 60}{0.37\ (460 + 40)\ 8\frac{1}{3}} = 874 \textit{ gal. per hr.}$$

This quantity of water represents a weight of 7285 lb., or 3.64 tons, which will be absorbed from the live workings each hour by an air current of 100,000 cu.ft. per min., under the assumed conditions. The result shows the enormous drying power of such an air current. It also shows, with more or less accuracy, the volume of water that would have to be sprayed into the current, through a pipe line, in order to maintain a uniformly continuous condition of the mine with respect to moisture, assuming no drainage from the overlying strata and the full saturation of the return air current.

One of the best methods that has been suggested for the practical humidification of the mine air throughout the mine is a pipe-line system with fine sprays of air arranged at regular intervals along the pipe line. If such a system is installed on an intelligent basis, in accordance with the existing conditions in the mine, good results may be expected.

Examination Questions

Miscellaneous Questions

(Answered by Request)

Ques.—Under what conditions may afterdamp become explosive?

Ans.—It frequently happens, under the varying conditions in mines, that the afterdamp of the mine explosion contains much unburned methane (marsh gas); and, frequently, much carbon monoxide is present. The addition of fresh air to afterdamp containing these gases will render the mixture highly explosive.

Ques.—What conditions, other than the volume of air passing through the fan or furnace, should a mine foreman consider in order to determine whether the mine is properly ventilated?

Ans.—Assuming that the volume of air passing into the mine is sufficient to meet the requirements of the mine law, it is important to ascertain its relative humidity. The intake air current should be brought, as nearly as possible, to a state of saturation, in order to prevent the absorption of moisture from the dust accumulated in the entries and workings of the mine, which always takes place when passing a comparatively dry air current through the mine. It is also necessary to see that the entire quantity of air, as far as practicable, is conducted forward and made to sweep the working face; and to so distribute the air that the velocity of the current, at the working face, will be sufficient to carry away the gases that would otherwise accumulate and yet not be so great as to make the use of safety lamps dangerous.

Ques.—In what parts of a mine are accumulations of dust more dangerous than in others, and why?

Ans.—Accumulations of dust on the intake airways are more dangerous than on the return, because the dust is then carried into the mine by the air current. Also, accumulations of dust in proximity to the face of the coal are always dangerous, in case blasting is done in the mines. All such accumulations of dust should be carefully removed, and the roof, floor and sides of the place thoroughly sprinkled before blasting is done; otherwise, the dry dust may be blown into the air by the force of a blast and ignited by its flame, causing a local explosion of dust that may, under favorable conditions, be propagated throughout the mine.

Ques.—State how the several mine gases may be detected; in what proportions in the air they are fatal to life; and in what proportions they will extinguish light.

Ans.—This question cannot be answered with absolute accuracy, owing to the difference in the effect of mine gases on persons of different temperament and on lamps burning different oils. Moreover, the results are varied considerably by the presence of other gases or dust. However, methane or marsh gas (CH_4), which is detected in mines by its effect on the flame of a safety lamp, may be regarded as being fatal to life when it much exceeds 50 per cent. of the air breathed. At this point, the oxygen of the air will be reduced to about 10 per cent. of the mixture, which is generally considered as fatal to life. The percentage of methane required to extinguish the flame of a candle, in otherwise pure air, is about 16.7 per cent.

Carbon monoxide present in mine air may be detected by what is known as the "blood test," in which two or three drops of blood in an ounce of water is colored a buff-yellow when air containing this gas is passed through the solution. A better test, however, is the effect of this gas on small animals, such as mice or birds, which become prostrated in, perhaps, one-twentieth of the time necessary to produce a similar effect on human life. The effect of this gas is cumulative when breathed into the lungs, and a mixture of otherwise pure air containing 0.5 per cent. of carbon monoxide will generally produce fatal effects when breathed. The gas is not extinctive of flame.

Carbon dioxide, when present in mine air, is best detected by its effect, which is to dim or extinguish the flame of a lamp. When breathed in sufficient quantities, a considerable length of time, the gas produces dizziness, headache and nausea. Assuming carbon dioxide to be added to otherwise pure air, a candle flame is first extinguished by it when this gas forms 13.4 per cent. of the mixture. The mixture, however, does not necessarily become fatal to life until the gas reaches 18 per cent.

Hydrogen sulphide (H_2S) is generally detected in mines by its smell, which resembles that of rotten eggs. Otherwise pure air containing only 1 per cent. of hydrogen sulphide is generally fatal to life when breathed but a short time. This gas contains no oxygen and it is probable that when from 16 to 18 per cent. of it is present in otherwise pure air, the mixture would extinguish the flame of a candle.

Ques.—State the conditions under which the presence of the various mine gases may be expected.

Ans.—Methane may be expected in the live workings of mines generating this gas, particularly in the rise workings of the mines and in proximity to faults. Carbon monoxide may be expected where gob fires are in progress or slow combustion is taking place where the ventilation of the mine is deficient. Carbon dioxide may be expected in all cases where the mine is improperly ventilated, especially in dip workings. Hydrogen sulphide is seldom found in appreciable quantities in coal mines.

Ques.—State the volume of each of the principal gases composing atmospheric air.

Ans.—Atmospheric air is composed of two principal gases, which are mixed in the proportion of one volume of oxygen to four volumes of nitrogen, practically.

Ques.—In the event of a severe explosion in a mine, what would be your first consideration and duty as mine foreman in charge of the underground operations?

Ans.—The rescue of any possible survivors entombed in the mine. To accomplish this, it would be the mine foreman's duty to organize and equip, in the shortest possible time, a volunteer rescue corps of experienced miners; and having made any necessary repairs to the ventilating equipment, to lead the work of rescue in the mine.

Coal and Coke News

Harrisburg, Penn.

Returns of anthracite tonnage with the value and per capita amount due were completed by the Auditor General, on Dec. 26.

The figures are for the first 6 months of the Rony Act, or from July to December, inclusive, 1913. The report shows for that period that 34,528,794 tons were prepared for market and sold representing a value of $92,144,050.50.

This law imposes an ad valorem tax of 2½ per cent. on coal prepared for market (not including coal run through washeries). Half of this tax goes to the state and half to the county where the coal is mined. The money received by the county is to be distributed under the law to each municipality therein, the proportion received by each city, borough or township being based on the population reported in the 1910 census.

The pro rata share of the money provided for the municipalities is due each and every political division of the bailiwick whether coal is mined within its borders or not. In fact, some municipalities that haven't a pound of coal will receive under this coal tax law more revenue than their present duplicates return. This is one of the features attacked by the operators in the suit now pending.

The tax money is now held in trust by the various coal operators pending the adjudication of the question of constitutionality of the act, Jan. 4 having been set for argument in the Dauphin County courts.

It is contended by the operators that the tax is a special one and cannot under the Constitution be levied: that the tax is assessed after the coal has been shipped out of the state this method being illegal as well as the payment of the money to municipalities in which no coal is mined.

Miners to Formulate Legislation

For the first time in the history of the organisation a meeting of the executive boards of five districts of United Mine Workers in Pennsylvania will be held in Harrisburg in January for the consideration of legislation interesting the miners and which is to come before the 1915 legislature. It is planned to have the miners concentrate their energies on having their legislation put through this meeting of the state's law makers.

Already the anthracite district boards in Districts 1, 7 and 9 have held several meetings and outlined the bills they will fight for.

The plan now is to have the two bituminous districts Nos. 2 at Altoona and 5 at Pittsburgh join their influences with the anthracite miners. It is expected that the efforts of the state mine workers will center on the workmen's compensation, employee's liability and child labor. The meeting will probably be called about the 21st of January.

PENNSYLVANIA

Anthracite

Wilkes-Barre—Members of the Tri-District Board of the United Mine Workers of America in session here recently started a movement for the elimination of wooden cages in shafts, and the substitution of all-steel ones. Officials of the board who investigated the recent Tripp accident, believe that similar catastrophes of this kind might be averted by the use of all-steel cages.

At a recent meeting of the Anthracite Conciliation Board, nine petty cases were referred to Umpire Gray, of Philadelphia, and three others acted upon, one of which was decided in favor of the employees, and two sustaining the company.

Scranton—Scranton will receive about $200,000 through the operation of the Roney tonnage tax on coal for 1913, provided, of course, that this measure is held to be legal. It is probable that the 1914 report of coal mining will show somewhat of an increase over that of 1913, with a corresponding increase in the amount of the tax.

Shenandoah—Four miners were badly burned in a gas explosion which occurred at the Stanton colliery on the evening of Dec. 24. Two are thought to be fatally injured while the others may lose their sight. The explosion occurred at quitting time just as the miners were leaving the workings.

Selinsgrove—Northumberland County Commissioners and officials of Coal township have joined in filing an answer to the petition of the Philadelphia & Reading Coal & Iron Co., the Mineral Railroad & Mining Co., and the Lehigh Coal Co., which recently petitioned for an injunction. These firms seek to prevent the enforcement of the collection of coal taxes for 1913, amounting to $73,001.27, which it is claimed is excessive.

Shamokin—After having been idle for some time because the officials of the Pennsylvania R.R. increased the fare of the miners riding to and from work, the 900 employees of the Hickory Ridge and Hickory Swamp collieries recently returned to work. The men received assurances from the railroad officials that the company is willing to lower the rate of fare to the original figure, but before this change can be made it is necessary to receive the approval of the Public Service Commission.

Pottsville—Four collieries were recently closed down for about three weeks for needed repairs and improvements. This throws approximately 1600 men and boys out of employment.

Tamaqua—Being unable to check the fire now burning in part of No. 9 mine, the Lehigh Coal & Navigation Co. has decided to sink a temporary shaft, and in order to prevent a further spread of the flames to flood the workings where the fire exists.

Lansford—The Lehigh Coal & Navigation Co.'s No. 6 boiler house was burned to the ground on Dec. 25. From 3000 to 4000 men and boys are out of employment as the boilers furnished steam for No. 6 Breaker and a half dozen underground operations.

Bituminous

Connellsville—Twelve hundred coke ovens in the Connellsville region that have been banked for some time were relighted Dec. 26. Three hundred and fifty merchant ovens are shortly to be added to the active list, with the prospect that still more will be fired early in January. The weekly production of coke remains, however, around 200,000 tons, but this will probably increase as conditions in the steel industry are improving, and coke operators are consequently hopeful of a better future market.

Point Marion—An explosion in the cellar of the storeroom of the Fancy Hill Coal Co., located between here and Cheat Haven, burned the office building and store to the ground. The loss was approximately $10,000. Employees promptly formed a bucket brigade, but an inadequate supply of water prevented the firefighters from making progress against the flames. Work of reconstruction will be begun immediately.

Latrobe—The United States Steel Corporation has determined that there will be no general reduction of wages by the corporation or none at the first of the year at least. Such decreases in the general wage scale have been considered and have seemed at times imminent, but according to the statement of the officials, the existing scale will be continued for the present at least, and hopes are entertained that improvement in business will be realized shortly.

Brownsville—It is stated that information received from reliable sources indicates that the officials of the Century Coal & Coke Co. are planning to resume operations at their plant near Brownsville at 85 per cent. capacity on or about Jan. 1, or as soon thereafter as is possible.

WEST VIRGINIA

Fairmont—The general store of the New Central Coal & Coke Co., at Baxter, was totally destroyed by fire on the morning of Dec. 21, entailing a loss of about $25,000. John Jackson, manager of the store, and his family were rescued from the third floor of the building with difficulty, being compelled to descend ropes made of blankets, comforts, etc. The water plugs near the building were frozen up, which handicapped the fire department to a considerable extent. The origin of the fire is unknown.

Gary—Mine Rescue Car No. 8 is now at Gary and has started in on a successful training campaign at that point. Every possible coöperation to the car's crew has been given, and 55 men are taking a complete course of training in mine-rescue and first-aid work. This large number will necessitate an extension of the car's stop at this point, and the car will probably remain here until Jan. 4, after which it will proceed to Davy.

Kingwood—It is freely intimated around this vicinity that the Elkins mines as well as those located elsewhere along the Morgantown & Kingwood R.R., will resume operations shortly after Jan. 1. These mines have been closed or working only half time for several months, and when in operation give employment to several hundred men, all of whom are anxious to see the mines start up again.

ALABAMA

Birmingham—The Alabama Coal Operators' Association has been advised that the Interstate Commerce Commission has suspended the advance rate on coal from Alabama mines to Memphis, New Orleans and other points in the Mississippi valley, which the railroads had petitioned to have put on Jan. 1. The advance asked for was from 15 to 30 cents per ton over present prices. A date for a hearing before the Commission will be fixed early in the year. Pending the investigation the old rate will remain in force. The railroads that joined in the petition were the Illinois Central, the Louisville & Nashville, the Mobile & Ohio and the Frisco. The operators and shippers are encouraged and believe they will win the fight on the merits of their case when a hearing is given.

KENTUCKY

Harlan—This city, according to the Commercial Club, is making a more rapid growth than any other community in Kentucky and is guaranteeing an interest of 6 per cent. on an investment of $25,000 for a water works to any person who will install such a plant. The coal resources of the county explain the city's growth. There are 12 mines already producing while 8 others are to be opened in the immediate future.

St. Charles—The Carbondale Coal Co., with mines two miles north of here, has suspended operations. The reason for this suspension has not been given but report connects it with the "Possum Hunters" activities of several weeks ago when four white men were shot at this camp and all the negroes driven away.

Earlington—The St. Bernard Mining Co. reports for the week ending Dec. 19 the best week in its history in this district, shipments having totaled 887 cars of coal and 36 cars of coke.

Barbourville—There has been a large increase recently in the number of electrically operated mines in the Knox County field. Several of the operators took advantage of the dull period of the last few weeks to install electrical equipment, in preparation for greatly increasing their outputs.

OHIO

Columbus—J. M. Roan, chief deputy and safety commissioner of mines of Ohio, has recently issued Bulletin No. 12 calling attention to three fatal and one serious accident in Ohio mines during the past month. In each case remarks are made showing how the accident in question could have been prevented. The accident was the fault of the miner in every case.

INDIANA

Boonville—The Sunlight Coal Co. has ready for use a fourth large stripping machine, and expects when this is working properly to be able to load more than 50 cars of coal per day. The dipper holds about 1½ tons of coal, and cars can be loaded on an average of one every 15 minutes. Three other machines are now in use, two of which are used to strip the coal, while the other loads it.

ILLINOIS

Pana—Fire has broken out again at the Taylor Springs mine west of here, and the operation is in a serious condition. A mine fire started 18 months ago, and it was supposed that it had been confined to a section that had been bricked and cemented in.

Belleville—On account of the large number of mines of this section that have been idle on account of no market for their coal, the mayor and other business men of the city held a meeting to complain to the Interstate Commerce Commission, asking it to fix rates on coal from Belleville to interstate points, so that the local mines can operate.

Princeton—A judgment for $18,500 was recently awarded in the Superior Court of Cook County in favor of Fred De Filippe, of Spring Valley, who lost his leg about four years ago in the No. 1 mine of the Spring Valley Coal Co. The coal company has, however, taken an appeal to the Supreme Court.

Harrisburg—Through the petition of citizens, the Commercial Club and miners' organization, the O'Gara Coal Co. recently agreed to start Mine No. 4. Mines Nos. 3 and 4 have been idle for many months, and the employees at these operations who were thrown out of work have been reduced in some cases to actual suffering. All idle men who were formerly employed will be given preference in the work.

COLORADO

Denver—The gradual withdrawal of Federal troops from the Colorado coal fields, where they have been on strike duty since April last, will begin shortly. The troops stationed in Routt County will be the first to go. These will be followed by those in Boulder, Weld and Freemont Counties. It is intimated that some time may elapse before all the Federal forces now in Las Animas and Huerfano Counties in southern Colorado will be withdrawn.

FOREIGN NEWS

Pictou, Nova Scotia—Thomas Blackwood, deputy inspector of mines, and James Brown, mine superintendent of the Acadia Coal Co., were killed in an explosion in Allen's Shaft No. 1 recently. Alexander Sutherland, manager of the mine, and Neil McLane, a foreman, were also in the mine at the time of the explosion, and nearly lost their lives.

PERSONALS

W. C. Bonham has been appointed trustee for the American Coöperative Coal Co., who recently filed a petition in bankruptcy at Birmingham, Ala.

George G. Crawford, president of the Tennessee Coal & Iron Co., has returned to Birmingham from New York after attending a meeting of presidents of subsidiary organizations of the Steel Corporation. He says indications point to a general revival of business.

Neil Robinson, consulting engineer, of Charleston, W. Va., and receiver for the LaFollette Coal, Iron & Ry. Co., has been confined to his home in Charleston for the past three weeks with valvular heart trouble. He is improving, but will not be at LaFollette for a few days.

The vacancy created by the resignation of Fred W. Minton as sales agent of the Philadelphia & Reading Coal & Iron Co. at Detroit has been filled by the appointment of William A. Reed, who has represented the same company for several years in Ohio. The changes take place on the first of January.

James B. Neal, president and general manager of the Buck Run Coal Co., recently had suit brought against him by one of the hoisting engineers of the colliery, the charge being that the hoisting engineers were forced to work more than eight hours per day, which is the working time provided by law.

S. C. Van Norman has resigned his position as sales agent of the Pittsburgh-Westmoreland Coal Co. at Buffalo. He has been with the company in this territory for four years. No successor has been appointed, but the office will be conducted for the present by B. F. Mills, who is with the company at Cleveland.

OBITUARY

Col. Eugene Zimmerman, of Cincinnati, O., former president of the Cincinnati, Hamilton & Dayton R.R. Co., and widely known as a financier, railroad magnate and capitalist, died suddenly in Cincinnati on Dec. 20, at a club where he was staying. Death was due to a hemorrhage brought on by undue exertion during an illness. Col. Zimmerman was born in Vicksburg, Miss., in 1845, and was a veteran of the Civil War, serving in the Union navy and reaching the rank of commander. After the war he engaged in railroad construction, and was subsequently interested in many large deals involving railroad properties in the Middle West.

CONSTRUCTION NEWS

Blackey, Ky.—It is announced here that the Rockhouse Realty Co. will make a big coal development on Rockhouse Creek above here, expending thousands of dollars in the work.

Glasport, Penn.—It is stated that extensive improvements costing upward of $100,000, and involving the employment of more than 100 men, are to be made by the Allegheny Byproduct Coke Co., the work to be started about Jan. 15.

Jenkins, Ky.—The Penny Coal Co., starting a new development on the Sandy Valley & Elkhorn R.R., below here, will increase its capital stock the first of the year and will also increase the output. As a result there will be a big increase in the working force.

Baker, Ky.—White L. Moss, M. J. Moss and others, after leasing the K. S. Potter coal land tract near here, will organize the Yount's Fork Coal Co. for early development. The new operation will be on the Yount's Fork Branch of the Lexington & Eastern R.R. White L. Moss will be manager.

Benscreek, Penn.—A structural feat will be attempted by the Hughes Coal Co. during January when an effort will be made to build a steel tipple, one of the largest in this part of the state, in 30 days. The reason for this rush is because the miners, about 200 in number, will be made idle while the work is going on.

Edwardsville, Ill.—The Mt. Olive & Staunton Coal Co. will shortly install one of the largest coal washers in southern Illinois. This plant will cost approximately $70,000, and will have a capacity of 1000 tons per day. It will handle coal from mines as far north as Mt. Olive, making grades ranging from slack to egg sizes.

Whitesburg, Ky.—The Mineral Development Co. general offices, Philadelphia, Penn., is preparing for initial developments above here in Letcher County, to start Jan. 1, although plans are not quite complete. J. L. McCormick, Whitesburg, Ky., will be manager of the new operations. It is said a good sized industrial and mining town is planned.

Holt, Ala.—The second barge which will be used in the barge line to be inaugurated by the Pratt Consolidated Coal Co. has been completed. The third will be finished soon. Mr. G. B. McCormack, president of the company, states that he is negotiating for the purchase of a tow boat to be ready as soon as the completion of lock 17, which will be in two or three weeks.

Greensburg, Penn.—The Export Coal Co., of which J. S. Pates, of Monongahela City, is the president and general manager, will in the early spring begin the operation of coal land directly south of Trafford and Cavittsville and north of the Southern Turnpike between East McKeesport and Irwin. It is anticipated that about 400 first-class American miners will be employed.

Lonaconing, Md.—The Maryland Coal Co., of New York, will improve its Lonaconing plant, developing the Tyson bed in the Georges Creek region. It is stated that this firm will install electrical and improved equipment for an ultimate capacity of 1000 tons of coal per day, and upon the completion of this work will probably develop about 1000 acres of fireclay property at Mt. Savage, Md.

Whitesburg, Ky. — Louisville & Nashville engineers are rapidly locating a 10-mile branch of the Lexington & Eastern R.R. from Blackey, in the southern end of Letcher County, up Rockhouse Creek into rich coal and timber fields. The Mineral Fuel Co., the Swift Coal & Timber Co., the Rockhouse Realty Co. and others own large boundaries on Rockhouse and it is expected that developments aggregating millions of dollars will be started in the near future.

Columbus, Ohio—With the passage of an act by the National Congress authorizing the building of a bridge across the Ohio River at Sciotoville by the Chesapeake & Ohio Northern R.R. Co., all obstacles in the way of building the line from Portsmouth to Columbus have been removed. The line in question will be 97 miles long and will shorten the route from the Virginias to the lakes by 102 miles. It is the intention to construct the road at once. The Kentucky terminus of the bridge will be at Limeville, 8 miles above South Portsmouth.

NEW INCORPORATIONS

Richmond, Va.—It has been announced that the West Virginia Coal Co. has taken over the Atlantic States Coal & Coke Co. The principal offices will be in this city, while the Western business of the latter company will be handled at the Cincinnati office of the West Virginia firm.

Morgantown, W. Va.—A charter was recently granted to the Wilfong Coal & Coke Co. This firm has an authorized capital of $10,000 and will operate in the Grant District of Monongahela County. The incorporators are John, L. C., and Edward Wilfong, of Fairmount, and W. L. Boughner and Thomas Ray Dille, of Morgantown.

INDUSTRIAL NEWS

Columbus, Ohio—A meeting of the executive board of the Michigan-Ohio-Indiana Coal Association will be held some time in January, the place and date to be announced later. At that time the matter of fixing a place for the 1915 convention of the organization, to be held in June, will come up for discussion.

Jackson, Ohio—Because of the fact that 18 locomotives used by the Detroit, Toledo & Ironton R.R. leased from the New York Central, the Pennsylvania and the Norfolk and Western have been recalled by their owners, the coal traffic on that line is demoralized. This is especially true of the yards at Jackson.

Wheeling, W. Va.—Following the lead of the Lorain Coal & Dock Co. which boarded up the entrance of its mine at Blaine, Ohio, a short time ago, a number of other big operating companies in the eastern Ohio fields are said to be making preparations to close up their workings. A number of these firms have already sent away their livestock.

LaFollette, Tenn.—The coal land lease secured three months ago by C. H. Thompson, of Darbyville, Va., and W. J. von Borries, of Louisville, Ky., from the Haley Coal Co., on First Creek in Perry County Ky., has been surrendered to the lessors on account of the inability of the lessees to finance the proposition as stipulated when the lease was taken.

Harrisburg, Penn.—The auditor's general department recently mailed 150 blanks to anthracite coal producers, corporate, partnership and individual, upon which to make reports on their tonnage for 1914 for the purpose of levying the state tax on anthracite. The question of constitutionality of the law is now in the hands of Dauphin County Court for determination.

Pittsburgh, Penn.—Although the stage of the river was falling somewhat, two million bushels of coal which had accumulated in the local harbor since the suspension of navigation in June were sent south Dec. 23. Five of the largest tow boats of the Monongahela River Consolidated Coal & Coke Co. were assigned to take out this cargo, the river was then clear of ice.

Washington, D. C.—Increases in the freight rates on coal and coke in carload lots from mines in Alabama, Kentucky, Tennessee, Virginia and Illinois, to Memphis, Tennessee, New Orleans, Louisiana and destinations in other states were recently suspended by the Interstate Commerce Commission until Apr. 30 next. The increases average 15c. per ton on coal, and from 10c. to 50c. a ton on coke.

Beaver, Penn.—Two coal boats, part of the tow of the steamer "W. K. Fields" which left Pittsburgh with a fleet for southern waters a few days ago, broke in two above Industry recently and sank. The boats contained 40,000 bushels of coal. They grounded on the Wolf Run bar, and broke in two after being released. They were owned by the Monongahela River Consolidated Coal & Coke Co.

Fayetteville, W. Va.—The New River Co. during the fiscal year ended June 30, 1914, produced nearly one and one-half million tons of coal, the actual figures being as follows: Beckley mine, 92,927 tons; Collins, 114,820; Cranberry, 180,419; Dunn Loop, 192,040; Harvey, 161,153; Mabscott, 95,647; MacDonald, 59,618; Prudence, 136,262; Stuart, 114,933; White Oak Fuel, 347,435, making a total of 1,485,254 tons.

Louisville, Ky.—Ice in the Ohio River has been seriously interfering with shipments of Pittsburgh coal by the Monongahela Consolidated Coal & Coke Co. This ice has been disgorged into the Ohio from the Monongahela River and has been of sufficient thickness to make shipments inadvisable. Large cargoes of coal, however, were sent ahead of the ice and conditions have since improved so that shipping can be resumed.

Winchester, Ky.—Both the Louisville & Nashville and the Baltimore & Ohio railroads are making extensive preparations to handle the 80 million tons of coal which it is reported the Consolidation Coal Corporation has contracted to deliver in the next six months. It is stated that every one of the company's mines will be put in operation and that deliveries, presumably to one of the belligerent European powers, will be begun at once.

Washington, D. C.—Regulations governing the coal mines on Indian land were recently promoted by Secretary Lane with the object of decreasing fatalities among miners. On and after Jan. 1, 1915, such mines will be required to use either permissible explosives or electric firing systems operated from outside the mine. Provision is made for extension of time in compliance with this order, where a hardship would be worked upon the mine owners.

Washington, D. C.—Officials of the Department of Justice were apparently not greatly surprised when they heard of the dismissal of the Lehigh Valley R.R. case by Judge Hough in the District Court. An appeal will be taken from this decision, and an effort made to have the case brought before the Supreme Court during this term. The necessity of preparing a brief of the record of the case, however, may consume a considerable length of time.

Erie, Penn.—The Erie Pump & Engine Works recently consolidated with the Northern Equipment Co., and the name of the combination will be the Erie Pump & Equipment Co. This firm will occupy the property of the Erie Pump & Engine Works, and John H. Dougherty who, for a number of years, has been in the employ of the Jeamsville Iron Works as designer of centrifugal pumps, has been engaged to take charge of the designing of pumps for the company.

Reading, Penn.—It has been learned that since the reduction of freight rates which has been ordered between the mines and Philadelphia, a movement will be inaugurated all along the Reading railway system to secure a similar reduction in rates on hard coal on the ground that the reduction granted to Philadelphia is discriminatory. It is the belief that the matter will be presented to the proper state authorities soon after the first of the year.

Huntington, W. Va.—As a result of the recent cold weather, the coal business on the Chesapeake & Ohio R.R. has increased and traffic is now much congested. Despite this rush, however, the amount of coal loaded so far this month is not as great as that loaded during the same period of last year. Between Hinton and Newport News terminals are congested with coal cars, thousands of which are standing on side tracks rendering it difficult to handle other classes of traffic with dispatch.

Cincinnati, Ohio—The court of appeals for this district has affirmed the judgment rendered some time ago in the amount of $26,650, in favor of the Campbell Creek Coal & Coke Co. against the Cincinnati Gas, Coke & Mining Co., now the Reliance Coal & Coke Co. The suit was brought on a contract made in 1907, by which the defendant agreed to take 225 barge loads of coal from the Campbell Creek company, the suit being brought on an alleged breach of the contract in 1908. The amount asked was $55,643.06.

San Francisco, Calif.—Word has been received from San Antonio, Argentina, by Hind Rolph & Co., to the effect that the four-masted bark "Drummuir," flying the British flag was sunk by the German cruiser "Leipsic" a few days before the latter was destroyed with the German fleet off the Falkland Islands. The "Drummuir" owned by this firm left Swansea some time ago, and would have arrived here in February had she not been intercepted by the German ship. She was loaded with 2780 tons of anthracite coal.

New York, N. Y.—The Gifford-Wood Co. will shortly establish a branch office in the Hudson Terminal Building, 30 Church St., occupying suite of rooms No. 1038. This office will be managed by A. W. Berghoefer, who will have associated with him Joseph A. Boucher, both being engineers of ability. The territory of this office will include Westchester County, N. Y., the whole of New Jersey, the southern part of Connecticut, and the southeastern part of Pennsylvania; also the Southern States east of the Blue Ridge Mountains.

Denver, Colo.—According to the preliminary draft of the annual report of the state coal mine inspector, James Dalrymple, there has been a decrease of 1,183,577 tons in the amount of coal mined in Colorado during 1914 compared with that produced in 1913. It is estimated that a total of 8,085,362 tons were mined during 1914 as against 9,286,939 tons produced in 1913. The strike, European and Mexican wars, and the closing down of large steel mills in Pueblo, together with a general business depression, are some of the causes for this decrease.

Philadelphia, Penn.—In order to conserve the assets of the Colonial Coke Co., which owes Irish Bros. $96,570 for money loaned, the receivers of the latter firm recently brought action in Common Pleas Court No. 1 to appoint a receiver for the former company. In addition to the amount owed Irish Bros., the Colonial company owes to its employees $2358.45, while the Cambria County Coal Co., lessor of the mine held by the Colonial company, have a claim for $11,236. The assets consist of a lease on coal lands in Cambria County, and mining appliances valued at $20,000.

Harrisburg, Penn.—It is stated that recommendations for embracing under the authority of the state Department of Mines, all quarries, iron ore, and other mines, oil and gas wells and other operations will be made to the next legislature in a report which will be drafted under the authority of a legislative resolution passed in 1913. This measure directed the state chief of mines to make an inquiry into the subject, and it is probable that recommendations will be made that these mines and wells be brought within the scope of a special act, and that regulatory legislation be enacted.

Columbus, Ohio—The New York Central Lines have followed the example of the Baltimore & Ohio R.R. Co. in issuing new reweighing rules which are better suited to the interests of coal shippers and retailers. The new rules are about the same as issued by the Baltimore & Ohio and provide for reweighing upon the request of the consignee at the nearest scales to destination, the cost to be $3 in case the shrinkage is less than 1000 lb. In case the shrinkage is more than 1000 lb. the cost of reweighing is to be paid by the railroad company. The cost of reweighing at the point of destination is only $1.

Birmingham, Ala.—After a long delay on account of lack of funds, the 1913 annual report of Chief Mine Inspector Nesbitt has been issued. This report contains a directory of the mines in Alabama, the seams of coal, number and kind of openings, whether drift, slope or shaft, number of employees, mode of ventilation of each opening, production of each mine, number of days worked, price paid per ton for mining, states whether machine or pick mined, and the railroad connections. The number of coke ovens are listed, together with the output of coke, as well as a description of each mine, and much valuable information regarding accidents, etc.

Philadelphia, Penn.—The State Railroad Commission of Pennsylvania issued its formal order Dec. 28, covering the reduction which was made in the rates of freight to Philadelphia. This becomes effective, Jan. 12, and the various railroads have been requested to furnish the commission with revised tariffs. Officers of the various railroads still maintain silence as to their attitude in the premises, but it is not expected that the rates will be actually established, without some protest on their part in the courts. The decision will undoubtedly be fought to the bitter end. It is expected that there will be virtually no change this winter in the prices of coal at retail, and even if the new rates should be upheld, it is doubtful if the consumer would receive the full benefit thereof.

Columbus, Ohio—A peculiar situation has arisen in Columbus over the administration of the Ohio Workmen's compensation law, which affects every coal dealer in the state. It has been the custom among dealers to furnish a man to wheel coal from the sidewalk to the basement or other storage place. These men are paid by the customer and are not in any sense working for the dealer. Recently a man so employed injured a finger and immediately brought complaint against the dealer, who was not a contributor to the board of awards and thus had to assume the risk individually. It required the employment of an attorney and the taking of depositions to convince the state board of awards that the man was employed by the consumer and not by the dealer. Secretary B. F. Nigh, of the Michigan-Ohio-Indiana Coal Association, advises that all dealers who furnish such a man should impress it upon the workman, as well as the customer, that he is not employed by the dealer.

Montgomery, Ala.—The State Railroad Commission has just reached its decision regarding the proposed rates petitioned for by the railroads out of Birmingham, as follows: The Commission issued orders requiring the railroads to withdraw all special rates not open to the public, except those to pig-iron furnaces and steel plants; denied petitions of Montgomery, Dothan and Alexander City for reductions in coal rates from Birmingham, and adopted Southern Classification No. 40 of the Interstate Commerce Commission which puts intrastate rates in Alabama on a uniform basis with interstate rates. Withdrew its interdiction for a lower rate on coal from Birmingham to Selma; denied petitions of railroads for an increase in rates on coal from mines to Birmingham. In the commodity cases the railroads asked for increases ranging from 10 to 25%, and in granting a 10% increase the Railroad Commission stipulated that it was to meet present conditions only, and would not be effective after June 30, 1915. On rehearing the Selma coal-rate case the Commission decided to reëstablish the original rate of $1 per ton. A rate of 80c. per ton had formerly been established by the Commission, based on the rate to Decatur being 75c. Investigation showed, however, that the Decatur rate was allowed on account of being a highly competitive point with other districts. Permission was granted to the Louisville & Nashville R.R. to withdraw certain building material rates to coal and ore mines and coke ovens. This still leaves the Interstate Commission decision as far as it pertains to shipments to other states, and the operators are anxiously waiting the decision.

Coal Trade Reviews

General Review

Colder weather forces the large anthracite companies to draw on their storage piles. Bituminous trade continues heavy, with sales agents pushing hard to place the current production. Substantial improvement noted in the Middle West.

The long continued cold snaps have created an active situation in the retail anthracite trade, but the wholesale business is still holding back. Supplies are plentiful, though the large companies have been drawing on their stocks. Delays occasioned by freezing coal caused temporary anxiety in some quarters, but on the other hand the dealers reduced their buying over the closing days of the year and there has been no shortage of consequence at any time.

Large stocks, weak prices and excessive surpluses in all directions mark the opening of the new year in the Eastern bituminous trade. The colder weather, which has started coal moving in certain restricted channels, and more or less indefinite reports of a turn for the better in industrial circles after the first of the year, are the only encouraging features in the situation. The surpluses at the main distributing centers are probably a shade less than for some time, and quotations on prompt sales a trifle steadier, but the demand is only spasmodic while only the thinnest pretense is made of maintaining the circulars and sales agents are pushing hard to place the January and February tonnage. On contracts for the new year, the producing interests are holding out determinately for the same prices as last year, and most of the business coming up so far has been closed at these figures, though very slight concessions are occasionally noted.

In the Pittsburgh district, a scarcely perceptible improvement in the demand is noted, due entirely to the additional tonnages required because of the colder weather. As a result the market on free coal is a trifle steadier, and there are encouraging reports of increased working schedules to become effective at many of the mills this month. At the moment, business is confined entirely to routine orders on regular contracts, and spot coal is the only size in which buyers are displaying any interest. The severe cold weather caught the dealers in Ohio with unexpectedly low stocks with a result that there has been a rush of orders, with some of an urgent character. A better sentiment is also noted among the steam consumers, who are now placing orders with every apparent confidence.

In the Southern market current prices continue below the regular circular, but the cold weather and storms have created a demand for immediate shipment; the holiday curtailment and better feelings prevailing regarding the industrial outlook have caused a moderately improved tone in the situation.

The severe cold weather has toned up the Middle Western situation in an impressive manner. Prices are notably stiffer, while mine operations are apparently up to full rated capacity with the coal being absorbed as rapidly as it is mined. The predominating feature in the situation is the heavy demand for steam coal from Chicago which is apparently being met with some difficulty. Higher prices are to be expected most any time from now on.

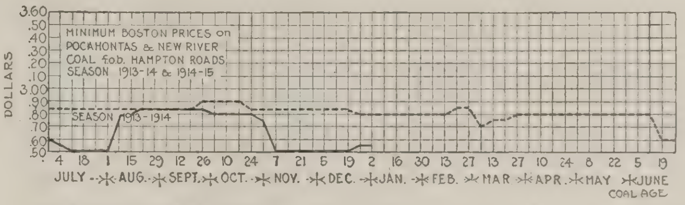
ATLANTIC SEABOARD

BOSTON

Year opens with a surplus of coal at all points. Contract demand slack and Pocahontas and New River interests pushing hard for business. Pennsylvania grades dull with occasional forced concessions. Anthracite in better demand.

Bituminous—There is no improvement in the Pocahontas and New River situation beyond what was reported a week ago. The year opens with dubious legacies from 1914—large stocks, weak prices, a surplus of coal at every loading port, and an industrial situation that is decidedly unsatisfactory. Contract demand is still very slack and there is nothing more to the spot market than has been the case for the past three or four months. The agencies are actively canvassing for business and strong efforts are made to place the January and February output. On such business there is apparently no thought of netting $2.85 f.o.b.; it is a question of getting the orders and making the price satisfactory to the buyer. There is less coal on the market at the various distributing points than for several weeks and prices on cars here are a shade firmer, but there is a lack of snap, to the trade in general.

Nothing is reported so far of the attitude Southern shippers are to take toward yearly contracts. With a certain amount of tonnage already closed at around $2.70 f.o.b. for delivery through 1915 the operators will have to have the situation more firmly in hand than they have at present to secure a gross price anything like $2.85 at Hampton Roads. If it turns out that this price can be firmly held as the contract basis it may be predicted with confidence that certain of the quality grades from Pennsylvania will be actively in the field for what tonnage can be had.



The shippers of Georges Creek are beginning to make good their arrears on shipments, the shortage being made up through the use of anthracite barges from Philadelphia temporarily diverted to the bituminous trade.

There is practically no change in prices on the Pennsylvania grades. The demand is only spasmodic and the market still much restricted. Occasional concessions are made to move distress coal at the shipping ports, but for the most part coal is coming down only on firm orders.

Anthracite—The low temperature of the past fortnight has given an impetus to retail trade and the shipping companies in consequence have more orders in hand. January is looked to for a moderate hard coal tonnage in New England.

Current quotations on bituminous at wholesale are about as follows:

	Clearfields	Cambrias Somersets	Georges Creek	Pocahontas New River
Mines*..........	$0.90@1.50	$1.15@1 .65	$1.67@1.77	
Philadelphia*.....	2.15@2.75	2.40@2 .90	2.92@3.02	
New York*.......	2.45@3.00	2.70@3 .20	3.22@3.32	
Baltimore*......	....	....	2.85@2.95	
Hampton Roads*.	....	....	....	$2.55@2.75
Boston†.........	....	....	....	3.63@3.78
Providence†.....	....	....	....	3.48@3.73

* F.o.b. †On cars.

NEW YORK

Bituminous mines are working more steadily. Situation more hopeful but prices still unchanged. Anthracite buying slowed down over the year-end in spite of the cold weather.

Bituminous—The demand for bituminous coal has improved, due to the long-continued cold weather. But it has not improved to an extent that would warrant any increase in prices, and coal is still selling at or about the cost of production; however, this is a distinct improvement and there is a still better feeling as to the future.

Mines are working more steadily; those on three-day schedules are now working nearer five, and there are others that are on full time. On the other hand those producing the poorest grades have not yet started up or at least are doing little, if anything. It is possible that present conditions will still improve; at least it is not expected that they will be less favorable. There will, from now until April, be a natural restriction on account of the large number of holidays, which are usually celebrated by all classes and nationalities. There is also likelihood of a shortage of railroad cars. There has already been a shortage on one of the roads due rather to a lack of motive power causing a delay in movement, but the general effect is the same as mines are unable to work steadily. Labor is still plentiful, but there is a feeling that this will only continue until the steel works resume full time when the mines will encounter a shortage.

A little contracting has already been done, and last year's prices have ruled in most instances. Only slight concessions have been made, as operators feel the absolute necessity of securing these prices. The situation appears more hopeful to most concerns. Prices continue unchanged as follows: West Virginia steam, $2.35@2.55; fair grades, Pennsylvania, $2.55@2.65; good grades of Pennsylvania, $2.70@2.80; best Miller Pennsylvania, $3.10@3.15; Georges Creek, $3.15@3.25.

Anthracite—There has been a decided improvement in the hard-coal trade during the past week, and dealers are all very busy. They have all ordered new supplies and the docks are having all they can do to load the required cargoes because the coal is badly frozen and the capacity of the piers is reduced about one-half.

Broken coal is made only in sufficient quantities to take care of contract business, and there is little to be said about any special market condition. Egg is plentiful; in fact, it is troublesome and is being offered as low as the April circular. Stove is very active and is being taken from storage in large quantities; there is no premium or cut in circular prices. Chestnut is strong and shipments in the line trade slow. There is sufficient in storage to take care of an active demand at tide, and large quantities are being picked up.

Pea is very scarce, but no premiums are being paid. Buckwheat is short in the better grades and prices are firm; there is sufficient of the cheaper qualities but prices have firmed up materially from recent low figures. Rice and barley are short in all grades and are holding firm.

The market is quotable on the following basis:

	Upper Ports		Lower Ports	
	Circular	Individual	Circular	Individual
Broken	$5.10	$4.60@5.10	$5.05	$4.55@5.05
Egg	5.35	5.00@5.35	5.30	4.80@5.30
Stove	5.35	5.25@5.35	5.30	5.20@5.30
Chestnut	5.60	5.45@5.60	5.55	5.40@5.55
Pea	3.55	3.45@3.55	3.50	3.35@3.50
Buckwheat	2.80	2.50@2.80	2.50@2.75	2.15@2.75
Rice	2.30	2.20@2.30	2.00@2.25	1.35@2.25
Barley	1.80	1.60@1.80	1.75	1.25@1.75

BALTIMORE

The coldest December weather in history of local weather bureau booms consumption of fuel. Much difficulty with frozen coal. Not much improvement in soft-coal situation at mines.

The colder weather has forced a number of the smaller consumers to get in more coal, and domestic sizes of anthracite are in healthy demand. Ice-covered streets caused considerable trouble with wagon deliveries, and the motor truck again demonstrated its superiority in such conditions. Falls of snow throughout a large part of this and neighboring states sent much of the fuel to this city in a badly frozen condition and the usual troubles with thawing resulted. This is particularly true of the smaller dealer who has not the facilities for direct dumping in many cases.

The holidays brought a nearly complete shut-down in many mining districts, but unlike previous years, it was not wholly unwelcome. Gas coals of West Virginia are sluggish, three-quarter being offered at 85c. and run-of-mine around 75c. Steam coals run from 85 to 90c. at the mines. Pennsylvania coals of better quality are probably the best feature here, as the local demand, outside of that for export fuel, is for the better grade Pennsylvania products. From medium to best they are bringing from $1.15@1.35.

The export trade is not rushing as some had hoped. Isolated charters are announced from time to time, but there is not the same busy aspect to the piers that characterized September and October loading. The bunker trade holds up exceptionally well, however, under an immense grain movement.

BUFFALO

There is the customary light movement during the holidays. Much expectation of improvement after Jan. 1. Slack continues to advance. Cold weather helps anthracite.

Bituminous—Business now is confined to routine orders on regular contracts, which must be filled anyhow. Some of the larger shippers expect a decided turn for the better after the new year is well under way, but others refuse to hold out hopes as yet.

Slack coal is still strong. It has been scarce for some time and there is no improvement in the supply, so a slight increase in the demand will insure a good trade. There are low-price mine agents here, which indicates that they are not able to sell their coal near home and are willing to bring it here for almost anything the consumer will offer. An increase in consumption would scarcely drive them off the market.

At the same time there is hope of a limited revival in demand that will give the miners work and stop the complaints of despondent jobbers. The general belief is that there will be a better outlook in the next 30 days. The Canadian trade is improving slowly; England is calling on the Dominion for all sorts of manufactures and many idle factories are starting up.

The slight strengthening of the market does not yet warrant any change in quotations which remain on the basis of $2.80 for Pittsburgh lump, $2.70 for three-quarter, $2.55 for mine-run and $2.15 for slack. Allegheny Valley prices are 25c. lower than Pittsburgh.

Anthracite—The demand is not heavy, but has increased since the weather turned colder. About the usual amount has been sold for the year and with the exception of a surplus of egg coal, the trade is in a normal condition. Some shippers say that the cold weather has not helped their rail-line trade to any extent. An effort is being made to load considerable anthracite into vessels before the ice in the harbor becomes heavy, but with this weather the Lake is fast closing and it will be difficult to navigate the inner harbor soon, though the presence of a large amount of grain to be unloaded this winter makes it necessary to keep the channels open. Nobody remembers a previous December when the harbor and Lake were so blocked by ice.

A winter, such as this promises to be, will clean up the Upper-Lake docks and make business Westward brisk in the spring. There is a good demand for independent anthracite, considerably more of it being sold in this market than formerly. Prices are on a par with the regular circular.

PHILADELPHIA

Anthracite situation shows little or no improvement over last week. Seasonable weather stimulates retail trade, but has not as yet been reflected in the wholesale market. All sizes in good supply. Bituminous slightly improved.

Anthracite—The past week was all that could be desired from a coal-burning standpoint, but nevertheless it failed to help the market as much as was anticipated, particularly in the wholesale trade. Business is fairly brisk, but dealers all have good stocks, and there is no difficulty at all in securing prompt shipments. Even stove size is in easy supply. The demand at the present time seems to be centered on chestnut, pea and buckwheat sizes, and with the curtailed work at the mines, owing to the holidays, some of the companies have drawn on their stocks to meet the current demand. Broken and egg still continue in a rut, and very low prices are being quoted by the individuals in their efforts to move egg; 50c. off circular on consignments to rail points nets the operator a fairly good return, and considerable business is being done on this basis. The demand for broken is in marked contrast to what it was a year ago; at that time many operators were turning down business for this size, but such is not the case now. The price of this coal has advanced considerably during the last three or four years and quite a number of large contracts that formerly fell to the large companies are now taken care of by the individuals.

Prices at tidewater rule about as follows:

	Circular	Individuals
Broken	$4.75	$4.50
Egg	5.00	4.75@4.85
Stove	5.00	5.00
Chestnut	5.25	5.25

Bituminous—This is the contract season of the year for both anthracite and bituminous, and the latter seems to show slight indications of an improvement, but it is so gradual that it is almost impossible to record the changes that have taken place from one week to another, though there is undoubtedly a better disposition in the trade. Prices have not perceptibly advanced, but there appears to be a stronger demand.

OCEAN FREIGHTS

Chartering light but demand even more urgent and rates still advancing.

The freight market is even higher than a week ago. Although the demand for steamers for grain, cotton, general cargo, etc., is as urgent as heretofore, even at advanced rates, the number of charters has diminished, owing to the scarcity of tonnage and the Christmas holidays. It is difficult to interest owners in export coal, and it is almost impossible to secure cable refusals, but with export coal orders firm in hand, we are occasionally able to close charters and contracts.

To	Rate	To	Rate

HAMPTON ROADS

Shipments light and prices unchanged. Rates made for 1915 bunker contracts.

There have been a few large coastwise shipments as well as some movement foreign, but neither of these has been as heavy as might have been expected at this season of the year. The Christmas holidays have also interfered to some extent with the dumpings.

The demand for both coastwise and export shipments is still light and the greater part of the movement confined to contracts. Prices for prompt shipment remain unchanged. Bunker rates for supplying coal under contract during 1915 have been fixed at $3.30 plus trimming, and is somewhat of a change from the prices for the last two years.

Cold weather has caused the demand from retail dealers to increase somewhat although to no great extent. The call for New River and Pocahontas nut for domestic coal seems to be gradually improving, and so far as can be ascertained it is giving entire satisfaction.

OCEAN CHARTERS

Coal charters have been reported by the "Journal of Commerce" as follows:

Vessel	Nationality	From	To	Tons	Rate
Egda	Norwegian	Baltimore	Colon	1610	
Marie O. Teal		Philadelphia	Porto Rico	682	
Evelyn W. Hinkly		Philadelphia	Galveston	558	$1.10

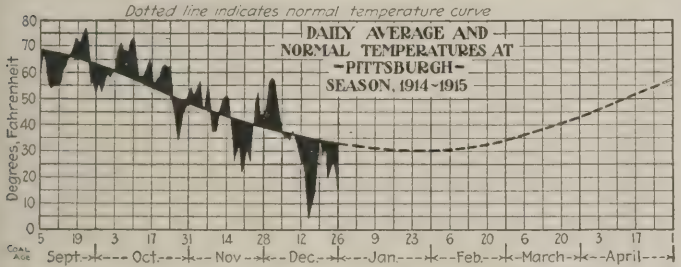
Note—Steamers are indicated by **bold face** type, all others being schooners.

OHIO VALLEY

PITTSBURGH

Increased demand for coal due to cold weather, and prospective further increase in manufacturing operations. Production about 50% of capacity against 40% formerly, and prices slightly steadier.

There is a slightly improved demand for coal nearly all along the line. The retail demand has been good for three weeks, and as the weather continues seasonably cold there is no prospect of its abating. The demand from railroads, power and manufacturing plants generally has proved decidedly better in the past fortnight, and the improvement is attributed by producers not to increased operation but to the greater amount of coal required to produce results in cold weather. A further increase in demand is also expected as reports are that the steel mills are going to run at a considerably fuller rate in January than in December. To some manufacturing consumers there has been a temporary curtailment in shipments, as a stoppage was ordered from the day before Christmas to the following Monday.



The Pittsburgh coal district as a whole is now operating at about 50% of capacity, as against not over 40% a fortnight ago. The market for free coal is a trifle steadier, though there is still some shading from $1.15 for mine-run, but on the other hand some good grades cannot be secured at that figure. The slack market has firmed up further and it is now on the regular basis of 90c., with some operators quoting $1. The market is quotable approximately as follows: Slack, 90c.; nut and slack, $1; nut, $1.10; mine-run, $1.15; ¾-in., $1.25; 1¼-in., $1.35, per net ton at mine, Pittsburgh district. These are prompt prices. There are no circular prices out. Some time ago one or two operators put out a circular based on $1.20 for mine-run, but this was not adopted generally. The Pittsburgh Coal Co. has issued no circular prices and nominally its circular prices are the old ones based on $1.30 for mine-run. This interest will name new circular prices about Apr. 1, when a number of current contracts expire.

COLUMBUS

The continued cold weather has stimulated trade. Prices are steadier and the volume of business larger. Better times anticipated after the first of the year.

Zero weather has had a beneficial effect on the coal trade. Prices have stiffened materially and the volume of business is increasing while a better tone is noted on all sides.

Domestic business was stimulated to the greatest extent by the more favorable weather. Dealers' orders are coming in better all along the line and one of the best features is the request for immediate shipment. The retailers' stocks are only fair and the colder weather has made it necessary for them to cover promptly.

The steam trade is still slow but a slight improvement was reported during the week. Manufacturing seems to be increasing and the colder weather makes the fuel consumption larger; railroads, for instance, require an increased tonnage for handling their trains. The small sizes are still strong but this condition is not expected to continue with the increased production of lump. Nut, pea and slack are selling around 70c. and coarse slack is only 10c. less. Steam plants which use slack exclusively have had difficulty in getting their requisitions filled.

Production during the past week has shown a substantial gain; although a holiday intervened and Saturday was a day of idleness the output compares very favorably with previous weeks. In the Jackson field the production is now about 70% of normal and the same prevails in Crooksville and Cambridge.

Prices in the Ohio field are:

	Hocking Valley	Pomeroy	Kanawha
Rescreened lump	$1.55	$1.65	.....
Inch and a quarter	1.50	1.55	$1.40
Three-quarter inch	1.35	1.40	1.35
Nut	1.15	1.25	1.15
Mine-run	1.10	1.15	1.10
Nut, pea and slack	0.70	0.25	0.65
Coarse slack	0.60	0.65	0.55

CINCINNATI

Continued cold weather and improvement in manufacturing circles have stimulated the market on all sides. Indications are that activity has begun and will continue, with much better prices.

A steadily increasing activity in all branches of the coal trade has developed an improved domestic demand and an unexpectedly heavy call for steam coal. The light buying of the past two or three months has given way to something like an urgent demand, due probably to the fact that stocks are low. The first week or so of severe weather depleted the surplus stocks rapidly, leaving the dealers with an inadequate supply for their trade. A rush of orders, especially for immediate delivery, naturally resulted.

The most encouraging factor, however, is the improvement in the steam demand. Large consumers seem to have made up their minds that the business depression is over, and are placing their orders with apparent confidence. The increasing demand for slack for coking purposes is also having a strong effect on this grade.

CLEVELAND

The coal market is holding up well in spite of the holidays. Receipts are light, but the demand is fair. Surpluses being cleaned up.

Manufacturing plants running full time the last few weeks have not closed down over the holidays as is often done, and most of those working part time will put in a few days during the holidays. This has kept the demand for steam coal well up to the production. A little warmer weather has taken the edge off the retail demand, but it is still cold enough to keep the business moving.

Only 300 cars of coal arrived here Monday. The mines worked up to Friday, but did nothing more until Monday. This will reduce the movement the rest of the week and by New Years the market will be clean. Receipts this week have been put in on contracts, and jobbers and operators did not try to place coal with outside trade.

There has been very little change in the spot price for mine-run and three-quarter coals and slack is holding up to $1.75. The coal that is coming here is being moved on contract, as shipment prices are higher than spot quotations. Jobbers paid $1.72½ for fine coal at the opening of the week and sold it at $1.75 to regular customers. This was spot business.

The domestic market is stronger and prices are firm on high-grade coals. Pocahontas, which was low a week ago, is stronger and cannot be bought below shipment prices.

For shipment the prices are as follows:

	Pocahontas	Youghiogheny	Bergholz	Fairmount	W. Va. No. 8
Lump	$3.60	......	......	......	......
Lump, 6 in.	......	......	$2.45	......	......
Egg	3.60	......	......	......	......
Egg, 6 in.	......	......	2.10	......	......
Lump, 1¼ in.	......	$2.45	2.25	......	......
Lump, ¾ in.	......	2.30	2.10	$1.95@2.00	$2.00
Mine run	2.65	2.25	1.95	1.85@1.90	1.90
Slack	2.40	1.80@1.85	1.75	1.85	1.80

COKE

CONNELLSVILLE

Furnace coke contracting movement concluded, with only two or three deals hanging over. Few sellers participated, others awaiting higher prices later. Production slightly increased while shipments decrease 12,000 tons.

The furnace-coke contracting movement is now over for the present. Two or three contracts are hanging, the prospective consumers desiring to wait until the end of the month before closing finally, in order to have an opportunity to test the coke involved, which is now being shipped on a temporary arrangement. The feature of the movement just ended is that almost all the coke was sold by three interests, Washington Coal & Coke Co., W. J. Rainey and J. H. Hillman & Sons Co. The Producers Coke Co., of Uniontown, has sold some coke, but no large proportion of the capacity for which it acts as sales agent. Thse who did not sell coke are expecting to obtain much better prices later, when fresh demand arises, as the furnaces now idle have not contracted. We quote: Prompt furnace, $1.60; contract furnace, $1.75; prompt foundry, $2@2.20; contract foundry (nominal), $2.35@2.50 per net ton at ovens.

The "Courier" reports production in the Connellsville and lower Connellsville region in the week ended Dec. 19 at 198,533 tons, an increase of 2258 tons, and shipments at 188,049 tons, a decrease of 12,009 tons.

BUFFALO

When the iron trade is making good progress there will be a better report possible of coke, but for the present the demand for both is not what it should be. The Buffalo customhouse report of iron-ore receipts shows 2,882,030 tons by Lake for the season of 1914 and 5,208,930 tons for 1913. Furnaces in this district are running faster than they were, but are not really active. Coke prices are $4.25 for best 72-hr. Connellsville foundry and $3.30 for stock coke.

CHICAGO

A better demand has developed for domestic sizes and continued improvement is noted for furnace and foundry coke. Prices are as follows: Byproduct, $4.75@4.95; Connellsville, $4.75@5; Wise County 72-hr. (select), $5; gas coke, $4.25@4.50; furnace coke, $4.50@4.75.

ST. LOUIS

There are several small inquiries out for foundry coke for the first of the year and rumors that large inquiries will be sent out on the first. During the past week two or three small orders were placed for byproduct coke for domestic purposes, to be shipped after the first. Local gas house is in good demand and moving fairly good, with indications that a greater tonnage will move during the month of January than ever before. Retail prices per short ton delivered to consumers are: Local gas house, $5.75; byproduct, $6.25@6.50.

SOUTHERN

BIRMINGHAM

Lump coal shows some improvement but steam grades continue quiet.

The past ten days have been very cold, with sleet and snow, and as a consequence, lump coal has shown some improvement for immediate shipment, though prices are below the regular schedule and the retail yards are buying only in small quantities. Steam coal does not seem to have improved any, the demand being light and many of the mines will remain closed after the holidays until the demand is better. Blacksmith coal is in a normal condition, and while the demand is not quite what it should be, due to the general business conditions, still the operators seem to have no cause for complaint. Some large sales of pig iron have recently been made, but prices are low.

LOUISVILLE

Reduced operations over the holidays and increased demand as a result of the cold weather have steadied up the market.

Though operations were reduced to a minimum during the holidays, it is expected that work will now be resumed on a more general scale. Conditions seem to be better and there appears to be a more buoyant, confident feeling in all lines of commercial activity.

Prices are up slightly as follows: Block, $1.60 to $1.80; lump, $1.40 to $1.50; straight run-of-mine, $1 to $1.10; four-inch steam lump, 80 to 85c.; six-inch lump, 90 to 95c.; nut and slack, best grades, 60 to 75c., all prices f.o.b. mines.

MIDDLE WESTERN

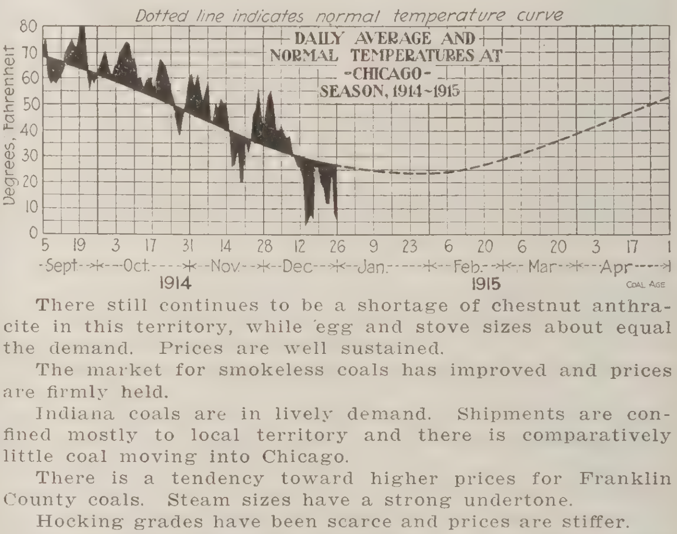
CHICAGO

Continued zero weather gives an impetus to the market. Domestic coals firm. Screenings very strong. Anthracite demand good.

A week of weather averaging near the zero mark has moved up prices generally. The buying of domestic coals from country districts has been very active. Local yard sales have increased in an impressive manner, and there has been a pronounced buying movement on the part of householders, apartment and office buildings.

Steam coals are still advancing under the influence of the increased orders from factories and screenings are averaging 80c., while it is reported some shipments have been sold as high as 95c.

There is no question but that the decision of the Interstate Commerce Commission to allow the 5% rate case will greatly stimulate industrial conditions in this market. The heavier demand has increased operations at all the Illinois and Indiana mines to maximum capacity, and the coal is seemingly absorbed as fast as shipped. In the Indiana field particularly all the mines have been operating every day, and a great many idle miners have been able to return to work.



There still continues to be a shortage of chestnut anthracite in this territory, while egg and stove sizes about equal the demand. Prices are well sustained.

The market for smokeless coals has improved and prices are firmly held.

Indiana coals are in lively demand. Shipments are confined mostly to local territory and there is comparatively little coal moving into Chicago.

There is a tendency toward higher prices for Franklin County coals. Steam sizes have a strong undertone.

Hocking grades have been scarce and prices are stiffer.

The demand for splints has improved, but not much change is noted in quotations.

Springfield domestic coals are in good demand, and screenings are still strong.

The market is steady for Eastern Kentucky coals, and sales have increased.

Prevailing quotations are as follows:

	Franklin Co.	Springfield	Sullivan	Clinton	Carterville
Lump......	$1.50@1.75	$1.50	....	$1.50@1.60	$1.75

No. 2 nut..	1.40@1.60	....	....	....	....
Screenings..	0.80@0.85	....	....	....	....

Green County 5-in. lump, $1.50@1.65; 3-in. lump, $1.30@1.40: 5-in. egg, $1.30@1.40; 3-in. egg, $1.30; mine-run, $1.10.

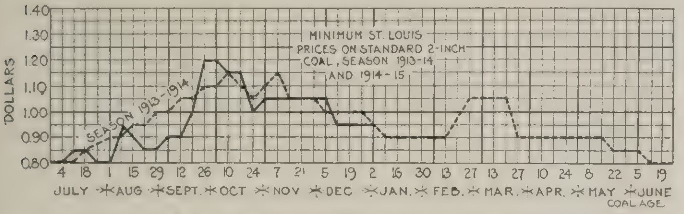
ST. LOUIS

Business satisfactory at the moment and the outlook better than for some time. Prices showing a tendency to advance. Some operators are now well covered.

Moderate winter weather has kept the local market in fairly good shape. It might be better, and could be worse, but in a general way there is little to complain of. Tonnage is usually light during the Christmas holidays, unless there be some extremely cold weather, and this brings to the retailer what is known as charity business.

There is a distinctly optimistic air as regards the future, and unless all signs fail, business conditions will soon be materially improved. There is no complaint as to the tonnage moving in from the higher grade fields of Williamson and Franklin Counties, and the prices are fairly good. During the past week there has been a slight increase in lump and egg, and the washed sizes, and there has been no important decrease in the steam sizes. The local market is not as strong on steam coal as the Chicago market, and several hundred cars have been moved there from St. Louis.

A few operators in Williamson and Franklin Counties are sold up so far that they are now asking $1.75 on lump and egg and No. 1 washed, but this is not general, the top of the market being about $1.60 to $1.65 and the bottom about $1.35 to $1.40.



In the Standard field conditions are normal, 6-in. lump bringing anywhere from $1.20 to $1.30 or $1.35, and 2-in. lump from $1.10 down to 95c. Screenings are still strong at from 55 to 60c., and the Chicago buyers are paying as high as 65c.

The country demand for both high grade and Standard is fairly good, and promises to continue.

No smokeless moving in, and anthracite is slow. Higher prices can be looked for on domestic sizes from now on and there will likely be a weakening on the steam grades.

Market is quotable on the following basis:

	Williamson and Franklin Co.	Big Muddy	Mt. Olive	Standard	Sparta
2-in. lump	....	....	$1.25	$1.00@1.10	$1.10@1.15
3-in. lump	....	....	1.40	....	....
6-in. lump	$1.40@1.65	....	1.50	1.15@1.30	1.20@1.30
Lump and egg	1.85@2.15	$2.25	....	....	1.35
No. 1 nut	1.30@1.40	....	....	0.90@0.95	....
Screenings	0.50@0.55	....	0.80@0.85	0.55@0.65	0.60@0.65
Mine-run	1.00@1.10	....	....	0.85@0.90	....
No. 1 washed nut	1.60@1.75	2.00	1.60	....	....
No. 2 washed nut	1.40@1.50	....	1.45	....	....
No. 3 washed nut	1.15@1.20	....	....	....	....
No. 4 washed nut	1.10@1.15	....	....	....	....
No. 5 washed nut	0.75@0.85	....	....	....	....

The local retail market is quotable on the following basis: Carterville, 14c. per bushel or $3.50 per ton; Mount Olive, 12c. per bushel or $3 per ton; Standard, 11c. per bushel or $2.75 per ton; Smokeless, West Virginia, $6.50 per ton; Pennsylvania anthracite chestnut, $8.50; egg and stove, $8.25; grate, $8; Spadra Arkansas anthracite, all sizes, $7.50 per ton.

SAN FRANCISCO

Colder weather stimulates the trade and dealers are rushed with urgent orders.

The weather has been unusually cold the last week, with heavy rainfall and dealers are rushed with deliveries now, while inquiries are still numerous. Prices continue at $9.50 to $11 for anthracite, while steam coal is wholesaling at $6.50 and domestic at $7.50. Many shipments of coke have arrived during the past few days and several large vessels are now unloading.

KANSAS CITY

The zero weather stimulated the market only a little. Prices still unchanged. Retail business active.

The coal market in Kansas City has not felt the stimulation that the last two weeks of cold weather should have brought. Most of the dealers account for this by the fact that the gas this year has been more plentiful. There has been no change in prices and none is expected before Jan. 15 and possibly not until the first of February. In the meantime the October circulars are being adhered to very closely.

Most of the retailers are doing very well as the streets are moderately free of ice and snow, making deliveries easy, but this has not benefited the wholesaler. The retailers had large supplies on hand, and the operators and wholesalers are selling but very little more than they did before the cold spell set in. Two more weeks of the present weather will be required to set the business going all around. Kansas coal seems to be holding its own very well, especially slack. Illinois coal is steady and selling at $1.75.

PORTLAND, ORE.

Cold weather increases activity in coal business here. Severest weather for almost 20 years.

The Pacific Northwest has had freezing weather for almost three successive weeks, with the thermometer down to 23° most of the time at night. This caused an active demand for coal and if it continues long it will mean a good volume of business soon after the first of the year, as consumers here stock up only sufficient to carry them through a couple of months of cold weather. It is reasonable to presume that January and February and possibly March will bring some cold weather and if so, supplies in the hands of the consumers are going to be low long before the winter months have passed. Prices have shown no advance as yet.

Coal Contracts Pending

Contracts listed in this department are authoritative in every respect except where the source of information is questionable in which event it is noted. All contracts are listed promptly on receipt and only repeated when additional information becomes available or in the last issue previous to the day on which bids will be closed. Liberal remuneration will be paid for all legitimate notices of this kind sent in.

⁂

Contract No. 22—Philadelphia, Penn.—This contract, which provides for furnishing the city with 225,000 tons of anthracite and bituminous coal for next year (pp. 933, 952, 1009, 1048, Vol. 6) has been bid on by 40 different agencies. The results have not yet been announced. Address Director Loeb, Room 225, City Hall, Philadelphia, Penn.

Contract No. 39—Youngstown, Ohio—Press reports state that sealed proposals are requested by the Director of Public Service until Jan. 4, for furnishing and delivering 20,000 tons of coal f.o.b. cars at the City Water Works Pumping Station, Filtration Plant, and City Crematory. A certified check for $2000 must accompany each bid. Address H. C. Fox, Clerk, Department of Public Service, Youngstown, Ohio.

Contract No. 40—Paducah, Ky.—The municipal light plant at this place will contract for 1200 tons of mine-run coal this month, deliveries to be made over the next year. The customary price is $1.85 per ton. Address J. O. Keehler, superintendent of light department, Paducah, Ky.

PRODUCTION AND TRANSPORTATION STATISTICS

PENNSYLVANIA RAILROAD

The following is a statement of shipments over the P. R.R. Co.'s lines east of Pittsburgh and Erie for November and eleven months of 1913 and 1914, in short tons:

	November		Eleven Months	
	1914	1913	1914	1913
Anthracite	1,017,942	987,487	10,223,221	9,699,210
Bituminous	3,667,385	4,509,375	44,013,552	47,171,538
Coke	602,573	999,500	8,926,580	13,011,863
Total	5,287,900	6,496,352	63,163,353	69,882,611

SAULT STE. MARIE CANALS

Coal shiments through the Sault Ste. Marie Canals for December and the season compare as follows:

	December			Season		Decrease	
	Canal			Canal			
	U. S.	Can.	Total	U. S. 1913	Can. 1914	Tons	%

BITUMINOUS COAL MOVEMENT

The following is a summary of the movement of coal and coke over 13 principal railroads during September and the first nine months of the last two years, in short tons:

	September		9 Months	
Anthracite	1913	1914	1913	1914
Baltimore & Ohio[1]	126,919	122,436	1,060,724	991,180
Chesapeake & Ohio[1]	1,006	2,526	12,994	13,163
Erie[2]	749,687	823,037	6,489,298	6,923,458
Pennsylvania[1] [3]	813,394	996,528	7,665,020	8,149,935
Virginian[2] [1]	50	69	859	317
Total 5 roads	1,691,056	1,944,596	15,228,895	16,078,053
Bituminous				
Baltimore & Ohio[1]	3,148,994	3,034,868	27,250,529	24,931,152
Buffalo, Roch. & P.[1] [2]	851,501	707,839	7,052,765	6,047,795

August	19,757,104	18,740,453
September	19,080,318	18,601,926
Total, 9 months	166,664,112	157,775,152

[1] Includes coal received from connecting lines.

[2] Includes company's coal.

[3] Does not include company's coal hauled free.

Note:—The Southern Railway hauled 351,899 short tons of bituminous coal during August, 1914, and 2,616,314 short tons during the seven months ending Aug. 31, 1914.

NORFOLK & WESTERN RY.

The following is a statement of coal handled by the N. & W. Ry. during November and the past four months of last year in short tons:

	August	September	October	November
Pocahontas Field	1,277,621	1,390,531	1,021,699	837,577
Tug River District	293,179	295,332	270,651	253,975
Thacker District	286,572	295,776	264,528	235,080
Kenova District	105,724	110,158	112,455	90,772
Clinch Valley District	134,408	158,393	84,530	237,831
Other N. & W. Territory	4,211	4,781	4,860	3,849
Total N. & W. Fields	2,101,715	2,254,971	1,758,723	1,659,084
Williamson & Pond Creek R.R.	91,813	85,053	70,338	62,505
All other railroads	257,280	169,892	168,778	131,269
Grand total	2,450,808	2,509,916	1,997,839	1,852,858

Destination of shipments over this road for November and the first eleven months of last year and the year before were as follows, in short tons:

	November		Eleven Months	
Coal	1913	1914	1913	1914
Tidewater, foreign	50,154	109,095	1,392,064	1,795,486
Tidewater, coastwise	269,169	288,201	3,474,018	3,508,282
Domestic	1,865,015	1,455,562	18,084,882	18,527,036
Coke				
Tidewater, foreign	16	......	30,507	339
Domestic	120,450	74,468	1,445,944	945,197
Total	2,304,804	1,927,326	24.427,415	24,776,340

SOUTHWESTERN TONNAGE

The following is a comparative statement of the Southwestern tonnage for July and the preceding two months of the years 1913 and 1914:

	May		June		July	
State	1913	1914	1913	1914	1913	1914
Missouri	186,366	165,395	187,723	185,731	198,723	177,093
Kansas	407,124	370,097	412,371	490,561	465,761	513,312
Arkansas	130,020	95,749	145,306	133,350	163,185	117,016
Oklahoma	252,901	241,180	255,481	273,692	272,124	234,648
Totals	976,411	872,421	1,000,881	1,083,334	1,099,793	1,042,069

This statement only covers the tonnage of members of the association, which is estimated to be at least 95% of the entire production.

I. C. C. No. 6653—Schrager Coal Co. vs. Delaware, Lackawanna & Western R.R.

Carload rates on anthracite coal from Schrager's washery, near Taylor, Penn., to tidewater points in New Jersey found unreasonable to the extent they exceed the rates to same points from Taylor. Reparation awarded.

FOREIGN MARKETS

GREAT BRITAIN

Shortage developing and market tense. Export trade continues the same but with vessel tonnage becoming scarcer.

Dec. 18—The London coal trade continues exceedingly brisk. Public prices advanced 24c. on Friday last, and all pit prices are either withdrawn or advanced. Altogether the market is very excited, and the shortage of all qualities by rail and by sea is causing intense difficulties. The depot trade is slow.

The main features of the coal export trade during the past week have not changed, except to become slightly more accentuated. Tonnage, for instance, has been even less plentiful owing to the severe weather. Curiously enough, Cardiff has been an exception, for boats have arrived quite freely. Prices here have strengthened, and the outlook appears much more favorable. The pre-holiday demand is having its effect upon the inland trade markets. Those in Lancashire show an all round improvement, while marked increases in demand are also found throughout Yorkshire and Derbyshire. In both the latter cases wagon scarcity is causing great inconvenience. The Scottish coal trade is again active.—"The Colliery Guardian."

Dec. 18—Business is difficult to arrange owing to congestion. Values all round have a harder tendency and are approximately as follows:

Best Welsh steam	$5.04	Best Monmouthshires	$3.96@4.08
Best seconds	4.32@4.56	Seconds	3.84@3.96
Seconds	4.08@4.20	Best Cardiff smalls	2.88
Best dry coals	4.56	Cargo smalls	1.98@2.22

The prices for Cardiff coals are f.o.b. Cardiff, Penarth or Barry, while those for Monmouthshire descriptions are f.o.b. Newport, both net, exclusive of wharfage and for cash payment.

Freights—Chartering is less active owing to stemming difficulties. Rates are approximately as follows:

Gibraltar	$3.24	Venice, Ancona	$6.84	Singapore	$5.28
Malta	3.48	Alexandria	4.95	Las Palmas	2.64
Marseille	4.20	Port Said	4.98	St. Vincent	3.00
Algiers	3.80	Aden	5.04	Rio Janeiro	3.96
Genoa, Savona	4.32	Colombo	5.04	Monte Video	3.48
Naples	4.38	Sabang	5.04	River Plate	3.72

Exports—British exports for November and the first eleven months of the past three years were as follows:

	November			Eleven Months		
To	1912	1913	1914	1912	1913	1914
Russia	230,544	379,347	1,773	3,859,229	5,598,119	3,087,805
Sweden	421,431	404,540	378,524	3,760,592	4,183,554	3,959,216
Norway	250,621	207,766	177,735	2,005,631	2,096,394	2,282,638

The Boys at the Mines Know the Barsteel

"When John told me a year ago he had decided to buy the *Barsteel* instead of duplicating the old solid box frame, I thought he was making a mistake, *but he knows,* and now I know.

"Not a thing wrong and she pulls more coal all day every day than any other. I can inspect inside and out in a few minutes. The Baldwin-Westinghouse people knew what the miner needed when they designed this locomotive.

"It costs less to run one of these than any other, because
BARSTEEL is the strongest frame obtainable.
Motors don't spark even with overloads.
Bronze armature bearings, with oil and waste packing, never give trouble.
Vauclain Gib makes easy removal of Main Journal.
With the open frame you can oil motors or put on Brake shoes without removing a bolt.

"Every user of the *Barsteel* is a Booster, because it is absolutely the most reliable built. You can obtain full information about it by addressing either Company."

The Baldwin Locomotive Works, Philadelphia, Pa.

Correspondence suitable for the columns of COAL AGE solicited and paid for. Name and address of correspondents must be given—not necessarily for publication. Subscription price $3 per year, in advance, for 52 numbers to any postoffice in the United States or possessions, and Mexico. $4 to Canada. $5 or its equivalent to any other foreign country.

Subscribers in Great Britain, Europe and the British Colonies in the Eastern Hemisphere may send their subscriptions to the London Office, 6 Bouverie St., London, E. C., England. Notice to change address should be written to the New York Office in every instance.

Advertising copy should reach New York Office by Thursday of week prior to date of issue. Entered as second class matter, October 14, 1911, at the Postoffice at New York, New York, under the Act of March 3, 1879.

VOLUME 7 JANUARY 9, 1915 NUMBER 2

CONTENTS

WITH PRINCIPAL ARTICLES SUMMARIZED

*Illustrated Article

FOREWORD: *Page* 41

A review of the coal and coke industries during 1914. The figures of total production are given.

REVIEWS OF COAL MINING FOR 1914: *Pages* 42-58

Reports from mine inspectors and special correspondents in Alabama, Arkansas, Colorado, Idaho, Illinois, Iowa, Indiana, Kansas, Maryland, Michigan, Missouri, Montana, Ohio, Pennsylvania, South Dakota, Tennessee, Utah, Washington and West Virginia. Estimates of the year's production are given, with forecasts relative to probable business in 1915. COAL AGE, Vol. 7.

TABLE OF COAL AND COKE PRODUCTION IN U. S. DURING 1914: *Page* 58

CANADIAN COAL PRODUCTION FOR 1914: *Pages* 59-62

Reports from mine inspectors and special correspondents in British Columbia, Nova Scotia and Alberta. COAL AGE, Vol. 7.

COAL MARKETS AND BUSINESS ASPECTS OF FUEL INDUSTRY IN 1914: *Pages* 63-67

The year has been a generally unsatisfactory one in every respect for the operators. A notable dullness marked the early part of the period, due to the generally adverse interpretation placed upon the drastic legislation, both national and state. This situation was accentuated to an acute degree by the European war. A. T. Shurick. COAL AGE, Vol. 7.

MARKETING AND SHIPPING CONDITIONS ON THE ATLANTIC COAST IN 1914: *Pages* 68-71

The year just ended was peculiarly unsatisfactory for most of the bituminous interests. Export trade was especially disappointing. Anthracite shipments increased. G. G. Wolkins. COAL AGE, Vol. 7.

THE NEW YORK MARKETS IN 1914: *Pages* 72-73

J. W. Searles. COAL AGE, Vol. 7.

THE WEEKLY AD-TALK PAGE

Evidence of Progress

THAT the kind of progress we have been boosting on this page is marching steadily forward is evidenced by the statistics from Illinois.

The 1914 report shows that 77 new locomotives were purchased in the year despite the fact that the tonnage fell over a million tons. This is about one locomotive for every six already in the service. The number of mining machines in use also increased by 116, not including, of course, those cashiered for being no longer in condition or up to date. Permissible powder sales rose over 50 per cent.

The amount of mine-run coal took a slump of nearly three million tons and slack also decreased in quantity. The reason is obvious, for prepared sizes, lump, nut, and pea increased in sales, showing that rescreened coal is in increasing demand in the market.

A bad year this for the operator, perhaps, but the manufacturer does not suffer. Difficult markets demand improved machinery. The product must be sized for a particular market. The percentage of large coal must be increased when the prices are low, and the operator cannot afford to pay for hand mining and mule hauling at the sharply competitive prices.

The only person who suffers from the stress of competition is the man who sells elegant trimmings. If the manufacturer has the stuff that "pays dividends," he has the ear of every coal operator whatever the times may be in Illinois or in any other state.

Most of the machinery and supplies that help to "pay dividends" are advertised in COAL AGE. It will pay you to keep posted on them during 1915.

COAL AGE

ONE OF THE HILL ENGINEERING WEEKLIES

Vol. 7 NEW YORK, JANUARY 9, 1915 No. 2

Results of the Year 1914 in the Coal and Coke Industries

In common with other lines of business, coal mining and coke manufacture showed a considerable falling off during the year just closed. The total production of coal in 1914 was 511,099,786 short tons, which compares with 570,315,692 short tons produced in 1913. The coke output during 1914 was 34,418,933 short tons as compared with 45,953,808 short tons produced in 1913.

> *The decrease in coal production in* 1914 *amounted to about* 59,215,906 *short tons or* 10.4 *per cent.; the decrease in coke production was* 11,534,875 *short tons or* 25.1 *per cent.*

Alabama, Colorado, Illinois, Ohio, Pennsylvania and Tennessee all showed losses of more than 1,000,000 tons in last year's production as compared with the year preceding. The decrease in Colorado's production (about 1,100,000 tons), was less than might have been expected considering the serious strike that was only settled near the end of the year. The Ohio loss was by far the greatest in proportion to the state's total output, for the decrease here amounted to about 17,000,000 short tons or more than 47 per cent.

In Pennsylvania, the decrease in the output of bituminous coal was approximately 34,000,000 short tons or 19.5 per cent. This slowing up in mining, however, did not extend to the anthracite industry, for the production of hard coal (91,448,000 short tons) was practically the same in 1914 as in 1913. Anthracite is used mostly for domestic purposes and is therefore not affected greatly by lessened industrial activity in business at large.

Coke manufacture, depending as it does on the iron trade, was greatly depressed due to the slump in the steel business. In fact, one of the chief causes for so great a decrease in Pennsylvania's coal production, was the poor demand for coke—the coke counties of Fayette and Westmoreland produced about 9,000,000 tons less coal in 1914 than in the preceding 12 months. The same situation was true in Alabama, which state ranks second in importance as a coke producer.

Fuel oil again looms large as a competitor of coal in certain fields. The consumption of coal throughout the Pacific Coast states has not increased greatly in recent years due entirely to the cheapness and abundance of oil. A number of Western railroads as well as steamships and industrial plants now employ oil as fuel. This is the chief reason the coal industry in the state of Washington has had such difficulty in holding its own. The same condition as respects oil and coal exists in Oklahoma and the Southwest, but to a lesser extent.

The mine inspector's reports, which follow, show a remarkable development in 1914 in many coal fields along mechanical lines. It is gratifying to know that operators show such willingness to carry out improvements in the face of adverse business conditions. Ready compliance with the many new laws of various states, tending to increased safety, has taken place. And it may be stated that most of the new legislative provisions require considerable money to fulfill, which of course increases the burdens on an industry where even moderate profits are rare.

As to the future, we anticipate a slow but sure recovery in the coal-mining business of this country. Next to food, coal is the greatest essential to people residing outside the tropics. Consumption for industrial purposes will always fluctuate as business fluctuates, but even in periods of depression, we must keep warm—heat our houses and offices—and we must cook our food and light our homes.

The slump in coal mining has run its course. Even if business should not improve soon, very little further decrease in consumption can occur. Besides there must come a certain normal increase aside from our industrial life, due to the constant growth in our country's population. The industry has pretty well adjusted itself to present conditions and is prepared to regain, in 1915, all that was lost in the year just closed.

Reviews of Coal Mining for 1914

Alabama

By B. M. Starnes*

SYNOPSIS—The Alabama coal production was 1,745,000 tons less in 1914 than in the preceding year. Trade and market conditions were poor throughout. Despite the depression in business, many improvements were made.

The coal mines of Alabama produced during 1914 approximately 16,140,000 tons of coal, 1,745,000 tons less than in 1913. If business had been normal the output would have been at least 20,000,000 tons, as the mines averaged only about four days per week during the entire year. Alabama will probably stand in the fifth place among coal-producing states, one place lower than in 1913.

The tonnages of coal, coke and pig iron as far back as the records go, that is since about 1870, have been as follows:

OUTPUT OF COAL, COKE AND PIG IRON IN ALABAMA

	Coal	Coke	Pig Iron
1870	13,200		11,171*
1880	380,000	60,781	68,925
1890	4,090,409	1,072,942	816,911
1900	8,273,363	2,110,837	1,184,337
1910	16,139,228	3,231,399	1,939,141
1911	15,011,853	2,756,697	1,696,999
1912	16,513,040	2,881,861	1,832,146
1913	17,884,745	3,562,624	2,057,911
1914	16,140,000	2,320,000	1,795,058†

* For 1872. † Tonnage Estimated.

While it is hard to obtain the actual number of nonfatal accidents, for many of the trivial ones are never reported to the mine inspector's office, it is estimated that their number is approximately 2000. The fatal accidents for the year will be about 120, which is about the same as in 1913. Below is a comparison of accidents in recent years.

FATAL ACCIDENTS AND ACCIDENT RATES IN ALABAMA

	No. of Fatal Accidents	No. of Employees per Life Lost	Tons per Life Lost
1900	37	336	223,603
1910	238	92	67,812
1911	209	108	71,827
1912	121	193	136,471
1913	120	206	147,060
1914	120	205	134,500

There were two explosions in Alabama mines in 1914, in which five or more were killed, namely, Jan. 10, Rockcastle mine, 12 killed, none injured; Oct 5, Mulga mine, 17 killed 12 injured.

Market Conditions for Domestic and Steam Coal

The year 1914 has been a keen disappointment to the Alabama coal operators. With three months of poor business behind them, it was only reasonable to suppose that business would improve during the early part of 1914, but the year started in with only a fair demand for lump coal, due, principally, to the mild weather. Furthermore, the demand for steam coal was far below the average for that period of the year.

During February there was an exceedingly warm spell, and business in lump coal practically came to a standstill, some operators reducing the prices as much as 50c. per ton in order to move it, but without much success, as the dealers were buying only just sufficient to take care of their immediate needs. Steam coal continued dull, though prices remained about the same. During the latter part of February the South experienced a blizzard which lasted several days. This materially aided both the lump and steam business, as there was practically no stock in any of the Southern yards, and dealers were forced to buy. However, this spurt lasted only a few days and February ended with quiet business in all grades. The first part of March was quiet, but in the latter part of the month another blizzard swept the South and the demand for lump coal increased by leaps and bounds, but on account of the extremely dull steam business many of the operators had to refuse large lump-coal orders, having no place to dispose of the steam coal.

The spring schedule on lump coal usually does not go into effect until May, but, on account of the poor demand for lump, the operators decided to make spring prices effective on Apr. 1, believing that in this way business would improve. While some orders for spring and summer shipment were taken, the months of April, May and June saw only a small percentage of the usual tonnage booked. Steam coal during this time was also quiet, as far as general business was concerned, although Mobile, Pensacola and New Orleans were taking rather a heavy tonnage for bunker purposes.

During this time business seemed to be on the verge of great improvement, as the Government was buying some coal from this district for the war ships in the gulf. Indications pointed to the Navy taking a large tonnage, and this would have been fulfilled had the vessels remained in these waters for any length of time, but they did not. The French government was also purchasing coal for its vessels in the Gulf, all of which had a tendency to strengthen the market at least locally, not so much on account of the tonnage that had been sold, as because of the confidence in the market it inspired. During May and June the mines were running on an average of about four days a week.

The July markets were like those in June, with no further developments in either the Government or French business. The local demand for both steam and lump coal was small, the retail yards still deferring their orders for fall delivery.

Anticipations of Foreign Trade Fail of Accomplishment

August saw some improvement in both lump and steam business. It was expected that owing to the European war, this district would be called upon for a large tonnage of steam coal. Realizing that should this happen, lump coal would be scarce and prices would advance, the retail yards began to order lump coal. Prices at this time were about 50c. under the regular schedule on lump for August, though the steam price remained about the same. The mines were then working about four days per week.

September brought a decided change for the better on steam coal due to the prospective business with South America. That continent had been getting its supply from Europe, but the source was now cut off temporarily. Alabama operators were asked to bid on several large South American contracts aggregating approximately 1,000,000 tons of steam coal. This strengthened the market to some extent.

---

*1524 Jefferson Bank Building, Birmingham, Ala.

Several small cargoes of coal were shipped from Gulf points to South America and negotiations were opened for larger business, but the lack of bottoms in which to ship the coal, and the lack of satisfactory financial arrangements prevented the closing of the contracts, and, up to the present time, these obstacles have not been overcome to the satisfaction of the operators. Consequently heavy business is still in abeyance. The demand for lump during this time was slightly better than in July and August, though far from normal. The mines were then running about three to four days per week.

October, November and December showed no material change in either lump or steam business, the demand being small, the mines producing only the tonnage already booked and running only about three days per week. Others closed down entirely to await a better market.

To sum up the year, business has been far below the average; prices on lump coal especially, have been lower than for years; collections have been poor, but in the face of it all, the Alabama operators have not yet lost faith.

Blacksmith Coal

The winter and spring of 1914 found blacksmith coal in excellent condition, the demand good and prices normal, from $1.75 to $1.90 for the second-grade coals, and $2 to $2.25 f.o.b. mines for the best grades. During the late spring and summer the demand declined, as is always the case during these months. Prices, however, remained unaltered. The early fall showed little change from the summer months, though the demand was slightly greater. November and December have seen a decided change for the better, and while the price remains as before, the demand is increasing rapidly. As a whole, the year has been entirely satisfactory to the operators making this grade of coal.

Furnace and Foundry Coke

The year started off with little sale for either furnace or foundry coke, though the latter was in slightly larger demand. Furnace coke suffered greatly due to the increase of $2 per ton by all lines on Western business, and shipments to Western smelters absolutely stopped. Though this rate has since been reduced $1, Alabama has never been able to regain what was lost at that time. Spring brought no improvement in either price or demand for either grade, and summer business was about the same. October, November and December show absolutely no market on furnace coke, many batteries of ovens being out, though foundry coke is moving better but in small lots only. No improvement can be anticipated until the iron market improves and furnaces go back into blast.

Lump-Coal Prices

In the next column is the schedule of prices f.o.b. mines which the operators established for the year on two of the standard lump coals of the district.

However, due to the extremely dull business during the entire year, the prices during last January and February were about as follows: Cahaba lump, $2.75; Cahaba nut, $2.25; Carbon Hill lump, $2; Carbon Hill nut, $1.75. Since that time, beginning with March, prices have been about as follows: Cahaba lump, $2.50; Cahaba nut, $2.15; Carbon Hill lump, $1.50; Carbon Hill nut, $1.25.

However, with a reasonably cold winter, the regular schedule prices will probably obtain as there is little stock in any Southern yard.

SCHEDULE PRICES OF STANDARD ALABAMA COALS IN 1914

	Cahaba Lump, Over 6-In. Screen	Cahaba Nut, From 3 In. to 6 In.	Carbon Hill Lump, Over 6-In. Screen	Carbon Hill Nut, From 2 In. to 6 In.
January	3.25	2.75	2.25	1.90
February	3.25	2.75	2.25	1.90
March	3.25	2.75	1.75	1.45
April	2.50	2.00	1.75	1.45
May	2.60	2.10	1.85	1.55
June	2.70	2.20	1.90	1.60
July	2.80	2.30	1.95	1.65
August	2.90	2.40	2.00	1.70
September	3.00	2.50	2.15	1.75
October	3.00	2.50	2.25	1.95
November	3.25	2.75	2.25	1.95
December	3.25	2.75	2.25	1.95

Steam-Coal Prices

The following are prices obtained for some of the standard steam coals:

ACTUAL PRICES OF STEAM COAL, BLACKSMITH COAL AND COKE IN ALABAMA, 1914

Pratt run-of-mine	$1.20@1.40	Black Creek gas lump	$1.65@1.75
Big Seam run-of-mine	1.00@1.10	Best grade washed and sized blacksmith coal	2.00@2.25
Big Seam washed	1.15@1.25	Second grade blacksmith coal	1.75@1.90
Cahaba run-of-mine	1.35@1.60	48-hour furnace coke	2.50@2.75
Carbon Hill run-of-mine	1.05@1.10	72-hour foundry coke	3.50@4.00
Washed slack	1.10@1.25	Coke breeze	1.50@2.00
Unwashed slack	0.30@0.50		
Black Creek run-of-mine	1.30@1.50		
Black Creek steam nut	1.65@1.75		

The car supply during the year has not at any time been a factor in the maintenance of price, for all lines were able to keep the operators well supplied because of the small tonnage shipped.

Labor Situation

Alabama has had no labor troubles during the past year, but, on account of the dull business, operators were unable to increase wages, as had been done in 1913. However, many playgrounds, schools, etc., were secured for the miners, and aside from not being able to make full time, labor is well satisfied.

Water Transportation

Water transportation of coal from this district to the Gulf has been held back by one cause or another, and while there has been considerable tonnage moved over this route, it is not as large as had been expected. The completion of Lock 17 during the early spring of 1915 will give this district navigable water the year round to the Gulf, and it is expected that a heavy tonnage will be moved over this route in 1915.

Despite Depression Some Mines Resume, Others Are Opened

Despite the unfortunate business conditions, W. T. Brown, of Ragland, resumed operations of his mine after more than a year's idleness. The Van Zandt mine No. 2 of the Raccoon Mining Co. was also reopened after having been closed for a year. The Gulf States Steel Co. fired up 300 coke ovens at Virginia City which had been out of blast for several months. The Hills Creek Co. with mines in Bibb County also resumed operations after several months' idleness.

There were also several new mines put into operation. The Maryland Coal Co. spent approximately $100,000 on new openings and general improvements and the Panama Coal Co. started developments on a large tract of coal land. When completed, the outlay will be about a million dollars.

The South Brilliant Coal Co. has opened up a new mine near Brilliant in Marion County, known as Parker

No. 1, and the Alabama Fuel & Iron Co. two new mines at Acmar, St. Clair County, known as Acmar No. 2 slope and No. 2 drift. In Jackson County, the Pierce Coal & Lumber Co. has started one of the most complete mines in the district and has built a 20-mile railroad connecting its road with the Southern Ry.

The Black Diamond Coal Mining Co. has started developments of a tract of coal land at Benoit, Walker County, and W. H. Parker, of Cullman, is opening a mine near Brilliant, Marion County. C. S. Bissell, of Birmingham, is developing a tract of coal land in Walker County. The Borden Mines at Drifton have been taken over by C. C. Gravelee of that place, and extensive improvements have been made. Extended changes in the plant of the Taits Gap Coal Co. have resulted in the doubling of the capacity of the mine.

The Iron Companies Lead in Uptodate Equipment

The Alabama Co. spent about $20,000 on repairs to its Ironaton washers and furnace in the past year. At a cost of $400,000, the Woodward Iron Co. constructed a battery of 30 modern byproduct ovens at Woodward, Ala., and in connection with this plant the American Creosoting Co. constructed one for treating timber at a cost of $250,000. It will use 6,000,000 gal. of tar annually. The Woodward Iron Co. has also installed two Mesta blowing engines each of 500 hp.

The installation cost $150,000, and 16 freight cars were required to transport the engines. The ventilators supply at full capacity 50,000 cu.ft. of air per min. The same company has begun the construction, at a cost of approximately $100,000, of the largest and most modern coal washer in the district, having a capacity of 3000 tons per day. The Sloss-Sheffield Steel & Iron Co. has completed and is operating two new washers at Russellville. The construction of these cost $125,000.

The Tennessee Coal & Iron Co. is still busy improving the social well-being of its employees. In 1914, $5000 was expended in improvements to its Edgewater bath house which is considered one of the most modern and complete in the United States. A new hospital, which is one of the most complete industrial hospitals in the South was erected by the same company at the Ensley plant. There will be one head physician, five assistants and five trained nurses.

The Woodward Iron Co. has constructed a track a mile long connecting its furnaces with the Atlanta, Birmingham & Atlantic R.R. This reduces the distance from its Mulga mines to the furnaces about six miles. The Illinois Central R.R. and the Southern Ry. have both announced that they will erect steel tipples of the most modern type at New Orleans to facilitate the handling of bunker coal. A fleet of barges is being built at its Holt, Ala., yard by the Pratt Consolidated Coal Co. for use in shipping its coal. The same corporation has purchased a modern steel collier at a cost of $30,000, to unload coal from barges and load it onto vessels at Mobile.

New Incorporations

The following companies were incorporated in 1914:

Little River Land Co. Capital, $25,000. E. R. Le Fevre, president. To develop lands near Gadsden.

The Cardiff Mining Co. Capital, $4000. L. B. Pettiford, president. To develop coal lands near Cardiff.

Canal Export Coal Co. Capital, $300,000. R. H. Elliott, president. To develop coal lands near Birmingham.

South Brilliant Coal Co. Capital, $10,000. G. H. Parker, president. To develop coal lands near Brilliant, Marion County.

Consumers' Coal & Fuel Co. S. J. Gaines, president. Opened up mine at Nauvoo, Walker County.

The Margaret Coal & Sales Co. Capital, $2000. Chas. De Bardeleben, president, Birmingham.

McKenzie Coal Co. Capital, $7500. A. P. McKenzie, president. To develop lands in Jackson County.

Wadsworth-Cahaba Coal Co. Capital, $5000. W. C. Beck, president. To operate mines at Helena.

Brown Coal Co. Capital, $2000. Watt Brown, president. To develop coal lands near Oneonta, Blount County.

Southern Mining & Milling Co. Capital, $100,000. Offices at Tuscumbia.

The Burnwell Coal Mining Co. increased its capital stock from $50,000 to $100,000.

Transportation Improvements and Restrictions

In November the first barge went up the Warrior River beyond Tuscaloosa. Within four hours it had been loaded with 700 tons of coal and was on its way to New Orleans. Following the decision of the Interstate Commerce Commission that the Birmingham Southern Ry. was a common carrier, officers of that road announced that many costly improvements and extensions would be made, the work on which would be started at once.

The railroads of the Birmingham district petitioned the Interstate Commerce Commission and the Railroad Commission of Alabama that they be allowed to increase their freight rates to practically every point in the South from 10 to 30 per cent. It is estimated that should these increases be allowed, they will curtail the output of coal in this district at least 500,000 tons. No decision has yet been rendered.

Large Transfers of Coal Land

Because the Markley Coal Co., of Mobile, failed to pay the state $120,000 for coal lands in Jefferson and Tuscaloosa Counties, John Purifoy, state treasurer, advertised for sale 500 shares of stock in the Mobile Portland Cement Co. valued at $500,000. This stock was pledged as security for this land by the Markley Coal Co.

The property of the Wadsworth Red Ash Coal Co., consisting of about 1200 acres of rich Cahaba coal lands near Falliston, Shelby County, has been purchased by R. N. McDonough, J. H. McDonough and J. T. Robertson, all of Birmingham, the consideration being about $175,000. Extensive improvements have been made.

The Maryland Coal Co., Henry T. De Bardeleben, president, Birmingham, purchased the entire holdings of W. G. Coyle & Co., of New Orleans, one of the oldest coal companies in the South. The equipment consisted of barges, tugs, three retail yards in New Orleans, mules, wagons, carts, a large fleet of steel barges, each with a capacity of 1000 tons, a tug boat and collier of modern type for transfering the coal from the barges to the vessels, a pump boat and similar equipment for the expeditious handling of coal.

It was held by the Circuit Court of Bibb County that a lease on coal lands was not taxable, and in rendering this decision they reversed that of the state tax commission, which body held that leases on mineral lands should be taxed, in addition to the impost on the land in fee simple. The decisions were rendered in the cases of the Red Feather Coal Co. and the Roden Coal Co., the property valuations of which companies had been raised $1,500,000 each by the State Tax Commission. This decision was important, as it was the intention of the State Tax Commission to raise the assessment of every lease-holding coal company in the state, according to the value of the minerals the property contained.

The largest single day's output of coal ever mined by convicts in the state of Alabama was recorded at the Banner mines of the Pratt Consolidated Coal Co. on Feb. 12, 1914, when 1846 tons were dumped. This not only breaks all previous records in convict mines, but has seldom been eclipsed by any mine in the state. Since the completion of the new steel tipple and concrete washer the output has been steadily on the increase until it has now reached the 2000-ton mark. Banner mine is owned by the Pratt Consolidated Coal Co., but is operated by the State of Alabama under a lease.

Arkansas

By Thomas H. Shaw*

SYNOPSIS—Production for calendar year will show a considerable decrease. Fatalities increase. Miners working slow turns, while many men have no employment at all. Labor disputes settled.

The coal mines of Arkansas during the fiscal year ending June 30, 1914, produced 2,136,783.59 short tons, valued at $3,631,100. This was a remarkable record considering the labor troubles during the year. There are 117 coal mines, 51 shafts, 53 slopes, 12 drifts, and 1 strip pit. There are 3300 miners, 1770 daymen, and 286 officemen and mine officials. Total number of persons engaged in the coal-mining industry, 5356.

There were 85,811 kegs of black powder used, at a cost to the miners of $171,622. The production for the calendar year will be less than 2,000,000 tons, owing to the labor troubles and slack work during the last three months.

The following mines have been idle over nine months: Mammoth Vein Coal Co. mines No. 1 and No. 6; Prairie Creek Coal Co. mines No. 3 and No. 4; Hartford Coal Co. mine No. 1; Coronado Coal Co. mine No. 1; Central Coal & Coke Co. mine No. 26. The following mines have been shut down over a year: Spadra Coal Co., Scranton Anthracite Coal Co., Dallas Coal Co. mines Nos. 4 and 8. The production for one year of all the above mentioned idle mines would aggregate 475,000 tons.

Accidents

The fatal and nonfatal accidents have greatly increased in proportion to the production during the past fiscal year. There were 15 fatal and 130 nonfatal accidents. The most prolific causes of accidents were the following: Dust and gas explosions, falls of rock on traveling roads and at the working face, being run over by trips of cars on slopes.

There were two mine explosions caused by windy shots, gas or dust, in which the shotfirers were killed. One miner lost his life while making up powder for a shot with an open light on his head, the spark dropping into his keg of powder. One top man fell into a slack bin and smothered to death.

Average Gross and Net Earnings

Sebastian County—Entrymen gross earnings, $900; net, $810. Room-men gross earnings, $620; net, $575. Bottom daymen net earnings, $610. Topmen net earnings, $500.

Franklin County—Entrymen gross earnings, $750; net, $650. Room-men gross earnings, $350; net, $310. (The great difference between the earnings of entry- and room-men was due to crowded condition of the mine and slow turn; the entrymen had all the advantage in this respect, as they could drive the entries narrow so as to make as little coal as possible and still make a wage on yardage and dead work.) Bottom daymen, $568 net. Topmen, $450 net.

Johnson County—Entrymen gross earnings, $850; net, $775. Room-men gross earnings, $750; net, $700. Bottom daymen gross earnings, $430; net, $426. Topmen net, $340.

Pope County—Entrymen gross earnings, $850; net, $750. Room-men gross earnings, $650; net, $610. Bottom daymen net earnings, $568. Topmen net earnings, $450.

Logan County—Entrymen, $650 gross; net, $600. Room-men gross earnings, $550; net, $510. Bottom daymen net earnings, $500. Topmen, $405 net.

Scott County—Entrymen gross earnings, $750; net, $650. Room-men gross earnings, $585; net, $525. Bottom daymen net earnings, $500. Topmen net, $370.

Market Prices

Sebastian County—Mine run f.o.b. cars at the mine, $1.60@1.75. Domestic coal f.o.b. mine, $2.25@2.75. Slack f.o.b. mine, $1.10@1.25. Coal semibituminous.

Franklin County—Mine run f.o.b. mine, $1.65@1.75. Domestic coal f.o.b. mine, $2.25@3. Slack f.o.b. mine, $1.10@1.25. Coal semibituminous

Johnson County—Average price for all grades of coal f.o.b. cars at the mine, $2.65. Coal semianthracite.

Pope County—Average price for all grades of coal at the mine, $3.55. Domestic coal, $4.50@5.15. Coal semianthracite.

Yell County—Average price of all grades of coal, $3. Coal semianthracite.

Logan County—Average price for all grades of coal f.o.b. cars at the mine, $3. Coal bituminous.

Scott County—Mine run f.o.b. cars at the mine, $1.70@1.75. Domestic coal, $2.25@3. Coal semibituminous.

Condition of Market Now and Labor Conditions

The coal market is very dull at present, mines in the Spadra field working half time. This season's run on hard coal has been lighter than any previous run for several years. Pope County mines are working less than half time. The average earnings of miners and other classes of mine labor will be less than last year. There are men on the list waiting for work at every mine in the state, and practically all the mines are crowded and a very slow turn of cars is the general condition. The miners have all prospects for hard times this winter. There are over 1000 men idle in Franklin and Sebastian Counties alone.

Strikes and Lockouts

The number of men locked out and on strike for one cause or another during the past fiscal year was 2354, over 46 per cent. of the total number employed at the mines. The number of days lost through strikes and lockouts up to July 1 was 619.

There are 507 men locked out at the following mines controlled by Bache & Denman: Prairie Creek Coal Co. mines Nos. 3 and 4; Mammoth Vein Coal Co. mines Nos. 1 and 6; Coronado Coal Co. mine No. 1. The above companies abrogated their contract with the U. M. W. of A. the latter part of March, 1914, discharged all their employees and ordered them to take their tools off the premises. On April 1, they posted notices that all employees would be reëmployed on a nonunion basis. April 6 a mob attacked the nonunion men and ran them out of the country. In June the mines resumed work under Federal guard. July 17 a mob again attacked the nonunion men and destroyed all the surface equipment at four mines. Value of property destroyed approximated: Prairie Creek

---

*State mine inspector, Midland, Ark.

Coal Co. mine No. 4, $27,500, No. 3 mine, $15,000; Mammoth Vein Coal Co. mine No. 1, $35,000; Coronado Coal Co. mine No. 1, $30,000.

COAL SHIPMENTS OF BACHE-DENMAN MINES

The amount of coal shipped up to July 17 was 160 tons. The first part of October Federal troops were sent to the mines. Work was resumed the first half of November with U. S. marshals guarding the mines. There are about 55 or 60 men employed now at the Griffith pigeon holes, and at No. 4 mine, cleaning up around the surface. Mine No. 7 was recently worked by the Central Coal & Coke Co. Seven cars of 44 tons each have been shipped up to this date, Dec. 28. A total of 308 tons.

Last week at the Federal Court in Ft. Smith, F. Bache, receiver for all these companies, stated on the witness stand that if he could put the coal from No. 7 mine on the car at a profit of 20c. per ton he could get Eastern capital to reopen and operate the other mines.

It is very doubtful if this can be done under any conditions of labor whether union or nonunion, for the Central Coal & Coke Co. stopped all entry work last spring, expecting to lose the lease. Rooms were turned up to the face of all entries, and they are all practically worked out. The slope is down over eight lifts, and all entries are quite a distance off the slope. Considerable development work will have to be done before any room work will be ready, and it will take almost a full crew of daymen to operate for a small tonnage. The track in the mine and practically all the surface equipment have been taken away by the Central Coal & Coke Co. The total production for all the Bache-Denman interlocking coal companies for the fiscal year ending June 30, 1913, was 231,993.15 short tons, and for the fiscal year ending June 30, 1914, was 192,980 short tons.

MINES CLOSED DOWN

Sept. 2, 1913, the miners of the Scranton Anthracite Coal Co., Montana, Johnson County, came out on strike, alleging that John E. Daly, controlling interest in the company, was a stockholder of the West Spadra Coal Co., which concern was operating its mine at Hartman nonunion. Mr. Daly gave up his lease and the mine is still idle.

In March, 1914, the miners at mine No. 26, Central Coal & Coke Co., Bonanza, demanded pay for deficient coal. The seam is 3 ft. in thickness, and the scale for this bed calls for extra pay whenever the coal will not measure 3 ft.

During the fall of 1913 the company installed electric mining machines which cut away about 4 in.; the increase for deficient coal to meet this demand would amount to 8c. per ton; the men refused to recede from their demand, and the mine was abandoned. The other strikes lasted from 5 to 30 days at the other mines, and all differences have been satisfactorily settled.

There are two nonunion mines operating in Johnson County: the Pennsylvania Mining Co., with 178 men, and the Sterling Anthracite Coal Co., employing 75 men.

OTHER INTERESTING FACTS

The capital invested in the Arkansas coal-mining industry totals $2,379,570. The mines of the state are ventilated by 58 fans and 21 furnaces, while 36 mines employ natural ventilation. For haulage purposes in the mines, 415 mules are employed.

Colorado

By A. R. Tibbits

SYNOPSIS—The production decreased 1,109,450 tons. Labor troubles are ended and better times are expected. Routt County makes record.

The coal industry of Colorado during the year just closed was not a profitable one financially. The strike dealt it a severe blow. When the mines were able to resume normal production by reason of bringing into the coal camps sufficient numbers of men to take the places of the striking miners, the European war came to minimize the business of such steam plants as depended upon Colorado coal for their fuel, and in addition, an unusually warm fall made the local markets slack. The prolonged war in Mexico also affected the production of this state as much coal was sold in Texas which went into Mexico.

However, 1915 finds Colorado free from industrial strikes and better business is now expected. The coal strike called in Trinidad, Sept. 23, 1913, was formally declared off in Denver, Dec. 10, 1914. This also ended the strike in the northern field, which had been pending over four and one-half years. No concessions were made by the operators to the striking miners to effect this settlement, but the latter abandoned their fight upon the advice of the executive body of their organization. It was a wise move and may do much to establish friendly relations between the operators and miners.

The new coal-mining law has now been in effect a little over a year and has been the means of making material improvements in most of the mines, some of the operators of small mines, either because of limited funds or failure to grasp the importance of placing each and every mine, no matter how small, on a safe and sanitary basis for best results physically and financially, have not complied fully with all the provisions of the new law, however, the operators of large properties have been very active in improving their mines, installing numerous safety devices, enforcing regulations for the safe guarding of the underground workers. In fact the general safe and sanitary conditions in and around the mines have never been so satisfactory in this state before. That the operators made such sincere efforts to place their mines on the best possible sanitary and safety basis in the face of serious labor disturbances and bad business shows a commendable spirit.

FATALITES DECREASE

The rate of fatality is less than in 1913, but not as low as could be expected under the improved conditions of the mines and can be explained by the fact that many inexperienced men took the places of the more experienced miners who went out on strike.

The normal production of Colorado is about 10,500,000 tons annually. The decrease in 1914 is 1,109,450 tons; the decrease in 1913 was 1,740,009 tons; the total production in 1912 was 11,016,948 tons, slightly over normal.

In consequence of the dull market a number of large mines have been closed down, especially in Fremont County. The coal of this county is of a very fine domestic grade and has been in great demand. In 1912 773,-

188 tons were produced and in 1914 only 168,050 tons. Las Animas County, the great coking coal producer, dropped from 4,770,292 tons in 1912 to 2,817,678 tons in 1914. A splendid exception to the foregoing is Routt County, the last to join the widely scattered coal-producing counties of this state. It has to its credit an increase of 314,939 tons and a total production of 647,505 tons in 1914. This coal is of the non-coking bituminous variety which can be stored in the summer months and much of it is sold out of the state.

There was no car shortage as has been the case in former years. There were bumper crops in all parts of the state, but their freighting did not interfere with the coal shipping.

Colorado has enormous coal fields which have hardly been touched and the coal is of the best varieties ranging from a good lignite to anthracite, and no doubt when business improves and the manufacturing of goods is encouraged in the West, Colorado will take her place as one of the great coal producers in the United States. All this state needs is markets for its production.

SUMMARY OF COLORADO COAL PRODUCTION, 1914

Counties	Tons
Archuleta	2,601
Boulder	965,381
Delta	83,485
El Paso	269,501
Fremont	168,050
Garfield	119,179
Gunnison	399,347
Huerfano	1,690,625
Jackson	43,882
Jefferson	136,850
Las Animas	2,817,678
La Plata	139,831
Mesa	171,408
Montezuma	614
Pitkin	66,589
Routt	647,505
Weld	436,963
Total	8,159,489
Lignite coal	1,855,795
Semibituminous coal	414,124
Bituminous coal	5,838,774
Anthracite coal	50,796
Decrease	1,109,450
Average number of men employed in and around the mines	10,960
Total number of days worked	188

* * *

Idaho

By Robert N. Bell*

SYNOPSIS—Idaho only produces 2000 tons per annum and depends almost wholly on Wyoming and Utah for its fuel. There is a good deposit of coal, however, which should be mined extensively, as a large market is available.

While rich in other nonmetallic commercial minerals, Idaho is hardly worthy of a place in the list of coal-producing states, as its total output during the past year will aggregate only about 2000 tons, which is the largest annual yield to date.

We are at a serious disadvantage in this respect, and have annually to pay a tribute of millions of dollars for our coal requirements to the neighboring states of Wyoming and Utah, from whence the bulk of Idaho's coal supply is imported. Patent was issued somewhat over a year ago to a limited acreage of promising coal land in the eastern portion of this state, near the Wyoming line.

Idaho Has Some Good Coal

This property has already been subjected to much preliminary development work and now has disclosed a series of steep pitching beds of high-grade sub-bituminous coal having low moisture, ash and sulphur contents and high-heating value for steam and domestic purposes. The workable beds are quite free from bone and range from 3 to 10 ft. in thickness.

There are four of these, all in the cretaceous sandstone and shale foothill formation tributary to the agricultural settlements of our upper Snake River Valley. There is a tributary population of 150,000 people within 100 miles. The deposits are situated 12 miles from the nearest railroad point but could be reached by a road with easy grades.

Their limited production has all been absorbed by the ranchers of the region, who haul the coal in sleighs and wagons during the fall and winter season. The deposits are somewhat disturbed by cross-faulting, which, however, does not seriously injure or crush the coal, and only causes local displacement.

Competent authorities who have examined these deposits estimate a resource of five million tons within 500 ft. of the surface outcrop, and the prospects warrant exploitation. If financed on a legitimate scale and intelligently handled, they should afford a splendid investment, by reason of the readily available local market which now pays from $7 to $9 per ton retail price on ordinary soft coal.

IDAHO KEPT IN COLD STORAGE SUBJECT TO THE ORDER OF THE EAST

Over 90 per cent. of Idaho's rock formation is of crystalline and metamorphosed varieties notably rich in metals, especially lead, silver, gold, copper and zinc, which afford a prosperous metal-mining industry.

Our state is also as rich in high-grade rock-phosphate resources as Pennsylvania is in coal. Owing, however, to the present land-grabbing instincts of the Eastern conservation theorists, in regard to this practically exhaustless asset, it is doubtful if this state will ever enjoy the industrial advantages which have been accorded the older states in the development of their resources. Rights to the land we inhabit were originally guaranteed to Idaho by the Federal Government, but it now seems inclined to give the Far West a taste of the methods of domination typical of imperialistic Prussia.

Illinois

By Martin Bolt*

SYNOPSIS—A declining market may reduce production, but the use of machinery increases as fast as ever, as the Illinois record shows. Though fatal accidents, disregarding disasters, decreased, nonfatal accidents increased, suggesting the effect of compensation. The use of permissible explosives is increasing.

Coal mining in Illinois made no gain in the year ending June 30, 1914, but rather declined, due to hard times, the ouput showing a decrease of 1,130,409 short tons from that of the preceding year.

---

*Mine inspector, Boisé, Idaho.

*Former chief clerk, Illinois State Mining Board, 1526 College St., Springfield, Ill.

The reasons for the loss in tonnage are as follows: (1) Labor troubles, caused by the making of new contracts. (2) A general depression which closed down a large number of the factories entirely, and placed many others on half the regular working time or less, thus cutting down the demand for coal. (3) The fact that other states have access to Illinois markets, thus restricting the natural output of coal in this state.

Several Mines Have Not Resumed Since Apr. 1

The probable output in short tons from the shipping mines for the calendar year 1914 will be, in round numbers, 59,500,000 tons. These figures are based on the fact that the shipping mines during the first half of the year 1914 showed a loss in production of nearly 1,500,000 tons as compared with the same period in 1913.

ILLINOIS COAL STATISTICS FOR THE YEAR ENDED JUNE 30, 1914 AND 1913

Summary	1914	1913	Increase	Decrease
Number of counties producing coal	52	50	2	......
Number of mines and openings of all kinds	796	840	......	44
New mines or old mines reopened during the year	89	88	1	......
Mines closed or abandoned since last report	133	125	8	......
Total output of all mines, in tons of 2000 lb	60,715,795	61,846,204	....	1,130,409
Number of shipping or commercial mines	340	371	......	31
Total output of shipping mines, tons	59,379,182	60,515,416	....	1,136,234
Number of mines in local trade only	456	469	......	13
Output of local mines, tons	1,336,613	1,330,788	5825	......
Total tons of mine run coal	12,026,123	14,979,990	....	2,953,867
Total tons of lump coal	22,311,693	20,850,125	1,461,568	....
Total tons of egg coal	6,621,986	6,819,980	....	197,994
Total tons of nut coal	3,438,771	3,130,065	308,706	......
Total tons of pea coal	14,228,230	13,734,437	493,793	......
Total tons of slack coal	2,088,992	2,331,507	......	242,515
Total tons shipped	45,038,119	55,972,374	....	*10,934,255
Tons supplied to locomotives at the mines	709,591	904,570	......	194,979
Tons sold to railroad companies and loaded on cars	10,096,939	......	10,096,939*	......
Tons sold to local trade	2,400,985	2,345,133	55,852	......
Tons consumed (or wasted) at the plant	2,470,161	2,624,127	......	153,966
Average days of active operation for shipping mines	174	179	......	5
Average days of active operation for all mines	162	170	......	8
Number of locomotives in use	543	466	77	......
Number of mining machines in use	1,805	1,689	116	......
Number of tons undercut by machines	31,446,823	30,228,520	1,218,303	......
Number of tons mined by hand	29,268,972	31,617,684	......	2,348,712
Average number of miners employed during the year	32,262	35,401	......	3,139
Average number of other employees underground	39,281	35,662	3,619	......
Average number of boys employed underground	1,492	1,430	62	......
Average number of employees above ground	7,000	7,004	......	4
Total number of employees	80,035	79,497	538	....
Average price paid per gross ton for hand mining, shipping mines	0.6575	0.664	......	0.0065
Average price paid per gross ton for machine mining	0.524	0.521	0.003	......
Number of kegs of powder used for blasting coal	1,193,456	1,309,382	......	115,926
Number of kegs of powder used for other purposes	4,150	3,685	465	......
Number of pounds of permissible explosives used	930,596	603,420	327,176	......
Number of men accidently killed	159	175	......	16
Number injured so as to lose 30 days or more time	1,071	1,025	46	......
Number of gross tons mined to each life lost	381,860	353,407	28,453	......
Number of employees to each life lost	503	454	49	......
Number of deaths per 1,000 employed	1.99	2.21	......	0.22
Number of gross tons mined to each man injured	56,691	60,338	......	3,647
Number of employees to each man injured	75	77	......	2

*These large changes are evidently due to a more complete method of classification.—Editor.

The loss for the last half of the year may be assumed as 1,000,000 tons, but it may well exceed that figure because of the mild weather, and, further, because there are a large number of shipping mines throughout the state that have not been placed in operation since they were closed down on Apr. 1.

There have been no serious labor troubles in the mines of Illinois in the year 1914, although there was some delay in reaching an agreement, and some of the mines were closed down pending the signing of the new contract, while some continued to operate under the old scale. Some local strikes have taken place, as in previous years, but these do not materially affect the output. They are much to be regretted, as they are the cause of much bad feeling. Such differences should not arise in the coal industry of Illinois, provided, as it is, with such a detailed agreement and such a carefully specified method of conciliation.

Owing to Royalty Explosion, Accident Rate Rises

Accidents in the mines of Illinois have increased and decreased at about the same ratio as the tonnage. The number of fatal accidents for the year ending June 30, 1914, was 159, as compared with 175 for the preceding year. Based on these figures, the number of fatal accidents for the calendar year should be less than they were in the year of 1913. This is not true, however, as an explosion which took place since the close of the fiscal year caused the death of 52 men, and this will bring the number of fatal accidents for the calendar year above what it was in 1913.

The nonfatal accidents will also show an increase. The figures show for the year ending June 30, 1913, 1025 nonfatal accidents, and that in the year ending June 30, 1914, the number was 1071. There is every reason to think that the same relative increase will prove to have been maintained for the calendar year 1914.

There will be shown also a large decrease in the number of shipping mines, and the loss on tonnage will be found to be all in this class of operations. The local mines will show a slight increase in tonnage for the year 1914.

There have been no new mines of any importance placed in operation during this year. There are one or two that will begin to operate some time in 1915; one of these mines is in Franklin and the other in Vermilion County.

Taking all things into consideration, the coal-mining business in Illinois is in a worse condition than it was one year ago, and there is no sign of an early improvement. The cold weather of the past few weeks has increased business, but more than cold weather is needed to bring about normal conditions.

Indiana

By Frank I. Pearce*

SYNOPSIS—A bad year for miners and operators. The average wage decreased from $736.06 to $681.50 per man per annum. The "bituminous" coal tonnage fell 2.8 per cent. but the block coal output declined 29 per cent.

The demand for coal, the market prices, and mining conditions for the fiscal year ending Sept. 30, 1914, were exceptionally poor. Both miners and operators suffered from the adversities of the coal trade.

---

*Department of Mines and Mining, Room 120, State Capitol, Indianapolis, Ind.

The slackness was due to a general business depression and an extremely mild winter. The low prices resulted, in a large measure, from the sharp competition into which the operators entered in order to secure a market for their product. A number of mines were closed down during the entire year, and a large percentage were operated less than half time. The wage scale made two years ago when better mining conditions prevailed and which was renewed again this year without a suspension of work is the highest in the history of the state.

The operators, therefore, faced the proposition of an unusually slack market, high prices for labor, steel rails, spikes, nails, timbers, machinery, etc., and low prices for their production. The miners, on the other hand, faced the proposition of a high-wage scale and small demand for their services. The operators and miners at one or two points in the coal field are also beginning to experience much competition from coal stripped by steam shovels. In many instances this coal is produced at an extremely low cost, and as a result it is being sold at a much lower price than that at which it can be mined from a shaft, slope or drift. The outlook for next year, however, is somewhat brighter, and the indications now are that the production will equal and probably exceed the largest hitherto in the history of the state.

TABLE SHOWING THE TONS OF COAL PRODUCED AND WAGES PAID TO MINERS IN INDIANA FOR THE FISCAL YEAR ENDING SEPT. 30, 1914, BY COUNTIES, THE BLOCK AND BITUMINOUS COAL BEING SHOWN SEPARATELY

Counties	Block	Wages Paid Block	Bituminous	Wages Paid Bituminous	Total Production	Total Wages
Vigo	82,397	134,614.96	4,640,919	4,128,622.88	4,723,316	4,263,237.84
Sullivan			3,152,083	3,000,108.12	3,152,083	3,000,108.12
Greene			2,388,182	1,948,198.91	2,388,182	1,948,198.91
Vermilion			2,213,686	2,136,983.36	2,213,686	2,136,983.36
Knox			1,576,567	1,239,892.41	1,576,567	1,239,892.41
Pike			602,032	516,880.79	602,032	516,880.79
Warrick			515,368	425,218.08	515,368	425,218.08
Clay	198,899	308,053.17	266,049	254,140.44	464,948	562,193.61
Parke	28,285	42,061.22	311,397	280,968.97	339,682	323,030.19
Vanderburg			295,469	317,333.85	295,469	317,333.85
Gibson			251,379	223,003.36	251,379	223,003.36
Daviess			89,506	93,499.96	89,506	93,499.96
Fountain			19,710	15,616.84	19,710	15,616.84
Perry	3,250	2,787.35			3,250	2,787.35
Total	312,831	487,516.70	16,322,347	14,580,467.97	16,635,178	$15,067,984.67

Production

The total production for the year was 16,635,178 short tons, or a decrease of 611,387 tons in comparison with the production of the previous year. Of this tonnage, 16,322,347 tons were bituminous coal, which is 478,633 tons or a fraction over 2.8 per cent. under the production for the year 1913, and 312,831 tons were block coal, which is a decrease in production of 132,754 tons or a fraction over 29 per cent. less than the output for the previous year. Of the total production, 9,434,817 tons or a fraction over 56.7 per cent. was mined by mining machines, and 7,200,361 tons or 43.3 per cent. by hand.

In producing this coal, 500,234 kegs of black powder were used, 19,799 lb. of "permissible explosives" and 149 cases of "Hoynesite" safety powder. While it is true that much time was lost owing to the shortage of railroad cars and the occurrence of local strikes, of which there were many, yet the larger part of the time lost may be attributed to the dullness of trade.

Vigo County last year, as also in the year 1913, led in production. Last year it exceeded Sullivan County, its nearest rival, by 1,571,333 tons. This was due to the increased development in Vigo County during the past two years.

Distribution

Of the bituminous coal, 9,908,053 tons were consumed in Indiana, and 6,414,294 tons were shipped to other states. Of the block coal, 137,715 tons were consumed in this state and 175,116 tons were shipped out. A fraction over 60 per cent. of the total production was consumed within the state limits. Thus, there is a slight increase in the percentage of home consumption over that of last year.

Cost of Production

The total wages paid, as reported from the bituminous field, were $14,580,467.97, making the average cost of labor a fraction over 89c. per ton. The total wages paid in the block-coal field were $487,516.70, or a fraction over $1.55 per ton for the labor cost of production, which is an increase of about 4c. per ton over that of last year. These figures as a whole, however, show a slight decrease in the labor cost per ton for the total production of bituminous and block coal over that of last year.

Market Prices

The market prices for mine-run bituminous coal (except yearly contracts), f.o.b. cars at the mine during the year ranged from about $1 to $1.15. There was, however, during the year much coal sold for less than $1, especially during the months of June, July and August, while there was but a small amount of coal sold for $1.15. The market selling price for screened block coal (except on yearly contracts) f.o.b. cars at the mine from Oct. 1, 1913, to May 31, 1914, ranged from $2.10 to $2.25 per ton, and from June 1 to Sept. 30, 1914 from about $2.10 to $2.15 per ton. These figures show a marked decrease in the average selling price in comparison with that of the previous year.

Employees

The total number of employees for the year was 22.110, or an increase of 427 over those working last year. Of this number, 21,086 were bituminous and 1024 were block-coal mine employees.

Days Worked

The aggregate number of days the mines were reported as being in operation was 23,927, and the number of days idle, due to lack of orders, 14,798; due to a scarcity of railroad cars, 1125; owing to local strikes, 194; to permit the workers to attend funerals, 27; and on account of other causes, 1818.

Average Wages

The total wage reported from the bituminous field being $14,580,467.97, makes an average earning of $691.47 for each bituminous employee. The total wages paid to block-coal employees being $487,516.70 shows an average earning of $476.09. The aggregate wages for the state being $15,067,984.67 and the total number of employees, 22,110, shows an average earning of $681.50 for each mine employee in the state, as compared with $736.06 for each mine employee for the year 1913.

New and Abandoned Mines

Eight new mines (all of which with the exception of one or two will be large producers) were opened up during the year, and 22 were abandoned. Of the latter, there were a number that had a production of several hundred tons, and could have been worked both successfully and profitably for some time were it not for the large amount of expense necessary to keep them in repair during idle days that they might be ready to operate when orders were obtainable.

Fatalities

During the year there were 49 fatalities, the causes of which were as follows:

Falling slate at the face	9
Use of explosives (including firing of shots)	9
Mine cars and motors	7
Falling slate on haulage and traveling roads	5
Explosions of firedamp	5
Electric shock	4
Falling coal at the face	3
Falling down shaft	1
Mine cages	2
Railroad cars	1
Mining machines	1
Bursting steam pipe	1
Falling while lifting lump of coal	1
Total	49

This does not include accidents occurring in mines employing less than ten men and in clay mines and strip banks over which this department has no jurisdiction. The mining of clay and shale is rapidly becoming an important industry in this state. There are also several strip banks. In these operations, and in mines employing less than ten men, there is a total production of about 420,000 tons, and about 2500 to 3000 persons are employed. In most of the clay mines there is a small production of coal, which is used in the manufacture of clay products.

Safety and First-Aid Work

The movement for prevention of accidents, now most commonly known under the slogan of "Safety First," is gradually finding favor with both operators and miners. The National First-Aid Meeting held at Terre Haute, Ind., Sept. 12, under the auspices of the American Mine Safety Association and the Indiana Bituminous Coal Operators' Association had much to do with the progress of this important work. A large number of teams from the coal mines of Indiana were competitors in the events and won a number of prizes. It is the hope of the leaders of the "Safety First" and first-aid movements that a competitive state meeting of this kind will be held each year in the future.

A campaign of education with a view to accident prevention has been waged both prior to, and since this meeting, and the movement has been making gratifying progress. As this campaign of education advances, the importance of this work will be more fully appreciated. It is thought that three men whose lives were lost in the mines of this state during the past year, might have been saved had they been given artificial respiration in a proper maner for a sufficient length of time.

As has been stated, there were employed in and about the mines an average of 22,110 employees and 16,535,178 tons of coal were produced. These figures show a fraction over 2.22 persons killed per thousand employed and 357,861 tons per fatality, which is far better than the general average of the United States. This fatality rate, however, is far too high, and it is hoped that with the earnest coöperation of the mine operators and miners, both individually and collectively, it will be materially reduced.

Iowa

By L. E. Stamm*

SYNOPSIS—Output is practically same as in 1913. Many mines are installing mining machines. Labor difficulties seldom occur.

Statistical information relative to the Iowa coal industry is gathered by the Iowa Mine Inspectors Department for a fiscal year ending June 30. The statistics for the last half of the year 1914 have not yet been compiled, so that in making a review of the industry I am called upon to form an approximate estimate based on information furnished for the first half of the year, together with working conditions and reports of accidents received up to the present time.

The statistics for the fiscal year ending June 30, 1914, show that Iowa produced for that period 7,512,754 tons of coal. There were 258 mines in operation in 23 coal-producing counties in the state; 15,740 men were given employment in and around the mines of Iowa. The statistics relating to accidents in the mines show that there were 34 fatal and 161 nonfatal accidents for the fiscal year. The fatality rate per thousand employees was 2.1 per cent.

There was little change in the coal production during the first half of 1914 as compared with that of the first half of 1913. Working conditions were pretty much the same, and I am, therefore, led to believe that for the calendar year 1914 the state will show a production of at least 7,500,000 tons of coal, with more than 15,000 men employed, and an average working time of probably about 220 days. This takes into consideration the prevailing warm weather of September, October and November, when the demand for coal was light, and the majority of the mines were working but three and four days each week.

The United States Geological Survey in its tabulated figures of the coal industry of all the coal-producing states in the United States for the calendar year 1913, just issued, shows Iowa as ranking 10th in coal production by states, the production for the calendar year 1913 being 7,525,936 tons. As conditions in the coal production in Iowa during the year 1914 did not differ materially from conditions in 1913, I have reason to believe that my figures as given for calendar year 1914 will prove approximately correct.

Fatal Accidents

From July 1, 1914 to the present time, but 14 fatal accidents have occurred in the Iowa mines. This compares favorably with the statistical data on fatal accidents, which show the average fatal accidents in the Iowa mines in the past 19 years to be 30.3, while for the past ten years the average fatalities have been 32.5.

---

*Secretary to Iowa mine inspectors, Des Moines, Iowa.

During the year 1914 considerable progress was made in and around the mines in bettering the facilities for coal production. In the agreement entered into between the miners and operators in April, 1914, to continue for two years, a scale of wages for machine mining was included, and since the signing of that agreement, a number of mines in the state have installed mining machines which will tend to increase the coal production of the state. Also a number of mines in the state have been equipped with electric hoists and electric haulage during the past year, while others have so reconstructed their top works, screens, etc., as to better facilitate the handling and grading of their product. There seems to be an increased incentive to still greater activity along these lines, as a number of other mines are contemplating like improvements.

Notwithstanding that coal is produced in twenty-three counties in Iowa, yet the bulk of the coal produced is mined in the counties of Monroe, Polk and Appanoose in the order named. For the fiscal year 1914, these counties alone produced 5,280,920 tons of coal. Considerable development work is in progress in Marion and Lucas Counties along the line of the new C. R. I. & P. Railway. These include some of the largest operations in the state, and the outlook is bright for an increased coal production in these counties.

Few Labor Troubles

But few labor troubles occur in the mining industry of this state. This is owing to the fact that both the operators and the miners have an organization, and a working and wage agreement is entered into by them for a period covering two years. The labor difficulties that do arise are chiefly local to the mines and are usually quickly adjusted by the representatives of both of these organizations. It has been the custom in former years to suspend operations at the mines while the miners and operators were agreeing upon a scale of wages and working agreement. However, a new precedent was established in April and May of 1914 when the representatives of both organizations met to perfect an agreement, the miners continuing their work while the agreement was being made. The new wage agreement will be in force until April, 1916, and it is not likely that any serious disturbance in the mining industry will occur during the life of the agreement.

Kansas

By Francis Keegan*

SYNOPSIS—Kansas has not suffered severely from the business depression. Unfortunately, the number of fatalities increased owing to a cage accident where six men were killed.

Conditions in the coal industry of Kansas were similar in 1914 to those existing in the year before. Seeing that under the law, statistics covering the coal production of the state are compiled by the Mine Inspection Department for the fiscal period ending June 30 of each year, no returns are available based on the calendar year.

The records in this office when completed will show that approximately 7,100,000 tons of coal were produced during the fiscal year ended June 30, 1914, and the production for the year ending Dec. 31, based on that produced during the fiscal year, will amount to 7,200,000 tons. This is a slight decrease in production compared with that which the year 1913 shows.

Only Work 200 Days in Year

The number of employees in the mines of the state will not be materially changed from that of the year 1913, which was 12,506. The number of days worked in the year will average 200.

During the year ended Dec. 31, 1914, there were 32 fatal accidents in and around the mines of the state. Compared with the year 1913, this is an increase of four fatalities. Mine explosions are still contributing their share to the number of deaths in the mines of the state. The necessity of installing electrical shotfiring devices in the mines is being more generally admitted, and I have no doubt that within a few years all the deep mines in the state at least will be equipped with electrical shotfiring devices, thus protecting the lives of the shotfirers.

The most disastrous accident in Kansas coal mines in many years was caused by the fall of a cage in Mine No. 7 of the Spencer-Newland Coal Co., at Mulberry. It is due to this accident that the number of fatalities at the mines increased during the past year. On the morning of Jan. 14, 1914, the engineer at this mine was lowering a load of six men when the cable parted about half way in the shaft. The safety catches failed to work and the cage with its human freight dropped to the bottom, the shaft being 130 ft. deep. All six men were fatally injured.

Steam-Shovel Development Extensive

Many improvements have been made in the mines of Kansas during the past year, especially in ventilation and sanitary conditions. The future looks bright for the industry of the state. Crawford County keeps forging ahead until today almost 70 per cent. of our coal production comes from this county. Several new mines have been opened during the past year, and the steam-shovel business is continually assuming larger proportions.

Owing to a disagreement between the Coal Operators Association and the United Mine Workers of America regarding the proper interpretation of the joint agreement, a strike was called by the mine workers officials on Nov. 1 at the mines of the Cherokee & Pittsburg Coal Mining Co., better known as the Santa Fé mines. At the present writing this strike is still in progress, but everyone is hoping that a satisfactory adjustment of the difficulties will soon be reached. Aside from this there has been no serious interference with the operation of the mines of the state during the past year.

Maryland

By William Walters*

SYNOPSIS—Output shows little change. There were 11 fatalities, 10 resulting from roof falls. A new workmen's compensation law.

The coal production of Maryland for 1914 will be about the same as for 1913, when the total output was 4,748,400 short tons.

---

*Assistant commissioner of labor, in charge of Mine Inspection Department, Department of Labor and Industry, Topeka, Kan.

*State mine inspector of Maryland, Frostburg, Md.

There were no labor troubles during the year. Unfortunately more fatal accidents happened during 1914 than in the preceding year, 11 fatalities being reported from May 1 to Dec. 31. Ten of these accidents were caused by falls of rock and one by cars.

The last session of the Maryland legislature passed a workmen's compensation law, which went into effect on Nov. 1, 1914. The casualty and indemnity companies have been slow to quote a rate on this mine insurance. To insure in the state fund means the payment of $5 per year on every monthly salary of $100, or in proportion thereto. In case of death, the widow will be paid 50 per cent. of the weekly average pay; minors, a certain definite proportion. The running indemnity is not to be less than $5 nor more than $12 per week in any case.

Michigan

By Thomas Kanary[1]

The production of the state will doubtless prove to be about 1,200,000 tons when the reports from all sources in this state have been received. Of this, about a million tons were mined by machines. There were no labor disturbances in the past year. Only one new opening was made. This was near the Fordney and Chapel No. 2 mines in the City of Saginaw.

The Handy Bros. Mining Co. abandoned their No. 1 Shaft at Akron, in Tuscola County, and the Jackson Coal Co. ceased to operate the shaft in Calhoun County near Albion, but the latter will be reopened later.

Missouri

By J. P. Hawkins[2]

The coal output of Missouri for 1914 is approximately 4,000,000 tons, or about the same as the 1913 production. The year was practically free from labor disturbances, but fatal accidents in the mines increased, there being 19 fatalities as compared with nine fatal accidents in the year preceding. On the other hand, there were fewer nonfatal accidents during 1914, the nonfatals for the last year being 36, as compared with 73 for 1913.

Montana

By John Sanderson[3]

SYNOPSIS—The output was less than last year. There were 12 fatal accidents and 52 nonfatal.

The State of Montana employed 3660 men during the year 1914, producing 2,938,671 tons, valued at $4,714,023. The number of tons produced per life lost was 244,889, and for each serious accident, 56,513. The number of men employed for each fatal accident was 305; for each nonfatal accident, 70.

The percentage of men killed per 1000 employed was 3.27; number seriously injured per 1000 employed, 14.

There were 64,342 kegs of powder used in breaking down coal. The number of tons of coal mined by machines amounted to 1,093,985; hand-mined and shot off the solid, 1,844,686 tons. The percentage of machine-mined coal was 37.

New Mexico

By Rees H. Beddow[4]

SYNOPSIS—The past year showed a record output. There is a scarcity of miners in the winter months. No labor troubles. Fourteen fatal accidents.

The demand for coal and coke from New Mexico has been somewhat restricted on account of the revolution in Mexico, and the war in Europe. Considerable coal is exported from this state to Mexico, when conditions are normal, and the copper mines of Arizona which are supplied with coal and coke from this state have been obliged to reduce their orders on account of their inability to export copper to Europe, owing to the European war. Yet the demand for our coal is gradually increasing, and the production is greater this year than ever before.

The gross production for the fiscal year, Nov. 1 to Oct. 31, amounted to 3,826,885 tons, valued at the mines at $5,588,352.17. The production of coke during the fiscal year amounted to 405,127 tons, valued at the ovens at $1,341,731.62; value of coal and coke combined, $6,930,083.79.

Labor conditions have been fairly good. There has been no labor trouble between the companies and their employees for many years. During the winter months more men could be employed at most of the mines, but there is a scarcity of miners in this state during the winter months.

The industry has been fortunate this year in not having any mine explosions. This has been due, to a great extent, to taking better precaution in blasting and in guarding against the dangers arising from the accumulation of coal dust in the mines. This problem is a difficult one in this state on account of the atmospheric conditions prevailing. The humidity of the atmosphere is relatively low, and large volumes of air entering the mines absorb the natural moisture of the workings, leaving the coal dust in a very dry and inflammable condition, thus making the coal-dust problem the most dangerous one we have to face.

A summary of coal and coke production, and other data pertaining to the coal-mining industry, in the State of New Mexico, from Nov. 1, 1913, to Oct. 31, 1914, follows:

Number of mines in operation	44
Number of mines abandoned	10
Number of new mines opened	2
Tons of bituminous coal produced	3,025,786
Tons of sub-bituminous coal produced	741,912
Tons of anthracite coal produced	59,187
Total number of tons of coal produced	3,826,885
Tons of coal mined by hand	3,413,654
Tons of coal mined by machines	413,234
Total number of machines used	32
Total value of coal produced	$5,588,352.17
Number of tons of coke produced	405,127.70
Total number of coke ovens	980
Value of coke produced	$1,341,731.62
Number of employees in and about the mines	4,021
Number of employees about the coke ovens	291
Total number of employees	4,312
Number of fatal accidents	14
Number of nonfatal accidents	95
Tons of coal mined for each life lost	273,348.9
Number of employees for each life lost	308
Number killed for each thousand employed	3.24

Ohio

By J. W. Lehman

SYNOPSIS—Production was only about one-half as large as in 1913. The important Eastern field has been shut down since Apr. 1. Lake trade was very poor. Outlook is uncertain.

The coal trade in Ohio for the year 1914 was a disappointment to all concerned. In the face of excellent prospects at the beginning of the year, labor troubles intervened, which together with a business depression of a widespread nature, have combined to cut the total production to about 50 per cent. of the total of the previous year. In 1914 the total Ohio production will be reduced to approximately 19,000,000 tons, which compares with 36,285,468 tons in 1913.

At the close of the year only a portion of the state was being operated and that on a limited basis. Attempts to settle the wage agreement in eastern Ohio and Coschocton districts have all failed and it is extremely doubtful if a settlement will be reached before the convening of the Ohio General Assembly.

But, on the other hand, there has been a few bright spots in the Ohio trade which have helped to make the year one of better returns than might otherwise be supposed. There has been no car shortage at all and that has helped in the free movement of coal. Dealers and wholesalers have learned a great deal from the lessons of the year and they are in a better position to stand the dullness than formerly. Coöperation and a better feeling among coal men generally have taken the place of cutthroat competition which has characterized the trade in former years.

At the beginning of 1914, the outlook was excellent and the demand for all grades was fairly good. There were prospects of a suspension after Apr. 1 when the mining scale was scheduled to expire, and the stocking movement stimulated trade to a certain extent. So the months of January, February and March were characterized by activity in all fields. Practically full time was worked by most of the operators during that period and steam users stored quite a surplus of fuel. Prices ruled firm and while they were not high they were sufficient to yield a small and substantial profit.

All Mines Shut Down Apr. 1

Apr. 1 all of the mines of the state closed down because of the expiration of the wage agreement and the failure to formulate a new one. After a number of conferences in which operators from all the coal-producing districts of the state participated, a break in the ranks of the operators occurred. The Hocking Valley district including Jackson, Pomeroy Bend and Crooksville decided to treat alone and agreed to pay 47c. per ton for machine-mined coal on the mine-run basis.

It was not until Aug. 1, when this agreement was reached, that the mines were placed in operation. Cambridge and Massillon soon followed suit and before long all of the state, with the exception of eastern Ohio and Coshocton, was in operation. But the field still idle was by far the largest district of the state and comprised the counties of Belmont, Jefferson and Harrison. These counties in 1913 produced upwards of 16,000,000 tons of coal.

Another factor appeared early in the year which tended to confuse the situation in the Buckeye State. This was the passage of the Ohio "Mine-run" law in February, 1914, which became effective in 90 days. Instead of using the old screen system, which had been in vogue for years, the law provided that the miners should be paid for all the coal mined whether lump or slack.

This law was strongly opposed by the operators from all parts of the state. The miners' officials led by Senator William Green succeeded in having the law enacted after a long struggle. The fact that it became operative soon after the expiration of the wage agreement tended still more to make it a difficult matter to settle the wage scale. Then, too, the demand was falling off, due to the business depression, and when the European war broke out, operators were not as anxious as formerly to concede anything in order to have the scale settled. This applies more particularly to the situation in eastern Ohio.

While the mines in Ohio were idle, West Virginia operators sought to take advantage of its markets and flooded the Buckeye State with coal. When the business depression started there was a large quantity of very cheap coal on the local market. In some instances the small sizes were given away for freight and accumulated demurrage. These facts tended to demoralize the market and when Ohio mines resumed, prices were low. But despite these disadvantages many of the mines were operated at a small profit.

The price list during the year was steady except in June, July and August. The circular figures at the beginning of the year were $1.50 for domestic lump; $1.35 for three-quarter inch and $1.15 for mine-run. This circular prevailed until Sept. 1 when a new circular was put into effect increasing the prices as follows: $1.60 for domestic lump; $1.45 for three-quarter inch and $1.20 for mine-run. While these prices have not been adhered to steadily, the actual figures were not a great deal below those levels. Towards the close of the year the actual prices were: Domestic lump, $1.50; three-quarter inch, $1.35; and mine-run, $1.05 to $1.10.

Slack Was Given Away

The market for the small sizes was a peculiar one during the greater part of the year. At first there was a fair market for nut, pea and slack, prices ranging from 45 to 55c. Toward the close of the rush just previous to the suspension, there was a slight drop from those figures. But with the influx of West Virginia coal and the falling off in demand the market broke abruptly and prices went down to 20 to 30c. As stated above there were a number of instances where coal was sold at even less. Demurrage accumulated on cargoes of fine coal and many cars were given away. But this situation changed toward the latter part of the year, due to the decreased production of domestic grades and the closing of the lake trade. As a result, prices again ascended until they reached 60 to 65 cents.

One of the results of the enactment of the mine-run law was that more attention is now given to preparation. Formerly, all Ohio operators made the grades of lump, three-quarter inch, nut and mine-run. In competition with West Virginia and Kentucky coals, it was evident that a larger lump found a better market and some of the Ohio operators in rebuilding their tipples provided for a three-inch lump. In some cases even four-inch lump is made. The three-inch product, commonly known as rescreened lump sells for about 10c. more than coal prepared as formerly over an inch-and-a-quarter screen.

TIPPLES HAD TO BE REBUILT

With the enactment of the mine-run law came the necessity for rebuilding tipples in order that the legal method of weighing could be followed. During the suspension beginning Apr. 1, many of the operators in Pomeroy Bend and the smaller districts rebuilt their tipples in order to weigh all of the coal produced before it was screened. Where the tipples had not been rebuilt, a temporary agreement was entered into between operators and miners for weighing the coal at different times, but mostly with the same scales. Several of the larger companies have put off the rebuilding of their tipples in the hope of having the mine-run law repealed at the coming session of the Ohio General Assembly. The cost of rebuilding tipples in Ohio is estimated at from $12,000 to $15,000 each wherever the tipples are too squatty for screening and must be made higher.

Throughout the strike, which has already lasted for nine months in eastern Ohio and continued about four months in other districts, little violence on the part of the strikers took place. Some controversy occurred in certain parts of Belmont and Jefferson Counties over the employment of engineers and pumpers to keep the mines free from water. Several mobs were formed and in a number of cases duress was used to have the pumps abandoned. The Ohio mine department immediately got busy and after calling the men together explained the consequences of their action. With the jailing of a number of the agitators of the Industrial Workers of the World, the violence ceased. On the other hand, operators did not give the miners any cause for violence as they did not make any attempt to operate their mines with strike breakers, so called.

From the retail standpoint the year was not as bad as might be expected when the business depression is taken into consideration. The small dealers have been able to buy their coal cheaper than usual and have also been able to sell for about the same quotations as in previous years. This was especially true during the months of July and August when Ohio was flooded with cheap West Virginia coal and dealers took advantage of the low prices. Dealers have also changed their methods of doing business to a large degree. Instead of tying up with contracts they have been buying on the open market with fairly good results.

THE LAKE TRADE WAS POOR

The lake trade in Ohio was about half or even less than half that of the previous year. There were two causes for this falling off in tonnage. One was the long suspension in the Hocking Valley and the total suspension in eastern Ohio which is one of the large districts sharing in the lake trade. Only the larger operators in the Hocking Valley made any effort to ship lake coal and when they got into the game, boats had been chartered by other companies and additional bottoms were rather difficult to secure. Then again the docks of the Northwest became congested toward the latter part of the season and there was a marked falling off in lake tonnage in the latter part of October and during November. One of the larger Ohio companies which has been shipping a million and a quarter tons to the lakes only shipped about 400,000 and another had a falling off of over 50 per cent.

The steam trade was fairly active early in the year and was one of the large factors in making business good previous to the suspension. But these users accumulated such stocks at that time that they were not forced to enter the market until prices became demoralized and much of the buying since has been on the open market. Some of the steam contracts which expired during the year were renewed at the same figures as prevailed in that preceding. The depression in manufacturing lessened the demand for steam grades and to make matters worse railroad-fuel business was not as active as formerly. Taking it all in all the steam business has been bad.

FUTURE PROSPECTS

As to the prospects for the future it is a difficult matter to predict. Many coal men profess to see good business in war orders which are being received. But it is pointed out that many of these are for goods which can be manufactured without any great consumption of fuel. Furthermore, since the steel mills are rather quiet it will require some activity in iron and steel orders before any great benefit to the steam business can be counted on to a certainty.

One of the best features is the fact that coal is being used more and more as a fuel for heating dwellings. Natural gas has failed in extreme cold spells and many of the householders have learned their lessons. Practically all of the dwellings being erected at this time provide for heating by means of coal furnaces.

⁂

Oregon

Only six mines were in operation in Coos County, Oregon, during the past year and the output was light because the Southern Pacific Co. and C. A. Smith Co. concentrated their efforts on extensive development work in preparation for a large output on the completion of the Southern Pacific R.R. to Willamette Valley, where a good market for the coal will be afforded. Only 55,000 tons were produced in Coos County and this tonnage is the lowest in years. The three largest mines are ready to multiply the output many times next year.

There are no mines or deposits worthy of mention in Oregon outside of Coos County, so the output of that area is practically the same as that of the state. Coos County has 450 sq.mi. of coal land.

⁂

Pennsylvania

BY FRANK HALL*

SYNOPSIS—The tonnage in the bituminous region fell 15 per cent. last year, but in the anthracite region hardly any change was noted. The accident rate in the bituminous mines has been low, not a single accident occurring in which more than three men were killed.

The coal production of Pennsylvania for the year 1914 will approximate 225,000,000 net tons, as against 264,000,000 in 1913. Of the total production, 140,000,000 tons will be bituminous and about 85,000,000 tons anthracite.

---

*Deputy chief, Department of Mines, Harrisburg, Penn.

The coal trade, in sympathy with all other industries, suffered somewhat from national legislation and the unsettled conditions produced by the European war. It is difficult to say which of these causes had the greater effect on the production.

Anthracite Production Unaffected by Industrial Depression

As far as the anthracite production is concerned, the untoward influences had little effect, as the estimates for the year indicate a tonnage almost equal to that of 1913. This will be a surprise to many persons, but causes that may affect the bituminous trade have sometimes but little effect on the anthracite. More than this, the almost complete freedom from labor troubles in the latter region during the year permitted of practically uninterrupted operation, and no loss of production therefore resulted from this cause. The excessive drought, however, in some sections of the region interfered to a certain extent with the operations.

Just what effect will be felt in the future from the recent decision of the Public Service Commission in reducing freight rates on anthracite to Philadelphia it is difficult to forecast. The primary result of this action of the commission, as also of all legislative enactments affecting the industries of the country, is to unsettle trade and to a certain extent check its progress until adjustment to the changed conditions is accomplished.

The effect of the war on the bituminous trade has thus far been felt chiefly by the companies that furnish coal for the transatlantic steamers. Possibly the detriment suffered in this way may be more than compensated by increased exports.

No Accident Involving More Than Three Persons in Bituminous Region

The year has been remarkably free from serious accidents, and for the first time in many years the bituminous mines record fewer fatalities than the anthracite region. In fact, in the bituminous mines at no time during the year did an accident occur in which more than three persons were killed, a record almost without a parallel.

On the other hand, in the anthracite region there was a disaster in the 17th district in which six persons were killed by an explosion of gas, one in the 18th district by which six were killed by falling down a shaft, and one in the Third district in which there were 13 fatalities, due to the dropping of the bottom of a cage on which men were descending. It was thought probable that one of the men being lowered accidentally dropped a stick of dynamite, causing an explosion that wrecked the cage. The cause of the accident, however, has not yet been determined. It marred what would have been an unusual record of freedom from casualties in the Third district. Up to the time it occurred there had been only 17 fatal accidents reported, as against 24 in 1913 and 38 in 1912.

The Effect of the Precautionary Rules in the Anthracite Region

The strict enforcement of the mine laws by the Department of Mines and the issuance to the anthracite operators in December, 1913, of additional precautionary rules and suggestions relative to safety have no doubt lessened the dangers of mining operations. The inspectors report that the operators have with general unanimity put the rules and suggestions into practice, notwithstanding that to do so meant in many cases additional cost of operation. The rule requiring two daily inspections of every working place by the mine foreman or assistant mine foreman, in addition to the other inspections made under the law, has demonstrated its efficiency as a protection to the workmen. The other suggestions made at the time relative to accidents by falls, cars, blasts, explosions of gas, electricity and other causes are reported to have added to the safety of mining operations.

There were no serious labor troubles in the state, and strikes and suspensions were not of sufficient magnitude to affect the production in a marked degree. The general opinion among the inspectors and mining men is that the coming year will show increased activity and consequently greater output.

Plants Are Being Fireproofed and Social Changes Are Being Rapidly Made

A distinguishing feature of the coal-mining industry of Pennsylvania at present is the very evident improvement in the character of the buildings and accessories about the collieries and mines. Concrete and steel are rapidly superseding the combustible and more dangerous building materials used in the past.

The first-aid movement grows rapidly and the mines are nearly all provided with equipment and trained corps.

ESTIMATE OF ANTHRACITE PRODUCTION AND PERSONS EMPLOYED IN ANTHRACITE MINES IN 1914

Districts	Production (Net Tons)	Employees, Inside	Employees, Outside
First	2,688,000	4,160	1,550
Second	3,224,256	6,290	1,410
Third	3,673,360	5,922	1,704
Fourth	3,979,209	6,762	1,602
Fifth	4,088,000	5,200	1,500
Sixth	6,149,696	9,267	2,841
Seventh	2,988,720	4,502	925
Eighth	4,230,352	6,425	2,010
Ninth	6,773,916	8,028	2,241
Tenth	5,914,328	8,250	2,427
Eleventh	6,941,289	7,566	4,185
Twelfth	2,742,332	5,465	1,957
Thirteenth	3,371,110	4,164	2,715
Fourteenth	3,360,000	4,166	1,635
Fifteenth	2,867,760	4,641	2,068
Sixteenth	3,396,960	5,318	1,998

South Dakota

By R. L. Daugherty[*]

The only coal so far discovered in South Dakota **is a** low grade of lignite which, at the present time, is only used for domestic purposes. The output is **about 15,000** short tons per annum.

Tennessee

By George E. Sylvester[†]

SYNOPSIS—A decline in production of 15 to 20 per cent. in 1914 evidenced the depression in business which with a high thermometer conspired to keep the mines idle.

The past year has been one of unprecedented dullness in the coal business of Tennessee. The general inactivity of the coal market is partly due to the industrial depression but partly also, it is a result of the open winter of last year which stagnated the market in the early part of the year, and also of the unusually warm weather this fall. This has seriously affected the local market for domestic coal on which many of our mines rely to a large extent.

While exact figures are not available, and an estimate under these conditions is unsatisfactory, I think that there was probably a reduction in this year's output of from 15 to 20 per cent.

The Decline in Business Is Not Likely to Be Permanent

Very few of our mines have been running regularly throughout the year, many having been, for considerable periods, running only a few days a week. There are, however, few mines which have been permanently closed, and there is no reason to believe that the decreased output tends to show any permanent decline in the industry, or that the state will not come back to its normal or an increased output under reasonably favorable conditions.

I consider that the mines have not become less safe and possibly have made some improvement in the last year. The use of permissible explosives is on the increase, most of our mines which would be classed as not at all dangerous using this explosive exclusively. The fatal-accident rate continues about the same and the mines of the state have not suffered from any severe disaster. This year has been free from labor troubles, and there has been little or no complaint of car shortage.

Although there seems to be no organized movement in "welfare" or "mine-safety work" among the operators, there has been much interest among the miners in "first-aid work." To this development the operators have, in most cases, given their hearty coöperation and support, and a successful field day was held in the fall under the management of the Society of Tennessee Mine Foremen.

⁂

Italy produces neither coal nor petroleum, and the Navy Department is thus forced to buy abroad. For years coal has been purchased for the war fleet at Cardiff, Wales, while the oil used has come from the Russian wells. But experts have informed the Italian naval authorities that coal of a better steam-producing quality and a lower rate can be bought in the United States.

Texas

By Isidor J. Broman[*]

SYNOPSIS—Cheap fuel oil and industrial depression prevented the coal industry of Texas from prospering in 1914. The competition of fuel oil is particularly detrimental to the lignite production.

The production of coal in 1914 fell far short of that in the previous year. This was owing to two factors, viz.: The financial depression due to the low price of cotton, and the cheapness of fuel oil, which enabled it to compete seriously with lignite. As a result, the mines have been working only about half full time. The bituminous-coal trade has suffered less, though it also has been reduced by the industrial depression.

Bituminous Coal

I estimate the production of bituminous **coal** for the year to be about a million tons. The mine value of this output will approximate $2,500,000. The bituminous mines are located in Eastland, Maverick, Palo Pinto, Webb, Wise and Young counties. The leading bituminous coal-mining companies are: Texas & Pacific Coal Co.; Thurber; Strawn Coal Mining Co., Strawn; Wise County Coal Co., Bridgeport; Bridgeport Coal Co., Bridgeport; Belknap Coal Co., Newcastle.

The Texas & Pacific Coal Co. operates six mines, employs about 1800 miners and has a maximum daily production of about 2600 tons; the average thickness of the seam is 28 in. The longwall method of mining is used except at the Newcastle mines. Union labor is exclusively employed in the bituminous field. There have been no labor troubles of an aggravated nature during the year.

Lignite

I estimate the production of lignite for the year as approximately 700,000 tons, representing a valuation of about $1,000,000. There are 35 lignite mines scattered over an area approximating 50,000 sq.mi. These mines engage about 1600 men, and none of them employ union labor.

The miners are largely Mexicans, mostly of inferior quality and unsteady in their habits. They form a floating population with no permanent domicile. It is true that were it not for the labor of the negro and Mexican, the lignite industry in this state would, in all probability, be at a standstill. Nevertheless, one great need of the industry is for a more competent and better class of labor. In my estimation, it would decrease the cost of production, add greatly to the length of the lives of the miners and work for efficiency and general safety.

The lignite mines are located in the counties of Bastrip, Hopkins, Lee, Houston, Leon, Medina, Milam, Rains, Robertson, Titus, Van Zandt and Wood. The largest and most productive mines are located in Wood County, and the one having the largest output in Texas produces 1000 tons per day.

The mines in Texas are unusually safe. The fatality rate for the year 1914 will not exceed one fatality for every thousand men employed. This excellent record is due in part to favorable natural conditions and to the control of the mines by operators who, in the main, are zealous in the promotion of safety. At the present time the state employs only one state mine inspector. It is probable that the force will soon be increased.

---

[†] Chief mine inspector, State of Tennessee, Nashville, Tenn.

[*] State mine inspector, Austin, Tex.

The Future of Coal Mining in Texas

It is difficult to make any statement as to the future of the coal-mining industry in this state which would not be considered rash. We have no water power worth mentioning. The state is large but as yet sparsely settled. Its agricultural resources if fully developed could support at least fifty millions of people. It has great promises of industrial growth as well as of increase in population.

Aside from the production of oil, the state has inexhaustible supplies of low-grade, cheap but efficient fuels, and these fuel supplies will supply the power needed by the industries of the state. With the advent of normal industrial conditions and with a gradually increasing knowledge of the value of our fuel resources, and a more efficient use of the fuels that we have, it is easy to see that the coal-mining industry of Texas will prosper in time to come.

Utah

By J. E. Pettit*

SYNOPSIS—Production in 1914 decreases 138,774 tons. Coke increases. There were 20 fatal accidents. Forty-two mining machines now in operation.

The total output for the Utah mines for the fiscal year—Dec. 1, 1913, to Nov. 30, 1914—is 3,149,491 tons, showing a decrease in output from 1913 of 138,774 tons. The output of coke was 348,806 tons or an increase of 34,112 tons. The mines worked approximately 196 days with 4348 men employed. We have experienced no labor troubles during the year, and two new coal properties have commenced shipping, namely, the Cameron Coal Co. and the Standard Coal Co. Two other companies have been organized, namely, the Chrystal Coal Co. and the Ketchum Coal Co.

Our mines have not worked more than two-thirds of full time because of the general depression throughout the country caused by various industrial conditions. The copper mines of Bingham and the smelters in connection have worked but half force and consequently have used only half as much coal as usual. Railroad traffic throughout Utah has been dull, the railroads using approximately 100,000 tons less than last year.

New Tariff Affects Coal Industry

Moreover, the removal of the tariff from the Canadian and Australian coals has displaced much coal in the coast cities and contiguous territories. A total of 173 accidents were reported during the year, 20 of which were fatal and 24 serious. Five of the fatal accidents occurred on the surface, two as the result of a boiler explosion in the power plant of the Spring Canyon Coal Co. Considerable improvements have been made during the year in the mines of the old companies, and thus Utah is prepared to double the output of last year.

Mine Rescue Car No. 2 has made a trip through the various camps of the state and given instructions in first-aid and helmet work, which has been appreciated by all interested. One state contest in first-aid work and two local meets have been held during the past summer. The introduction of electric mining machines in Utah during the past two years has diminished the practice of shooting off the solid, and also encouraged hand mining, with the following results: Coal mined by hand, 1,808,709 tons; mined by machines, 892,541 tons; shot from solid, 448,241 tons. There are 42 mining machines in operation.

Washington

By James Bagley*

SYNOPSIS—Fuel oil is a serious menace to coal industry of Washington. Production decreases in 1914. The majority of accidents in the mines result from the steep inclination of the beds.

Reports received for 11 months of the year indicate a decrease in the coal production of Washington for 1914. With the reports received and an estimate for December, the output for the year will be about 3,000,000 short tons; a decrease of over 850,000 tons, compared with 1913. The output for that year was abnormal, due to the strike in the coal mines of Vancouver Island, in British Columbia, about half a million tons of Washington coal being shipped to the British Columbia market.

Washington is the only state on the Pacific Coast that produces coal in any quantity. The production of coal in Washington has not increased as rapidly as the growth of the Pacific Coast States should warrant. In fact, the figures for 1914 will be about the same as 10 years ago. The production for the year 1914 is not very encouraging to the coal operators of Washington. In the past few years oil has replaced coal as a fuel in many of the manufacturing plants of the Pacific Coast States. Many of the steamers running out of Puget Sound ports are using fuel oil, which can be shipped from California at a very low cost. The railroads are also using large quantities of fuel oil—the Northern Pacific being the only railroad that uses coal exclusively. Electricity is also replacing coal in a great many cases. The natural resources of Washington enable the power companies to generate power at a very low cost to the consumer.

Labor Conditions

No labor troubles of any consequence occurred during the last year, except a few strikes of short duration, which were settled with little loss of time.

The companies working under agreement with the United Mine Workers of America renewed their contract, which expired on Sept. 1, 1914. This agreement holds for two years and is practically the same as the one it succeeds. This insures industrial peace in the coal mines of the state during the life of the agreement.

Fatalities

Seventeen fatal accidents had occurred up to Dec. 19, against 22 for the previous year. Coal mining in Washington is a more hazardous occupation than in most of the Eastern and Central States, on account of the steep inclination of the beds. The pitch runs from 10 deg. in some parts of the state to 80 deg in some of the mines in King and Pierce counties. Accidents due to the pitch average about one-third of the total.

*Chief inspector for State of Utah, Salt Lake City, Utah.

*State coal mine inspector, Seattle, Wash.

West Virginia

By Earl A. Henry*

SYNOPSIS—The depression in business which made sweeping reductions in the production of other states merely retarded the growth of West Virginia. The tonnage produced will probably show a small increase over last year despite the strikes in the central coal field. The output was about 72,800,000 short tons.

The output of coal for the calendar year just past will total about 72,800,000 short tons. The coke produced will be about 1,600,000 tons. About 1,344,000 short tons of coal were used in the operation of the mines; 896,000 tons were furnished to local trade and to tenants and 3,136,000 were used in coke ovens. About 67,200,000 were shipped from the mines and only 10 per cent. of this coal was consigned to points within the state.

Machines Mine about 54 per Cent.

Of the whole production, about 33,600,000 tons were produced by pick-mining, at which roughly 20,000 persons were employed. The other 39,200,000 tons were mined by machine by 22,300 miners and 4300 machine runners and helpers. There were 18,300 other inside employees and 11,200 outside men exclusive of those employed around the coke ovens. These latter were tended by 1900 employees.

Excluding Supervisional Force, Output Is 933 Tons per Man per Annum

In all, 78,000 men were employed in and around the mines of the state exclusive of foremen, office employees, store clerks, etc. Of these, 29,000 were foreigners and 49,000, Americans. About 10,000 acres of coal land were exhausted during the year. Roughly, 5500 mules were employed for haulage, 1000 horses and 1700 locomotives. Of these latter, 1600 were operated by electricity, 40 by air, 25 by gasoline and 50 by steam. There were about 600 generators in use and practically 1300 boilers.

Permissible Powder 22 per Cent. of All Explosives Used

From the figures rendered available by the companies' reports, there were 535,000 kegs of black blasting powder used and 3,800,000 lb. of permissible explosives; 297,300 kegs of powder and 1,400,000 lb. of permissibles being used in pick mining, while 237,700 kegs of powder and 2,400,000 lb. of permissibles were used in machine mining.

The tonnage for the past year has been reduced by about a million and a half gross tons on account of the strike which occurred in District No. 17 beginning June 1 and ending July 14, also by about one-half million tons by strikes reported in other sections of the state.

There is, at the present time, sufficient development for an annual production of 100,000,000 gross tons from mines now in operation and the reports indicate that there are at least 100 mines closed on account of the depression in business, also, that at least 75 more are in the early stages of development and will be able to produce a considerable tonnage within the next year.

During the last year there have been about 20 new fans installed, 30 new tipples constructed, 600 new mine cars purchased, 30 new locomotives installed and 400 new dwellings built.

Coke Production Faces Steady Decline

The production of coke for the last year shows a decrease of practically 1,000,000 net tons, and, owing to the many modern changes in coke production, also the many conditions adverse to its production in this state, still further decrease is expected in this production in the next year, as only about 40 new ovens were constructed last year while about 300 have been abandoned.

These figures, of course, are not final but are based on information available at this time. They are, however, reasonably accurate, but the changes to be made when final reports are obtained will be immaterial.

---

*Chief of West Virginia Department of Mines, Charleston, W. Va.

⁂

Coal and Coke Production in the United States During 1914

The following tables have been compiled largely from data communicated by the various state mine inspectors, estimates having been made only where no such statistics were available, but in all cases upon the basis of reliable information.

PRODUCTION OF COAL IN THE UNITED STATES

States	1913 Short Tons	1914 Short Tons
Bituminous		
Alabama	17,885,000	(*e*) 16,140,000
Alaska	2,500	3,000
Arkansas	(*a*) 2,234,107	(*b*) 2,136,783
Colorado	9,268,939	8,159,489
Idaho	2,000	2,000
Illinois	(*a*) 61,618,744	59,500,000

Canadian Coal Production

British Columbia

By E. J. Jacobs*

SYNOPSIS—Production decreased nearly one-half million tons. However, a number of old mines were improved and new properties opened. Fuel oil a serious competitor.

In 1913, labor troubles at Vancouver Island collieries prevented the total production of coal in British Columbia from being normal; in 1914 the effects of the European war are seen in decreased output of coal from mines on Vancouver Island, also in the Crowsnest district, Southeast Kootenay, while in Nicola district less coal was mined, owing to the change from coal to oil for fuel on the Canadian Pacific Ry. Co.'s main western lines.

The decreases in production of individual districts may be seen by comparing the figures for 1913 with those shown in the 1914 table below. The gross production in East Kootenay in 1913 was 1,491,332 short tons; in Nicola and Similkameen, 297,407 tons; and on Vancouver Island 1,090,312 tons; total gross output, 2,879,251 short tons, as compared with 2,434,387 short tons in 1914. The loss in quantity of gross production of coal was, therefore, 444,864 short tons.

The districts in which coal was mined, and the proportions of production of the various companies, are shown in the following table:

PRODUCTION OF COAL IN 1914

	Short Tons
Vancouver Island:	
Canadian Collieries (Dunsmuir), Ltd	596,976
Pacific Coast Coal Mines, Ltd	137,678
Vancouver-Nanaimo Coal Mining Co., Ltd	118,734
Western Fuel Co	339,314
Total	1,192,702
Nicola:	
Inland Coal & Coke Co., Ltd	62,720
Middlesboro Collieries, Ltd	67,200
Pacific Coast Colliery Co	560
Total	130,480
Similkameen:	
Coalmont Colliery	4,480
Princeton Coal & Land Co., Ltd	17,517
Total	21,997
Southeast Kootenay:	
Corbin Coal & Coke Co., Ltd	83,138
Hosmer Mines, Ltd	132,336
Crow's Nest Pass Coal Co., Ltd	873,734
Total	1,089,208
Gross production of coal	2,434,387
Made into coke	393,502
Total production, net	2,040,885

The production in December having to be estimated, there will be some changes from the foregoing figures, but the differences the revised returns will make will be quite unimportant.

Output of Coke

The quantity of coke made in 1914 is estimated at 266,483 short tons, of which 227,016 short tons was from the ovens of the Crow's Nest Pass Coal Co. and 39,467 tons from those of the Hosmer Mines, Ltd. This total output of 266,483 short tons compares with 319,323 short tons in 1913, which latter was a record year for coke-making in the province. With the exception of 1911, when labor troubles prevented production during the greater part of that year, the output for 1914 was the smallest of any year since 1906. However, an early increase in the quantity made is looked for, renewed demands for coke having led to the restarting of 100 of the Crow's Nest Pass Co.'s ovens at Michel, about the middle of December, with a prospect of still more being in use ere long.

Vancouver Island Collieries

The strike of miners employed at the several collieries on Vancouver Island, declared by the United Mine Workers of America May 1, 1913, was continued during the greater part of 1914, but meanwhile the mine owners obtained all the men they required to operate their mines, so that when the U. M. W. of A. eventually called off the strike, the production of coal was as large as market conditions called for.

The War Affects Demand

Unfortunately, less coal was required for bunkering purposes, for, as already intimated, war conditions unfavorably affected the demand for it. The activity of German cruisers that sought to destroy the shipping of the allied powers at war with Germany, for a period of four months interfered with the steamship trade, to which Vancouver Island collieries usually look for a considerable portion of their market. In December, this interference was removed by the destruction of those of the enemy's warships that had been instrumental in disturbing the mercantile service in the Pacific Ocean of Great Britain and her allies. Again, the competition of fuel oil was felt in some measure, though not in very much larger degree than in 1913.

Canadian Collieries (Dunsmuir), Ltd.

There is little that is new to tell of in connection with the Comox mines (also known as the Cumberland mines) of the Canadian Collieries, Ltd., at some of which important changes, in the substitution of electric power for steam, were made in 1913, while new equipment was added, and underground development was done. Work was stopped at the new mine known as No. 8. The improvement and extension of the standard-gage railway connecting the mines with the shipping docks at Union Bay were completed, and generally adequate provision was made for a considerably enlarged output. All through the year more miners were available than there was full-time employment for, so the labor question did not lessen production, for all the coal that could be sold was produced.

For a while there seemed to be a probability of the company's coke ovens at Union Bay being used again, after having been idle for several years, but the negotiations with a copper-mining and smelting company operating in the coast district were not brought to a successful issue before the close of the year, though not yet broken off.

At this company's Extension colliery, situated southwest of Nanaimo, good progress was made during the year. New electric locomotives were obtained to replace those destroyed by fire during the strike, and new surface buildings were erected. Good work was also done underground, so that the mines of this colliery were restored to normal productivity. The producing capacity of this colliery is now fully 1000 tons a day, as compared with 250 to 300 tons last year.

---

*P. O. Box 645, Victoria, British Columbia.

Western Fuel Co.

Considering conditions in the early part of the year, an excellent showing was made by the Western Fuel Co.'s No. 1 mine, Esplanade, Nanaimo, which was the only one of the company's group of mines that coal was mined from in 1914. The company's Northfield (Brechin) mine was idle throughout the year; it is possible this mine may be permanently abandoned.

At the company's Reserve mine, situated three or four miles south of Nanaimo, two shafts each 10x26 ft. inside of timbers, 350 ft. apart and sunk to a depth of about 1000 ft., sinking of which was commenced in April, 1910, were completed, and tunnels of about 200 ft. in length were driven back to the coal seam. The ventilation system has been completed, and the work of making a connecting heading in the coal has been undertaken. The coal where cut showed 14 ft. thick and is clean, firm and of good quality. The surface plant here, as well as the underground installation, will be modern in every respect. The company contemplates opening another mine in the district after the improvements at the Reserve mine shall have been completed.

Pacific Coast Coal Mines

At the South Wellington mines of the Pacific Coast Coal Mines, Ltd., operations were also resumed months before the calling off of the strike. There was little worthy of particular notice at this company's Fiddick colliery, but at its Morden mine, situated two miles east of South Wellington, at which two shafts were sunk in 1912 and 1913, a reinforced-concrete and steel tipple was constructed, modern machinery installed, and the pithead generally completed along uptodate lines. An 8-ft. seam of coal, reached at 600 ft. depth, is being opened here. At the company's Suquash mine, in the northern part of Vancouver Island, completion of a new shaft and slopes to connect with older workings was resumed after interruption by the strike, beside which the requisite plant and machinery were put in.

Vancouver-Nanaimo Co.

Little information was obtained relative to operations throughout 1914 at the Vancouver-Nanaimo Coal Mining Co.'s Jingle Pot mine. This mine was worked under an agreement with the U. M. W. of A., and its output was, as shown above, about 118,700 short tons of coal.

Nicola and Similkameen

Two companies operating in Nicola district produced coal on a commercial scale in 1914, namely, the Inland Coal & Coke Co., Ltd., and the Middlesboro Collieries, Ltd. (formerly the Nicola Valley Coal & Coke Co.).

Owing to the competition of foreign fuel oil, which was substituted for coal in several cases, the demand for coal was reduced by nearly one-half, so that instead of an output of about 114,000 long tons each, as was made in 1913, the first mentioned company produced only 56,000 tons and the other 60,000 tons in 1914.

The Inland Co. continued development of its mines, chiefly the further sinking of the main slope, the extension of the levels, and driving a 300-ft. rock tunnel at the 600-ft. level to open No. 5 seam, which there shows 7 ft. of clean coal. This company's property, known as the Coal Hill colliery, is situated west of and about 500 ft. above the Middlesboro colliery.

Slackness of coal trade led to a curtailment of operations by the Middlesboro Collieries, Ltd., so Nos. 2 and 6 mines were idle, mining having been restricted to No. 4 seam, opened in 1913 on the west side of the property and known as No. 7 mine. The coal is about 18 ft. in thickness, with sandstone roof and floor. Present output from here is approximately 300 tons each working day.

In Similkameen district, the Coalmont and the Princeton collieries were operated. At the Coalmont property about 3500 ft. of development work was done. In the spring there were found two seams of coal, of 7 and 5 ft., respectively, with only a small parting between, making practically a 12-ft. seam of coal, giving on analysis, moisture, 4.95; volatile combustible, 35.93; fixed carbon, 49.47; and ash, 9.65. Small additions were made to steam-power and ventilation facilities, and preliminaries for providing transportation to the railway three miles away were taken in hand. Additions were made to both steam and electric equipment. With construction of more railway lines in progress in the neighborhood, the prospects for an increased market for coal are favorable.

Collieries in Southeast Kootenay

Three companies operated, namely, the Crow's Nest Pass Coal Co., Ltd., the Hosmer Mines, Ltd., and the Corbin Coal & Coke Co. There is little to report of the Hosmer colliery, for the reason that last summer it was closed, and it is understood that it has been permanently abandoned by its present owners, who have finally given up work in a country found to be so disturbed as to make profitable mining of the coal out of the question.

Crow's Nest Pass Coal Co.

The considerable decrease in production of coal and coke at this company's collieries, as compared with 1913, is attributed to a general decrease in consumption all over the region in which are its available markets, this having been especially true since the beginning of the war. New work was done, however, and additions made to equipment.

Development work was also carried on in the new B. mine, where a new fan was installed and the mine opened to a producing capacity of about 800 tons of coal a day.

At its Michel colliery, the Crow's Nest Pass Co. developed its new No. 8 mine to a capacity of 600 tons a day, and it redeveloped No. 3 seam on the south side of the valley through the syncline basin faults. Two new seams of coal were discovered on the south side of the valley. Generally, in 1914 the company provided for an increased output of coal to the extent of at least 1000 tons a day more than the physical output of 1913.

Corbin Coal & Coke Co.

Much more surface stripping was done at the Corbin Coal & Coke Co.'s No. 3 mine, also known as the "Big Showing," where, during the part of the year when there is no snow on the mountain, operations are conducted on the opencut or quarry system. A Marcus screen was added to the surface equipment. Production of coal was a little larger than in 1913—74,230 long tons, against 72,788 tons.

General Notes

No important progress was made in the nonproducing coal fields in the province, although more prospecting and exploration of coal measures was done in several of the outlying fields. Until a railway shall be constructed to the Groundhog field, in the northern Skeena country, where the occurrence of anthracite is claimed by owners of coal lands, no effective advance can be made toward its commercial development.

In conclusion, reference may be made to the mine-rescue work. Beside the ample mine-rescue apparatus and men trained in its use that all operating coal-mining companies have provided, as required by provincial law, the Canadian Government has two fully equipped mine-rescue stations in the province, with Draeger mouth-breathing type of apparatus. Efficient men are in charge of these stations, and it is here that training is done to give opportunity to those who take it to qualify for obtaining Government certificates of competency. As well, instruction is given in the use of the pulmotor, and in the St. John Ambulance Association methods of rendering "first aid to the injured."

Nova Scotia

By R. D. Anderson*

SYNOPSIS—Output of coal was about 7,840,000 short tons and the coke production 504,000 short tons in 1914.

The output of coal for last year was about 7,840,000 short tons and the output of coke 504,000 tons. Conditions immediately preceding the war reduced the output.

No new mines were opened during the year, and the collieries are now working about three-quarter full time.

Trade with the New England States will, it is expected, be better than it was last year, as the Dominion Coal Co. has chartered double the number of cargo boats for that trade during the present winter.

The accident list is about the same as last year, there being no great mining disasters.

Coal Mining in Alberta during 1914

By John T. Stirling†

SYNOPSIS—Production decreases about 600.000 tons. New districts being opened. Safety lamps are widely used. One hundred and forty-two men are given first-aid certificates.

During the year 1914, the coal-mining industry in Alberta, particularly in the southern portion of the province, has not been so satisfactory as it was during the year 1913.

There were 4,306,346 tons of coal produced during the year 1913, but the output for the year 1914 will probably not exceed 3,650,000 tons. This falling off is due in a large extent to the reduced amount of coal being used by the railway companies and also to the extremely mild weather which has been experienced throughout the year.

At the end of the year 1913 there were 217 mines in operation, while at present there are only 208. Thirty-seven mines have been abandoned during the present year; 4 were reopened and 24 new mines commenced.

For the last few months, the mines in the Crow's Nest Pass district have only been producing about 30 per cent. of their available output, while the mines in the Lethbridge district have been producing about 50 per cent.

The mines in the northern part of the province have been working somewhat steadily and at the present time are all practically working to full capacity. A considerable improvement has also taken place in the Lethbridge field during the last week or two and it is expected that from now on, for the next few months, the mines in this district will work steadily.

Important Developments

The most important development in the province during the year took place in the Drumheller and Brazeau districts. In the Drumheller district, where the coal mined is of a high grade, there are now eight mines in operation. The output in this district for the year 1913 was 52,894 tons, while for the year 1914, it is estimated that it will be at least double that amount. Most of this coal is shipped to Manitoba and Saskatchewan.

In the Brazeau district, the mines operated by the Brazeau Collieries, Ltd., have been so far developed that an output of 1000 tons per day is now being obtained.

The mines situated on the main transcontinental lines of the Canadian Northern and Grank Trunk Pacific railways, about 200 miles west of Edmonton, are being developed very slowly, owing to the difficulty in getting rid of the output.

Practically all the mines which have been commenced during the year have been opened with the intention of operating on a small scale for the purpose of supplying the immediate local demand. There have been no new mines opened up in the district north of Edmonton.

Most Mines Use Safety Lamps

All the bituminous and anthracite mines in the province are now being operated with safety lamps entirely, as well as the more important lignite mines. All the mines in the Drumheller district are also operated by means of safety lamps. The lamp most commonly in use is of the Wolf type, while some of the Koehler type and also electric safety lamps are being employed.

The No. 6 mine, operated by the Department of Natural Resources of the Canadian Pacific Railway Co., is equipped with electric safety lamps of the Wico and Ceag types, while a number of lamps of the Edison type are being used by the Pembina Coal Co., Ltd. All these lamps are giving satisfaction.

During the past year the Pembina Coal Co.. Ltd., has installed two storage-battery locomotives of the Edison type.

There has been a considerable increase in the number of tons of coal produced per pound of explosive used particularly in the bituminous and anthracite mines and only "permitted explosives" are now allowed to be used in these mines.

Up to the present time, there have been 87 nonfatal accidents and 19 fatal accidents in the province during the year 1914. This number is exclusive of the catastrophe which occurred on June 19, in the mine operated by the Hillcrest Collieries, Ltd., at Hillcrest, whereby 189 men lost their lives. This catastrophe was caused by an explosion of gas and coal dust. It has been impossible, however, to ascertain the cause of the explosion.

---

*Deputy inspector of mines and quarries, Halifax, N. S.

†Chief inspector of mines, Edmonton, Alta., Can.

An order-in-council was passed during the year, putting into effect certain regulations under the Mines Act. These regulations, among other things, prohibit any person, other than an authorized person, relighting a safety lamp underground, and also make provision for the better regulating of the amount of coal dust in a mine.

Training in First Aid

During the year, further training in mine-rescue work has been carried on to such an extent that there are now 142 men holding certificates in the province for this work. A second railway car has been provided and equipped for rescue service and instruction in the Bankhead and Canmore districts. In addition to this, there is a mine-rescue car in the Crow's Nest Pass district, which operates between Lundbreck and Coleman. A mine-rescue station is also being operated at Hardieville, near Lethbridge, and substations at Commerce, Coalhurst and Taber.

The Provincial Government has organized classes in technical education at the different mining camps in the province, and while these classes are only just commencing at present, it is expected that a large attendance will be obtained.

❋ ❋

Coal Markets and Business Aspects of the Fuel Industry in 1914

By A. T. Shurick

SYNOPSIS—The year has been a generally unsatisfactory one in every respect for the operators. A notable dullness marked the early part of the period, due to the generally adverse interpretation placed upon the drastic legislation, both national and state. This situation was accentuated to an acute degree by the European war, with the result that the last half brought about even more distressing conditions. Production for the year has shown a heavy decline. In labor circles there was a general uneasiness supplemented in a few instances by determined fights between the unions and capital. In general, the period has been one of uniform recessions marked by aggressive retrenchment policies in all directions.

While the year 1914 opened under moderately auspicious conditions, this soon gave way to a disappointing dullness, and the last half found the commercial world grappling with the most tremendous demoralization in history. That the gun was loaded, we have all vaguely understood; but that the trigger would ever be pulled we had never seriously considered. Falling thus as a distinct surprise, the shock could not have been more severe. Our threatened entanglement in Mexico, the Colorado strike with its accompanying spectacular demonstrations extending from coast to coast, and the failure of several powerful banking and commercial institutions, were all dwarfed into insignificance.

But that we still have much cause for self-congratulation, even in the midst of all this disarray, is an important compensation for us. Our losses, sacrifices and sufferings have been insignificant as compared with Europe; and while these warring states are steadily weakening, the potential strength of this country is increasing in a like proportion so that we may ultimately occupy a position in the world's business and commercial affairs perhaps never dreamed of.

One of the most impelling constructive developments of the year was the general abatement in destructive legislation, so inimical to the industrial progress of the country. Popular disapproval of these policies was evident in the November election, the defeat of Governor Cox of Ohio forming an example in which the coal industry is more particularly interested, and politicians must soon awake to a realization that such policies cannot be considered as a passport to public favor.

General Conditions

As compared with the previous year, 1914 was generally unsatisfactory in every respect, and a period of pronounced discouragement to both operators and sales agents. Even in the face of a possible suspension at the mines the market began to develop soft spots as early as March which were followed by a persistent and extreme dullness throughout the year. By the middle of summer the selling agents were reporting the situation as one of the dullest in their recollection, and strict curtailment propagandas were put into effect, which for a time gave encouraging hopes of rectifying the trouble. Producers also placed a favorable interpretation upon the European war at first, seeing indications for an immediate expansion of our export business on a tremendous scale with the result that extra supplies were ordered and sales agents showed a marked hesitancy to commit themselves on future negotiations. For a brief time there was a sharp flurry in export business, but through it all consumers showed every confidence in being able to obtain adequate supplies and when the fallacy of expecting any important relief in this direction was finally and definitely disposed of, hopes of any improvement were abandoned by even the most optimistic. The placing of the New Haven contract, involving a quarter of a million tons, with Cape Breton interests for shipments in English vessels further accentuated the depression in the New England district.

Though the close of the year brought many rumors of industrial improvement and resumption in manufacturing districts, it is becoming more and more evident that the process will be slow. And in view of the weak prices ruling through most of the period, it is clear that consumers will be conservative as regards negotiations on new contracts. The one predominating condition that has been brought sharply home to the coal industry during the year is how completely dependent it is upon the general prosperity of the country at large.

Financial

The adverse conditions prevailing in the world's money markets have exerted such an impelling influence upon the coal business that this subject seems to justify more than cursory examination. Never before in history have the effects of a panic been so keenly felt; not that previous depressions or decisive wars have failed to create equally acute conditions, but business has expanded so tremendously and the commercial machinery of the world is today so closely interlocked, with each unit dependent upon the others that the abrupt disruption of this condition could not but create a situation that would extend to the remotest parts of the world.

One of the first developments immediately following the various declarations of war was the establishment of moratoria on the part of nearly all the involved states. Perhaps the most amazing feature of this was the disposition on the part of the European countries to shift the blame for this demoralization onto the United States—a responsibility which, strange to say, appears to have been generally accepted in this country. The statement was repeatedly made that we were unable to meet our maturing obligations when, as a matter of fact, it was the Europeans themselves who suspended payment of all indebtedness, a condition which was not at any time considered in this country.

The effects of these moratoria in this country were, of course, enormous, particularly as regards England. As is well known, London is the chief clearing house of the world; not only was she responsible for her own indebtedness to us, but practically all of our foreign and export business the world over is cleared through the London banks. The British moratorium, originally declared for 30 days only, ran over a period of three months before it was finally lifted, and during this time it is estimated that our exports, for which payment was held up in London, aggregated nearly half a billion dollars.

The close of the year found a distinctly improved sentiment prevailing in business circles—improved, that is, as compared with conditions immediately succeeding the European war. The very unexpectedness of the war alone was sufficient to cause a more or less complete collapse of the world's financial machinery; particularly was this the case in this country which had been struggling along for a long period under the burden of what the large business interests chose to interpret as adverse legislation. Considering these conditions, therefore, the renewed optimism at the end of the year is even more gratifying.

Certainly the first shock of the war was succeeded by a wonderfully effective constructive propaganda. Exchange, commerce and credit, problems requiring immediate solution, were hastily patched up with temporary expedients and later reëstablished on a permanent basis. Restrictions were slowly removed, the exchanges gradually getting under way during the last month, and investment and speculation resumed, though on a much reduced scale. There is a growing conviction among conservative observers that, with the bottom of the depression now past, the recovery should continue even though the war still exists.

The President's Message

The reassuring statements in the President's last message toward the close of the year, such as "The road at last lies clear and firm before business, the road to ungrudged and unclouded success," lacks nothing of the customary beautiful phraseology, though the practical business man would no doubt prefer something more tangible. The one ameliorating condition in the message seems to lie in his assurances that the drastic legislation had been concluded, for the time being at least.

Mr. Wilson also reminds us that the foreign wars have created unexpected and unprecedented opportunities for American manufacturers, but his query: "How are we to carry our goods to the empty markets of which I have spoken if we have not the ships?" seems hardly justified. Certainly where profitable investments offering reasonable security can be obtained there should be plenty of private capital available, and if the investment is not profitable, it is illogical to expect or desire that the Government should participate in it.

In general, the present administration has not favorably impressed the country, particularly the mining industry. It is now thought that what is required more than anything else is a government that will adhere more particularly to governing, and cease interfering with the normal course of business. Mr. Wilson is a serious man and there are few that will question his sincerity, but his position on some of the leading questions of the day, as for instance the labor problem, is the cause of no little uneasiness.

Transportation Statistics

A study of the performance of the principal coal carriers throws interesting light on the progress of the coal industry through the year. Almost without exception these roads show a consistent loss throughout most of the year, and in no important case is the customary 10 per cent. increase in tonnage noted.

Anthracite Shipments—The hard-coal tonnage for the first eleven months showed a decline of more than three-quarters of a million tons. There was considerable activity in anthracite over the last month of the year, due to more or less continuous cold weather; this will cause a substantial increase in shipments over that for December, 1913, which were relatively light, and the final loss in anthracite shipments will not exceed half a million tons.

The Thirteen Leading Coal Roads—Of the many railroad statistics, this government compilation, showing the monthly results on the thirteen leading bituminous coal roads, is by far the most comprehensive statement of this kind there is. Unfortunately, it is considerably delayed in publication; but it covers, perhaps, 40 per cent. of the aggregate bituminous tonnage in the country and hence forms a valuable criterion of the situation. The accompanying table shows the report for October and the first ten months of 1914, the latest report available at this time.

It will be noted that the gross tonnage for the ten-month period shows a loss of nearly 12 million tons for 1914, as compared with 1913. This falling off may seem unimportant as compared with the gross tonnage involved, but it should be remembered that in periods of normal progress there is an average increase of ten per cent. per annum in the tonnage; an actual falling off below the previous records is, therefore, a matter of some concern. During only one month did the 1914 tonnage exceed that of last year; this was in March and was due entirely to anticipation of a more or less protracted suspension pending the arranging of a new wage scale, the consumers pushing rather aggressively for deliveries.

Bituminous Coal Movement—The following is a summary of the movement of coal and coke over 13 principal railroads during October and the first ten months of the last two years, in short tons:

	October		10 Months	
Anthracite	1913	1914	1913	1914
Baltimore & Ohio[1]	166,214	127,374	1,226,938	1,118,554

[1] Includes coal received from connecting lines.

[2] Includes company's coal.

[3] Does not include company's coal hauled free.

Note:—The Southern Railway hauled 349,160 short tons of bituminous coal during September, 1914, and 2,965,474 short tons during the nine months ending Sept. 30, 1914.

The Pennsylvania R.R.—The Pennsylvania R.R., with its gross tonnage of 70 million tons of soft coal per annum, was a full 6 million tons behind the movement of last year at the end of the first eleven months.

The Sault Ste. Marie Canal—The coal tonnage through the Sault Ste. Marie Canal fell off 4 million tons, or more than 20 per cent. below the movement last year. This was due to the light demand during the winter of 1913-14, which left heavy stocks at the Upper Lake ports.

ANTHRACITE

The salient feature of the anthracite trade in 1914 was the obviously heavy stocks available at all times throughout practically the whole year. All the enormous storage facilities of the large companies, as well as the yards of the smaller individuals were taxed to their utmost to carry the large surpluses, and at no time was there a general shortage on all sizes.

This rather unusual condition was due for the most part to the unusually mild winter of 1913-14, and consequent light consumption which resulted in large stocks being carried over after the April discount went into effect. Even in the early months of the year, which are commonly regarded as the best of the season for the anthracite trade, an intermittent curtailment of mining operation became necessary, and by the middle of February individual operators had cut the regular circular down to the Apr. 1 basis.

By mid-summer the most rigid curtailment became necessary. The stringency in the money market and the difficulty in obtaining ready cash caused a heavy reduction in the usual summer stocking of domestic coal, consumers preferring to pay the higher winter prices rather than reduce their bank balances under the unfavorable conditions that existed. The depression in industrial circles had a blighting effect on the steam sizes, and the situation on these grades became almost as badly demoralized as bituminous coal. Even the early fall months, which are usually a period of great activity in anthracite circles, failed to show much improvement, and it was not until well into December, after several weeks of unusually severe weather, that the market toned up to any appreciable extent.

Evidence of the exceedingly adverse conditions prevailing in all directions is apparent when one remembers that at scarcely any time during the year were the individuals able to exact their customary premiums from the consumers. Nearly every coal season is marked by certain periods during which substantial advances over the regular circular are obtainable; but this year it is doubtful if many of the individual operators will average up to the full circular on the year's business.

There were no important changes in the gradation or marketing of any of the anthracite sizes. Stove coal during parts of the year was in urgent demand, which fact not infrequently assisted the operator to move the other sizes. It was commonly thought in trade circles that the price might be advantageously increased on this size, and thus divert a portion of the demand to other grades.

WEST VIRGINIA COALS

The opening price on Pocahontas and New River coals at Hampton Roads was $2.85 f.o.b., although $2.75 more nearly represented the actual market. The evident determination on the part of certain agencies to regain lost tonnage was a potent factor in weakening prices and this was further accentuated by the fact that the Hampton Roads yards were congested with heavy excess tonnages throughout the entire period. There has seldom ever been such a complete absence of spot business while contractors were generally forced to protect the consumers against a decline. The market was obviously distressed to absorb even the curtailed production then in effect and what few orders for prompt shipment did come in were always filled with the greatest dispatch.

When the large consumers began to make heavy cuts on their contracts, the operators failed to meet this with a like restriction in production and the market became so glutted with coal that no further pretense of maintaining the $2.85 basis was made. Finally, when $2.50 became readily obtainable and buyers failed to respond even at this low figure, severe restrictive measures were forced upon the operators; this, together with the prospects of a lucrative export business, which appeared early in August, caused a temporary stimulation.

The situation was indeterminate for a short period and prices stiffened up, but when nothing tangible developed in the export trade there was another relapse to the $2.50 level on which still further cuts would have been made only that sales agents were convinced of the futility of any such move. The general softness of the market toward the year end, as evidenced by the closing of a large power-house contract on a $2.70 basis, shows a distinctly adverse outlook for the new year.

The desperate plight of the Pocahontas and New River shippers forced them to guarantee low water rates to the New England trade by which they were, for a time, able to supplement a considerable amount of the higher grade Georges Creek tonnage, and though the latter soon met these new delivered prices and regained a portion of this business, the West Virginia coal still retained a substantial part of it.

The Georges Creek coals, as usual, were very closely held and seldom loaded except on firm orders. The anticipated boom in export business created more or less of an acute situation on these coals for a short time, the operators in that district having been long interested in building up a foreign trade.

A striking effect of the European war was the abrupt cessation of operations on the part of the Berwind-White Co. This concern being one of the most favorably situated coal producers in the country, as regards the marketing of its product, has scarcely ever been compelled to seriously restrict operations even in the face of the most severe depression, but with German shipping driven off the seas, the first month of the war found this company working at less than half capacity.

It should be remembered that the Berwind-White Co. is practically in control of all the bunkering business in New York Harbor, and is said to be closely affiliated with the German lines particularly; in fact, there were well defined rumors current that considerable of this company's coal found its way into the German cruisers in Southern waters. The most significant feature of interest in this connection, however, is the fact that a disposal for this large surplus tonnage must be found, and the New York agencies are anticipating an aggressive competition on new business from this company.

NEW YORK

In the Eastern bituminous market the opening of the year found operators generally reluctant to quote on the new contracts, partially because of the expectations of a general revival in business, but more particularly because it was thought there would be a heavy stocking movement in anticipation of a prolonged suspension when the wage agreement expired Apr. 1. But when this time arrived the miners apparently realized the hopelessness of their position, with the result that agreements were quickly effected in most districts shipping the Eastern market.

In the meantime some stocking had been done through March, which was the only month in which there was any activity of any kind. This left the consumers with large surpluses on hand, so that the market was poorly equipped to withstand the succession of adverse conditions, both legislative and commercial, which developed during the first half of the year. It was well into July before the situation showed any indication of clearing up, and this was, of course, immediately reversed with the declaration of war in Europe.

Heavy restrictions in general manufacturing went rapidly into effect, the results of which became more and more apparent in the coal industry. The only ameliorating condition in the whole situation at this time was a spurt of activity in the export business, although this was more in shape of irregular trade and failed utterly to relieve the pressure on the general market; as a matter of fact the August exports from this country showed a severe slump of about 20 per cent. as compared with the same month last year.

There has seldom ever been a year so completely discouraging to the Eastern bituminous trade as 1914. The coal agencies were compelled to canvass aggressively for business throughout nearly the whole period and competition was at its keenest. But in spite of these adverse conditions, there is one significant and encouraging fact that will do much to cheer the operators as to the future, and that is the obviously determined efforts noted on all sides to obtain higher prices; tangible evidence of this move on any important scale was first noticed in 1913, and it was rigidly adhered to throughout the year just closed. Occasional tonnages on demurrage were, of course, sacrificed, particularly in late April and early May, when it became clear that no protracted suspension in mining would occur, but on regular business concessions on old figures were slight.

Among the features of purely local interest at New York was the severe decline in slack coal as compared with 1913, this being due especially to the curtailment of production at the steel plants and cement works. The high-grade volatile coals were in strong demand throughout the year, and at no time were subject to any heavy cut.

THE PENNSYLVANIA COALS

The superabundance of the West Virginia coals in the New England markets had an exceedingly adverse effect on the Pennsylvania grades in that direction. The higher grade qualities did fairly well but when the Hampton Roads shippers break below their standard $2.85 level, there is little hope for the medium- and low-grade Pennsylvania product. That the Pennsylvania operators are making a determined effort to overcome this difficulty is evident from the much greater care they are exercising in preparation of the coal and also by the increasing complaints regarding the impurities in the West Virginia product.

The second month of the year found such a large excess accumulation of the Pennsylvania varieties at Philadelphia and New York that certain of the transportation lines were forced to declare embargoes. A temporary stimulation occurred when this congestion had been relieved which was fairly well maintained due to the slight flurry preceding the expiration of the old wage agreement, but this was followed by a period of exceeding dullness and frequent reports of demurrage coal. Operators struck their minimum price early in the year and maintained it throughout the period and at no time was there any activity in the market with the possible exception of a fleeting spurt the first of August.

As would naturally be expected in the face of a market such as this, a certain amount of coal was sure to accumulate on demurrage, but it must be said that the Pennsylvania operators were eminently better off in this respect than the West Virginia companies who showed a pronounced disposition to force business on the slightest excuse. The market was not relieved in any way, throughout the year, constant pressure on the trade being the characteristic feature.

THE EXPORT TRADE

American operators anticipated such unlimited possibilities in the export trade when the European war was precipitated that they even went so far as to be conservative about future commitments, in spite of the fact that they were facing one of the most depressed markets in the history of the trade. Prices stiffened up perceptibly, and there were well defined rumors of moderate premiums offered in the offshore trade.

Indeed, a substantial increase might have been experienced in the export business, had it not been that all German and Austrian shipping was abruptly interned, while the English government was reported to have chartered 1500 steamers, with the result that there was a runaway market in ocean freights, the situation finally culminating with rates entirely prohibitive for coal shipping. The difficulty in making proper financial arrangements also accentuated the trouble, South American merchants demanding credit extending over two to four months, and frequently asking renewals at the end of that period.

The Georges Creek shippers, who have always shown a keen interest in the offshore business, entered aggressively into the market, giving preference to foreign loading over their regular coastwise trade. For a few weeks their routine business even suffered, and it was necessary to divert some bottoms to Hampton Roads for loading, but this did not prevail for long.

The early prospects for American operators in the foreign markets were distinctly better during the past year than ever before, several large tonnages having been contracted for in Italy, while the South American trade continued to show a steady increase. The temporary embargo against coal shipments from Great Britain when war was declared diverted a large number of inquiries to America, but the high freight rates and long-term credits caused this business to be regarded with disfavor in most instances, so that there was little closed. After the embargo was raised, this narrowed the market for the American product, and the situation was still less favorable. When the unprecedented advance in vessel rates occurred toward the close of the year, this developed such a tense situation that schooners, which ordinarily operate in the Coastwise trade only, entered into the export business.

One of the significant developments in this trade during the year was the completion of two of the largest coal piers in the world at Hampton Roads, which will add materially to our exporting capacity. It is also interesting to note that the Government has undertaken to facilitate this branch of our foreign business by directing the efforts of the Government's technical staffs to the assistance of American coal exporters.

Close observers believe that the American companies will gain a strong foothold in the foreign markets before Great Britain is again in a position to properly care for her interests in this direction. It is also thought that even when the war has ceased it is more than possible that England will never again dominate the world's coal markets as she has in the past, but will more likely endeavor to conserve her already depleted reserves.

The opening of the Panama Canal was another important development of the year but it has been in operation over too short a period to draw any conclusions on the ultimate results. There have, nevertheless, been a number of significant changes in this direction.

On the whole, the year has been a most important one for American coal exporters for the reason that it has taught them much regarding the foreign markets, the competitive coals and the methods under which they will be expected to do business. When war was first declared there was a rush of American sales agents to the Southern markets in unprecedented numbers, and, although their reports on the situation were more or less uniformly discouraging, they have gained a knowledge and insight into existing conditions which will be invaluable in the years to come. It is clear to all that American exporters could have materially increased their tonnage had they been willing to meet certain conditions as to credits, etc.

Connellsville Coke

In the Connellsville coke region we find particular evidence of the acute depression. The output for the year was only 13 million tons, the smallest since 1904, with the single exception of 1908, the year immediately following the panic of 1907. Prices were also at a low ebb; in fact, they were so generally unprofitable that many of the properties acquired at the high figures prevailing on Connellsville coke lands, in late years, were compelled to suspend operations.

Consumers as a rule showed a disposition to buy in the spot market, and no doubt they were able to fill their requirements at figures substantially less than contracts were bringing. It is a notable fact, however, that quotations in the prompt market were at a somewhat higher level than in other years, though this is in a measure offset by the higher wage scales now in effect.

The Lake Markets

In sharp contrast with the year 1913, the past twelve months have undoubtedly been one of the worst periods in the history of the Pittsburgh district, both as regards prices and production. The Lake demand was altogether unsatisfactory, while the steel mills did not operate on an average of 60 per cent. during the year, and the railroad consumption was heavily curtailed. One of the chief causes for this condition lay in the settlement of the biannual wage scale; there is invariably a heavy stocking movement against the possibility of a long suspension, and the cleaning up of these surpluses often drags out over a long time, particularly when consumption is light as has been the case during this year.

The Lake trade opened quite inauspiciously, and the movement was consistently below previous records throughout the entire season in spite of the fact that shippers continued optimistic for a better business during the whole period.

The open winter of 1913-14 left heavy stocks on the Upper Lake ports so that the past season opened with prices 10 to 15c. below those for the previous year. In fact, supplies were so excessive that there was no anxiety whatever over the possibility of a long suspension in the central competitive district. About a half million tons of coal had been loaded on vessels during the winter, most of which was not required until late in the season as is evident by the fact that one cargo of Hocking coal, loaded during the winter, was not delivered until late in October. The movement to Lake Superior only touched the two million-ton mark one month during the season, although this was a common average during the previous year. The gross tonnage for the year was nearly a fourth less than in 1913 and conditions have seldom been worse. The heaviest loser was, of course, Ohio; computed on the basis of past performances, Ohio should have shipped 4¾ million tons, one-half of which would have come from the No. 8 field, which was closed down throughout the entire season.

There is no doubt that the mine-run law has seriously affected the value of the Ohio screenings; there is not only a larger percentage made, but they are of such inferior quality that consumers can seldom be prevailed upon to accept them when any others are available. Experienced and conservative sales agents estimate that Ohio screenings are now worth 85 to 90 per cent. what they previously brought under the old law

THE MISSISSIPPI VALLEY

The winter of 1913-14 was so exceptionally mild that the domestic business in the Middle West seemed to grow steadily worse through the opening months of the year, though a little spurt was evident immediately preceding the expiration of the old wage agreement when there seemed to be possibilities of a more or less protracted suspension of mining. The fact that the cessation was not of sufficient duration to clean up the accumulated surpluses proved a serious blow to the market. With the large supplies thus left over, and the disposition among consumers to refrain from doing their usual summer stocking for the ensuing winter, the market continued to drag heavily throughout the summer months. Though operators maintained an optimistic attitude during most of the year, it cannot be regarded as other than a most unsatisfactory period.

Anthracite shipments to this district have been substantially reduced, due probably to an extensive advertising campaign by the gas-house coke producers. The business this year was particularly poor, prices ruling most of the time substantially below the circular and the demand light.

The operators in the southern Illinois field found their market still further curtailed, due principally to the continually advancing wage scale. In fact, this section experienced a disappointment in all directions, as is evidenced by the fact that nine mines out of a total of 34 in the Williamson County field, were idle through practically the whole of the year. Another development which promises to create important complications in the Illinois district is coöperative mining. The move is proving a menace both to the legitimate operators and the miners' organization, and, unless some determined efforts are made to stamp it out, it may shortly become one of the serious problems of the local coal industry.

The year 1914 will long be remembered as one of severe stress and keen disappointments. But we enter the new period with a distinctly optimistic feeling in all quarters, much encouraged by the success that we have had in coping with the difficulties of the past 12 months.

Coal Receipts by Water at the Port of Boston

The accompanying tables show total coal receipts at Boston, furnished by courtesy of the Boston Chamber of Commerce. Anthracite shipments made a slight increase over last year, but the bituminous arrivals were substantially less. This is the first instance of a decrease in the soft-coal arrivals for a number of years.

* Courtesy of the Boston Chamber of Commerce, Statistics Department.

[1] Includes small shipments from Washington and Georgetown, D. C. [2] Lamberts Point and Sewalls Point. [3] Almost exclusively from Louisburg, Cape Breton, except during 1903 when a large tonnage came from Great Britain to relieve shortage because of strike.

※

British Honduras as a Coal Market

British Honduras offers a limited market for coal, says the *Daily Consular and Trade Reports.* The trade for the last four years has been about equally divided between England and the United States. The following table shows the value and origin of the imports:

	From United Kingdom		From United States	
Year	Tons	Value	Tons	Value
1910......................	772.5	$4,235	2,008	$8,960
1911......................	2,877.5	18,102	680	4,123
1912......................	2,272.0	12,244	1,400	10,122
1913......................	1,552.5	10,813	1,180	8,178

There is no duty on coal. The amount of coke imported is less than a ton a year.

It would appear that in view of the amount of coal from England there would be an opportunity for a further advance in the sale of the American product. The chief consumer of the Welsh coal is the Stann Creek Ry., a short line, Government owned, with its tidewater terminus at Stann Creek, the second largest town in the colony. It is directed by a superintendent whose headquarters are at Stann Creek.

※

With a given fuel, there is a proper thickness of fire and a certain definite draft needed for every load on a boiler. These thicknesses and drafts should be determined experimentally and the requirements indicated should be closely followed.—Bromley in "Power."

Marketing and Shipping Conditions on the Atlantic Coast in 1914

By G. G. Wolkins

SYNOPSIS—The year just ended was peculiarly unsatisfactory for most of the bituminous interests. In Pocahontas and New River there was depression throughout, with poor industrial conditions and an over-production of coal the chief elements. Export trade was especially disappointing, failing when it was most needed. Georges Creek coals were uniform as to price and consistent as to output but the Pennsylvania grades suffered from the large output in West Virginia. Water freights reached the lowest level in years. Anthracite shipments increased and that trade enjoyed a generally satisfactory year.

The year 1914 fell far short of the satisfactory record that distinguished the preceding twelve months. It ended as it began, in a slow inactive market for all varieties, with over-production and low prices in bituminous consistently the chief factors all through the year, and relieved only by one or two short periods of "prospects"—periods that became in fact the despair of operators and selling agents. The slack industrial situation combined with other conditions to make 1914 a colorless and mediocre season in the coastwise coal trade.

Partial Pennsylvania Suspension

There are few features that stand out in a review of conditions during a year in which coal was so sluggish. The long-heralded suspension of mining in central Pennsylvania had actually very little effect on the tide-water market. So long as there was a pronounced surplus of Southern coals it mattered little to New England if every bituminous operation in Pennsylvania should shut down. Stocks were large, and a controversy over weighing and checkoff was not serious enough to cause apprehension in so dull a market. The "suspension" showed its less serious side when in many instances mine workers on good terms with their employers were accommodating enough to cut coal for such orders as seemed urgent and then resumed the "suspension." A large number of the mines affected would have closed down for most of the time anyway, purely through lack of business. Differences were gradually adjusted and no more was heard of labor troubles the rest of the year.

Possibility of an increase in tolls was an uncertain element, especially in the spring when contracts were being made, but the much postponed decision late in the year finally disposed of the matter. New England was interested because a percentage advance would have been adverse to all-rail delivery and distinctly in favor of water shipments from Baltimore, Hampton Roads and Philadelphia. The order affecting rates on anthracite to Philadelphia for use there had no effect on shipments to New England.

General Conditions

Speaking broadly, the Seaboard bituminous trade was throughout under severe depression—a situation it shared with most other industries. The market was slow and apathetic, regardless of season. In New England the trade has become more and more involved with the increased use of steam colliers. The larger consumers are receiving fuel almost exclusively in this way and with the advantage of regular movement it is possible we shall not again have the kind of winter market that could formerly be counted on, due as it was, in large part, to the slow movement of sailing vessels during the storm season. Facilities are now well adjusted to these modern methods and aside from its effect on fuel *consumption* the weather is not now the factor it used to be.

Soft spots in the market appeared prominently early in March and there followed a long period of extreme dullness. The mills had more water power than they could use, as it was the heaviest in years, and as a result even the contract demand was light. Late in April some extra requisitions from the Navy Department caused talk of better conditions but it was soon over and by July the season was commonly referred to as "the dullest on record." It was realized that only the most rigid curtailment could mend matters, and for the time this was enforced there was a steady improvement in the position of all grades.

The Collapse of the Export Bubble

But it was not allowed to last. The European war seemed to open a wide vista; American shippers saw a broad market before them and one that grew more and more extended as they dreamed. A few New England buyers became worried and tried to make extra purchases but their offers were refused and shippers began saving output two months ahead to send to the far corners of the earth.

For a few weeks there were some export orders, prices hardened at $2.85 Hampton Roads, and there were rumors of 10@15c. premium, but gradually there came a change. It appeared that German and Austrian ships were driven out of trade, that the English government was chartering all the tonnage it could lay hands on, in all 1500 steamers it was said; in other words, suitable carriers were scarce with rates high, and American shippers could not compete.

It appeared also that exchange was difficult to arrange; in South America merchants were requiring two, three and four months' credit, and then usually a renewal, a circumstance not at all attractive. The American shipper had always looked upon offshore business as quick-cash, and the results of some of the August transactions were disappointing. So the export trade sagged off, and with this prop removed from an otherwise weak market, late October saw the bituminous trade again in the doldrums and the outlook more discouraging than before.

The interesting thing was that throughout the 60 days or so of dalliance offshore, the New England market was not at all responsive. The local buyers who had been turned down by Baltimore or Hampton Roads shippers either stayed out of the market or bought small quantities from Pennsylvania, apparently very confident that Philadelphia and New York could meet all requirements if by any chance the Southern ports could not. It was a dull season and the consumer refused to be scared.

New Haven R.R. Fuel Purchase

Notwithstanding the great pressure to sell output from all the American fields, the New Haven R.R. in October placed an order for 200,000 tons or so of its Boston requirements with interests that ship provincial coal from Cape Breton. It was later followed by another order for 75,000 tons from the Boston & Maine R.R., an aggregate of 275,000 tons that for years has come from either West Virginia or Pennsylvania. The use of English colliers has made the deal all the more criticized and it will be some time before the local agencies feel right about this remarkable transaction.

The Close of the Year

Late in the year, there were a few small signs of improvement. Scattering plants, mostly special lines of textiles and shoe factories, were running to capacity on foreign orders, and it was predicted that other industries would gradually fall into line. The process will be gradual, however, and New England buyers are likely to be even more conservative this year than last; they have observed the course of prices in 1914 and unless the unforeseen occurs, the spring of 1915 will probably be a slow season for placing yearly contracts.

In general, 1914 held up to the coal trade some rather plain truths. The operators were especially impressed with the fact that their output and profits depend on the general prosperity of the country, and that only by keeping in intelligent touch with market conditions and regulating their output accordingly can they secure a reasonable net return on their product.

Pocahontas and New River

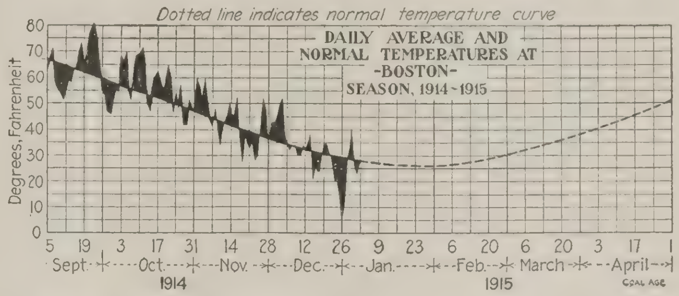
The Hampton Roads piers were glutted with coal practically the whole 12 months. It was nothing unusual to see 600,000 to 800,000 tons standing on cars at the three terminals. With that as a preliminary it is not surprising that, except for brief intervals, Pocahontas and New River were weak in price throughout the year; $2.85 f.o.b. ($1.45 at the mine) was early announced as the season contract basis but the fact that through February and March spot sales were made at 5@10c. less did not inspire much confidence among buyers.

So the season dribbled along, contracts being closed very slowly and in most cases at certain alongside or on car arrangements that did not disclose the base price, although it was understood that $2.75 was not far from the actual figure. A clause protecting against a decline in the market was freely given; in fact this was the only form of contract buyers would consider. There was also an evident determination on the part of some shippers to regain tonnage lost in 1913 and still under the cloak of minimum water-freight guarantees most of the remaining contracts were gathered in. The spot market was extremely sluggish and as early as March it was observed there had not been a slower or duller period for West Virginia coals since the summer of 1912.

For a time it seemed the operators were agreed that nothing could be gained by forcing supplies on a reluctant market. Contract demand slackened materially during April; most shippers, committed on marine transportation, were obliged to load vessels as they arrived, and never was there a season when cargoes were handled so quickly or the boats themselves made such uniformly fast trips. The market absorbed the coal with increasing slowness and it became apparent prices would give way. Concessions at distributing points like Boston and Providence had a serious side when considered in connection with contract business on which shippers were most anxious to see the season basis maintained. Had it not been for these early contracts the spot market would probably have been forced so low that shipments "on the market" would have been discouraged.

Again, large consumers were holding shippers down to minimum deliveries, and various Pocahontas and New River operators apparently concluded to keep mines running, regardless of the prices that could be had; $3.30 and less was the figure at Boston in May, some 50@60c. less than contracts had been closed at, and there was no longer any pretense of netting $2.85 at Hampton Roads. Even a general curtailment of three days a week in Pocahontas failed of results and delivered prices were frankly based on $2.50@2.65 on the few sales that were made.

In brief, the New England Tidewater market in June and July was as near demoralization as at any time since 1909. A three- to five-week wait on large vessels for disposition orders was not unusual; buyers grew so callous to low prices that they ceased to respond, and it was soon plain that any ordinary "cut" was as ineffectual as none at all. On-cars Portland, "distress" Hampton Roads coal sold at $3 in July. The most drastic restriction clearly was the only hope and by Aug. 1 most of the operating interests got into line on such a plan.



The attractive export market loomed up at this juncture and all were most keen for a share of it. In a few weeks $2.85 was once more reasonably firm and on-car prices in New England stiffened, although this was only because the surplus supply was shut off. The export business, however, falling far short of expectations, let the West Virginia coals in for a decided relapse late in September.

All outlets proving spotty and unreliable, the situation was desperate enough. Had it not been for the well grounded conviction on the part of selling agents that even a radical "cut" would accomplish nothing, $2.85 would have been more severely slashed than it was. Had there been any spot demand of any consequence there would surely have been a scramble to see who would go lowest but as it was, quotations as low as $2.50 were general.

A few fall contracts were held in abeyance because of the softness of the market. There was apparent, in November, a further lack of coöperation among operators; some were restricting output consistent with market conditions, but others were not, and the cost must have been serious to the latter. New England is so widely tied up on yearly contracts that sales in the fall were most infrequent, especially on Pocahontas and New River, and in December, buyers not being interested at any price, the year closed with $2.50@2.75 f.o.b. the nominal range, the figure depending on the degree of distress in which shippers found themselves. The closing of a large powerhouse contract for an 18-month period, at a price understood to net $2.70 f.o.b. was a further indication that 1915 prices would open under a severe handicap.

The lack of a consistent policy among the Pocahontas and New River interests and the too frequent recourse to "market cargoes" were the leading features of the trade in 1914.

Georges Creek Coals

On the other hand, shippers of Georges Creek were able to follow their usual even course with regard to output and prices. When the demand became slack, the output was curtailed, and when a broad market seemed in prospect in August the operators had the coal on hand in enough volume to give the prompt service desired.

Georges Creek is popular with many buyers in this territory and while its following is relatively small, as compared with the users of Pocahontas and New River, it can always command the top of the market and when other shippers are short of orders the Georges Creek factors are usually well supplied. It is, therefore, a simpler matter to adhere to a price program and particularly so when a very large proportion of what comes to New England is in steamers and barges controlled by Georges Creek operators. There is not often the need to sacrifice this coal at the loading piers.

The year opened with Georges Creek firm with regard to price but facing extremely light inquiry, both spot and on contract. A more or less drastic restriction was in force through January and February, relieving the shippers of any pressure to shade prices. Early in March they had closed about their usual contract tonnage on the same basis as the year before, namely, $2.85@2.95 f.o.b. Baltimore. A certain amount of business had been lost on the low water-freights the Pocahontas and New River people were, in some instances, willing to guarantee, but the Georges Creek shippers came quickly into line on delivered prices and regained, during March and April, most of the tonnage the Southern agencies had hoped to take away. At the same time, in some directions, West Virginia coals made serious inroads on Georges Creek, and the aggregate for the year was considerable.

In June there was again a period of lively competition with Pocahontas and New River on delivered prices, but it soon subsided and the balance of the summer quotations were steady and firm in spite of an extremely dull market. The shippers were all the while in position to name figures alongside Boston that would defy analysis but they preferred to shorten production and hold the market so far as they were able. During July Georges Creek was put on wheels only on firm orders; there was no spot market, and therefore no accumulation at any of the loading ports. So far was this carried that when spot business did develop, principally for export, in August, foreign steamers were given loading preference, while coastwise bottoms were obliged to wait.

Georges Creek shippers have long been much interested offshore and for a few weeks in August and September they had had so much more business than they could handle comfortably that there was anxiety here among consumers who depended on this grade for their supply. In several cases bottoms intended to load Georges Creek were diverted to Hampton Roads, but in October all this ceased and the coal was again coming forward in normal amounts. Arrears were soon made up, and except for short intervals when weather prevented, Georges Creek was in good supply the balance of the year, with enough orders to insure a steady flow of coal to Tidewater.

F.o.b. Philadelphia the season price was $2.92@3.02, and $3.22@3.32 f.o.b. New York, the same as the year 1913-1914. All-rail trade on Georges Creek was normal and even throughout the season, $1.67@1.77 f.o.b. mines being the range of prices.

The Pennsylvania Grades

The superabundance of Southern coals the year through had a blighting effect on bituminous from Pennsylvania. Prices were low and the market much restricted, so that neither in tonnage nor in returns at the mine could the year compare with 1913. The quality grades had about the usual patronage; in that respect they compared favorably with Georges Creek, but the medium-priced coals went through a very unsatisfactory season.

So long as Hampton Roads shippers hold firmly to a basis of $2.85, there is a good market for Clearfields and Cambrias that ordinarily range from $1.15@1.50 at the mine, but otherwise the outlet is narrow. There is increasing complaint, however, that the West Virginia coals are not as free from impurities as formerly and that is an element that will probably be more emphasized as time goes on. Many of the central Pennsylvania operators are taking the greatest pains with uptodate equipment to clean coal properly and if this can be done systematically there is no doubt of an increasing representation in this market.

As a case in point, the Navy Department in 1914 awarded more than one contract to Philadelphia and New York shippers in direct competition with the best of Pocahontas and New River, and after exhaustive trials. The year further established the fact that the largest of the naval colliers can safely load at the Philadelphia coal piers, thus demolishing a time-honored argument for Hampton Roads and Baltimore loading.

The market record last year on the Pennsylvania grades seems too dreary to go much into detail. In February accumulations were so large at Philadelphia and New York piers that an embargo was in force on certain of the railroads. When that congestion had been relieved, labor differences served to curtail output during April and May, to quite an extent, and quotations were a trifle firmer than early in the year. The higher grades from Somerset and Cambria Counties were up to $1.60@1.70, the less favorably known Clearfields 95c.@$1.15, and the better varieties $1.20@1.40. Trade was dull, however, in every direction, and only by holding shipments well down to actual requisitions could the operator make anything like a showing. When demurrage accrued the operating margin quickly vanished. The poorer grades from Clearfield fell off to 80@85c., or 10@15c. lower than in 1913.

The much diminished transatlantic traffic from New York was a heavy blow to the bunkering trade and indirectly to all the districts in Pennsylvania. This was further accentuated when, late in the fall there were quantities of coal offering in New York Harbor that had been *taken out* of ocean liners.

Throughout the twelve months, "distress" coal was offered both at New York and at Philadelphia and there was hardly a week when there was any life to the market. For a short time in August a few comprehensive orders were placed with Pennsylvania shippers, orders that the Southern agencies had declined, but the demand was momentary and had no general effect on the depressed situation.

From September to the end of December there were only small fluctuations in price; operators had set their minimum back in the spring, and further reductions were only made when they had coal on hand they were under compulsion to move. At no time, however, was the proportion of coal on wheels anything like as large as in the Virginia. By and large the Pennsylvania interests seem to have shown good sense through a very trying year. In the fall, many of the mines were on a two-day-per-week basis.

The all-rail business shared the disadvantages of the market at tide. At times it was fully as stagnant and as a whole has been unrelieved by any favorable features. The low prices at New England Tidewater distributing plants had a natural tendency to limit the rail market, and a constant pressure to sell coal was the characteristic feature.

WATER FREIGHTS

As usual, coastwise freights in 1914 kept step with the coal market. Rates were uniformly low. There was no such level as the 95c.@$1 rate that prevailed early in 1913; in fact, it would probably be difficult to find an instance where more than 80c. was paid a sailing vessel or barge, 2500 tons and upward, Hampton Roads to Boston, at any time in the calendar year. On the other hand, during June and July large vessels could be had for single trips at 55c., and steamers were let at 50c., the lowest rate per ton in twenty years. There was a surplus of steam, sail, and barge tonnage at all times and only when storms worked havoc or delayed movement was there any change; 65@70c. was the highest range that obtained for any period longer than a week.

A chart of rates would not be so significant or comprehensive as in years back. The volume of coal carried to Boston in sailing vessels has steadily decreased and that carried in steamers has steadily increased. Coal steamers almost exclusively are on Government form calling for a *per diem* charge rather than a rate per ton and it would therefore be very difficult to make a comparison. Then again, most sailing vessels in the trade are now taken on season charters at a reasonable rate through several months if not the entire year, and this, of course, tends to make rates steadier.

Several steam colliers built for the coastwise trade not only took cargoes to the Pacific coast *via* the Canal but went during the fall with grain, cotton, and other supplies across the Atlantic, availing themselves of the high rates. Sailing vessels also took freights through the Canal and to South America, but many of the coal schooners lay idle for months. Owners suffered heavy losses in 1914; in one gale alone, in January, more than $1,000,000 in vessel property was lost along the coast.

The Reading barge rate on bituminous was reduced Mar. 1 from 90c. to 80c., Philadelphia to Boston, and was further reduced in July to 75c., at which point it remained the rest of the year. Through the spring, summer and fall 40@45c. was the market rate for New York loading to points south of Cape Cod, but this was advanced to a minimum of 50@55c. in November when thick weather affected the supply of barges. 50@55c. continued the rate on anthracite coal carrying railroad transportation from New York to Boston, and 75c. from Philadelphia, the same as for several years.

CAPE COD CANAL

The Cape Cod Canal was formally opened July 29 and has been more or less in use since that time. So far it can admit vessels only up to 15-ft. draft, and it is perhaps too early to measure its usefulness. It is supposed to make a saving of 70 miles in the passage to Boston in addition to avoiding the treacherous shoals in rounding Cape Cod. At current water rates there is an impression that 7c. per cargo-ton is more than transportation owners can afford to pay.

ANTHRACITE

The hard-coal trade in general afforded a pleasing contrast to the situation in bituminous. While early in January the demand was listless, due to the mild weather, lower temperatures began to prevail and lasted well into March. Orders were plentiful in consequence and not in years was there so little coal in consumers' cellars as in the spring of 1914. April business, therefore, was excellent and all the companies that regularly ship to this market had a most satisfactory trade through to July 15. Receipts of anthracite the first six months at the Port of Boston were more than 50,000 tons in excess of the corresponding period of 1913 and that is an indication of the increase all over New England.

Directly business sagged off in July the mining interests cut down production, so the rest of the year there was mined only slightly in excess of what the market readily absorbed.

Stove coal was in short supply the whole of the first half-year, and into the fall the shippers were obliged to restrict orders to not more than a third in a cargo. The demand for this size has so much increased here, to the exclusion of egg size, that dealers were anxious over the prospect for fall and winter. They, of course, used every effort the first of the season to get stove shipped and accepted as little of the egg and chesnut as possible, and one result was that in the dullness through November and December, stove was as easy to get as any other size. An advance of 25c. on stove at wholesale was rumored in March as an effort to shift demand to other sizes but nothing came of it. Broken size was also in short supply in the spring but was rapidly corrected as the season advanced.

There has been some mild agitation here in favor of what used to be known here as "No. 4 Stove," a size between the present stove and chestnut. One of the objections urged is that the demand would be so great there would be even more difficulty supplying it than has been the case with ordinary stove, well mixed with small egg.

Wholesale prices on anthracite, delivered alongside Boston, remained substantially the same as established in 1912, namely, $5.25 as the net circular per ton 2240 lb. The only change involved the Pennsylvania state tax first assessed in July, 1913. Some shippers added a flat 10c. to the price and others charged the exact amount laid upon them.

Boston retail prices were advanced in July and again in August, 25c. in each case, as against three similar advances in 1913. Egg size, however, was brought to the level of stove, so that $7.75 was the price of egg and stove and $8 the price of chestnut the end of December.

The New York Markets in 1914

Bituminous

By J. W. Searles*

SYNOPSIS—The market was generally adverse throughout nearly all of the year. Prices were weak though maintained at fairly good figures.

The New York market for bituminous coal during the year 1914 was influenced by the conditions which obtained generally in the Eastern States. In the fall of 1913 there was a decided improvement in business and prices hardened immediately as a result of the increased demand. Consumers who inquired for figures on coal to be delivered during the winter months found the operators reluctant to quote, as they had every reason to believe that the coal trade would share in the general revival of business. They also expected consumers to accumulate large stocks in anticipation of a probable suspension of operations at the mines on Apr. 1, when the wage scale expired.

Unfortunately, the improvement in general business did not continue, and though January shipments of coal were in fair volume, there was a considerable falling off in demand during the following month. Consumers took coal rather freely in March, in aticipation of trouble at the mines, and this prevented the establishment of a new winter record for dullness. While the miners had asked for a considerable increase in wages, when the time for negotiations arrived they found it impossible to sustain their position, and their early acceptance of the old wage scale stifled the hope that stocks might be materially reduced before work was resumed.

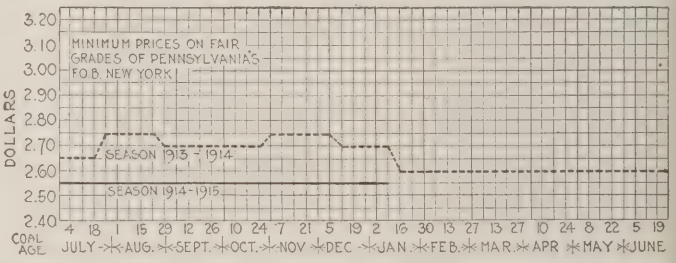
The long-deferred action of the Interstate Commerce Commission on the question of railroad freight rates was partly responsible for the general stagnation, which became more apparent as the summer approached, and the coal trade suffered in common with all other branches of business. Coal did not begin to move freely until July; in fact, the better tone of the market was only becoming apparent when the breaking out of the war in Europe sent a chill over the business of the whole country. The curtailment of Trans-Atlantic sailings almost immediately affected the bunker trade of the Seaboard and particularly that of New York Harbor. To a certain extent, this was offset by the heavier demand from semifreight lines and tramp steamers carrying goods to foreign ports.

The whole Eastern market was, however, favorably affected by the increase in coal exports to Europe and South America. While most of this coal moved from the James River ports, and the balance from Baltimore and Philadelphia, the absorption of a portion of the surplus from the Eastern fields strengthened the general market, and the prices for Southern coals in New England.

Late in the fall the demand from abroad for our cereals and manufactured articles increased as did also the consumption of coal by the railroads moving this freight for export. The seasonable weather in December was also a favorable factor.

There have been but few years when there were more discouraging conditions in the bituminous trade than in 1914, and the firmness with which prices held during this trying period speaks well for the trade in general, indicating a determination to curtail operations rather than force coal on the market at unprofitable figures. Of course, there were offerings of demurrage coal from time to time, and some low prices were recorded, but most of these were for fuel which had been shipped to tidewater in March and April in anticipation of a prolonged period of inactivity at the mines supplying the New York market. Throughout the year there was a fairly good demand for high-grade low-volatile coals, and it may be said that practically none of these was sacrificed. The high-volatile coals, including those from the gas regions, were in much less demand than formerly, due to the conditions in the iron and steel trade and such other industries as require fuels of this character.

Probably no industry is of more importance to the bituminous coal trade of the United States than that of steel production. Quite a large portion of the coal mined in Pennsylvania and West Virginia is manufactured into coke, and the inability of the iron and steel manufacturers to take their usual supplies had a marked effect on the soft-coal market. While many of the mines producing coking coal suspend operations when there is a decline in the demand for coke, this is not true in all cases.



Some Market Changes

One of the most striking features of the year was the change in the market for gas slack. In 1913 this commodity brought high figures, and during the greater portion of the year was in such demand that it was almost impossible to purchase "spot" supplies, practically all the tonnage being under contract at prices satisfactory to the operators. This year many contracts were written on a lower basis, and during the greater part of the time it was almost impossible to move slack at any figure. The situation was directly traceable to the curtailment in the production of the steel plants and cement works.

Each year shows an increase in the use of bituminous coal in and around New York, and this is one of the most encouraging features of the trade. The general falling off in the quantity of anthracite steam sizes, available for shipment to the New York market, is forcing some of the larger consumers and many of the smaller ones to increase the proportions of bituminous coal, or to use it exclusively. As many of the hotels, office buildings, etc., are equipped for the burning of anthracite coal, the point has been reached where it is necessary for the anthracite producers to conserve a considerable quantity of their steam sizes for this class of trade, the demands of which are increasing. The larger consumer must continue to displace anthracite with bituminous coal.

While the foreign demand for American coal is helpful and the efforts of our shippers to enter the export field are most commendable, the home markets are those in which the bituminous coal producers must sell all but a fraction of their tonnage. Nothing but a revival of business in the East will put the industry on anything like a capacity basis. It is too early to predict to what extent general trade will be benefited by the recent advance in freight rates, but one result will no doubt be the releasing of some of the orders for needed materials which the railroads have long deferred placing.

---

*General sales agent, Pennsylvania Coal & Coke Corporation, 17 Battery Place, New York City.

It is not necessary to refer to the many factors which enter into the full situation. Of course, the most important is the trend of affairs in Europe. The bituminous-coal industry is surely on a much better foundation than it was a few years ago, notwithstanding recent failures, practically all of which serve to emphasize the fact that all business, to be worth while, must be conducted at a profit.

* * *

Anthracite

By G. W. Seiler*

SYNOPSIS—There was a fairly good year in anthracite though not what might have been expected. The industrial situation caused a marked restriction in buying on the steam grades and the domestic sizes were heavy during much of the year.

Though production has not increased during the past year, it has at least equaled the previous year's record, and this, notwithstanding the general business depression that swept the country during the last six months. The bituminous trade has passed through one of the worst periods in its history, due to the curtailment among large industries and the shutting off of bunker and export trade through the European war, but with anthracite the demand has not abated except in the steam sizes and that only in the lower grades. Even this might be explained by the fact that the better-grade steam sizes are in popular demand in large cities, where the use of soft coal is prohibited, while the lower grades are more dependent upon the manufacturing trade.

During January, February and March, particularly in February, there was a shortage of steam sizes in all grades, due to the extreme cold weather and the meager stocks of the large companies. The middlemen profited by this shortage as premium prices were obtained. Prepared sizes during that period were also in good demand, particularly at line points. By the middle of March conditions rapidly changed and Tidewater prices among the individuals fell off to the April circular.

The usual opening spring prices were announced on Apr. 1, and instead of charging the Pennsylvania state tax of 2½ per cent., most of the companies issued a straight circular on prepared and pea sizes, which included this tax. This made the circular price for upper port coal as follows:

Broken	$4.60	Pea	3.55
Egg	4.85	Buckwheat	2.80
Stove	4.85	Rice	2.30
Nut	5.10	Barley	1.80

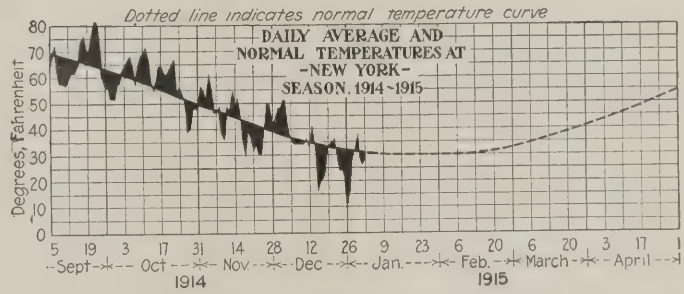
The regular increase of 10c. per ton each month on the prepared sizes became effective May 1, so that by Sept. 1 the full winter circular of 50c. per ton higher prevailed.

The Heavy Demand for Stove Coal

The spring demand for coal was about normal and continued so until July, at which time egg and nut fell off, while stove continued in strong demand during the remaining summer months and was the best seller during the fall. But at the close of the year stove weakened and sold by the individuals at ten to fifteen cents off.

This large demand for stove is due to the fact that it is 25c. cheaper than chestnut, which, in itself, has obligated the dealer to push the sale of stove in preference to nut. Though it was rumored that the large companies were considering making the price on both sizes alike, nothing developed on these lines. Equalizing the prices on these sizes would doubtless revive the old popularity of nut coal and furthermore it would necessitate increasing the price on nut the same amount.

Egg coal continued to be the stumbling block with the individuals during most of the year, selling at 25 to 50c. off circular, according to the conditions existing; throughout the entire fall there was no difficulty in securing this size from the individual operators at 50c. off. However, most of this low-price egg was the Lehigh grade, the free burning and Wyoming qualities bringing better prices. The large companies, due to their stocking facilities and trade connections, easily avoided the predicament the individuals were confronted with to move this long size and avoid heavy demurrage charges.



The Outlook for 1915

The anthracite trade can congratulate themselves on having passed through the year of 1914, a period of many perplexities, with better success than their bituminous friends. Only recently, Commissioner Rice, of the Coal Merchants' Association, stated, that from statistics then at hand, local retail conditions during the year were the best for a long time. With the exception of February and March, the retailer at no time experienced any difficulty in securing his supply of coal, while prices were unusually well maintained and collections very satisfactory, due to the splendid system adopted by the Coal Merchants' Association.

The coal trade is very optimistic as to what the new year of 1915 will develop. The recent 5 per cent. increase in freights may possibly help to better conditions throughout the country, and while a feeling of uncertainty prevails as to what effect the continuance of the European war will have on the business conditions in this country, nevertheless the year 1915 cannot be much worse than its predecessor. The possibility of a busy fall and winter ought to be in store for us, considering that the anthracite wage agreement of 1912 expires Apr. 1, 1916, and a repetition of the winter of 1911 may again develop at the close of 1915.

Philadelphia Coal Market in 1914

SYNOPSIS—In the anthracite market nothing sold well but stove, and the demand for it compelled the making of large quantities of less easily salable sizes. It is likely that a readjustment of prices may be made with the idea of making this size less popular. Both anthracite and bituminous markets were distressingly dull and prices low most of the year.

Anthracite Market

The year just passed might be characterized as one of over-production of anthracite, as is witnessed by the fact that dealers were constantly well stocked throughout the year and the large operators carried heavy reserves. It is doubtful if at any other period was this so evident as in close of the year 1914. It is understood that the gigantic storage facilities of the various companies at Hauto, McClellan, Schuylkill Haven, the Amboys and Port Richmond are crowded with coal, including fuel of almost every size with the possible exception of stove. For coal other than of stove size, if the active periods of April and May be eliminated, at which time it is always rather difficult to supply the demand, there has never been a call that could not be immediately supplied. In fact, taking the year as a whole, it is doubtful if the steam-size market has ever passed through such a season of adversity.

The Delayed Winter of a Year Ago

The months of January and February, which are usually considered as two of the best coal-burning months, showed business fair, and while there was a good steady movement, it was necessary in some quarters to curtail the production. This was occasioned by unusually mild weather, and it was not until the close of February and early March that the temperature fell to anything like its normal level. Several heavy snowstorms followed by low temperatures temporarily created an active call for replenishment of supplies, but as early as the middle of February, "individual" operators were creating a market for their output by offerings at the April circular or even less.

The month of March, outside of the flurry early in the month, resolved itself into the waiting attitude which characterizes the market at this time, and the first of April found the trade good, but rather indifferent in marked contrast to its stand in previous years. The reduction of prices on the first of April no longer improves the volume of sales as definitely as it did formerly.

While at that time the operators are well supplied with orders, the dealers state that there is a gradual falling off in the business from householders, who used to take on their supplies at the low prices. For several years domestic consumers have had no fear that there would be trouble at the mines and consequently they have been unwilling to tie up their money in a cellar-full of coal that will not be used until the following winter. Consequently, during the fall and winter of 1914, the requisitions to dealers were coming in one- and two-ton orders.

April and May brought the usual spring reduction, putting the business on a better footing, and the demand for these two months equalled the output of domestic coals.

Some Price Cutting in the Summer and Fall Months

But in the month of June the trade first commenced to give indications of what might be expected for the balance of the summer. The large operators rigidly curtailed the production at the mines and, even then, it was found necessary to dump much of the output of steam as well as some of the domestic sizes, because the demand for certain sizes of fuel compelled the operators to mine more coal than could be disposed of in its entirety. The industrial depression was no doubt largely responsible for the falling off in the call for small sizes, and the individual operators whose facilities for storage were small, forced the prices for these sizes to a rather low level.

Concessions on Circular Prices

The contract prices at the beginning of the year were: pea, $2.25; buckwheat, $1.25; rice, 85c., but during the summer months, these figures were forced down in some cases 25 to 30c. per ton. It was only with the help of stove coal that the large operators were able to dispose of their other sizes, as in most cases, the "individuals" were not hesitating to make concessions from the circular price in order to move their product, irrespective of size.

It was hoped that October and November would prove more active than the early fall, but conditions remained about the same, and while a considerable tonnage was placed, it was only by the most strenuous effort that much was accomplished.

In December the market improved, due to the fact that better weather conditions prevailed, and the year closed with the prospects of good business for the balance of the winter season.

Few Premiums over Circular Prices in 1914

It is doubtful if there ever has been a period during the last few years, when the "individuals" have lacked the opportunity to sell their output at a premium over the so called circular prices, but this chance was not given them during the past season. The quiet demand which has existed throughout the year has resulted in little premium coal, and the average prices realized will probably fall considerably short of the maximum figures received by the large operators for their respective sizes.

Egg, chestnut and pea have been sold at anywhere from 15 to 60c. less than the prevailing prices, depending on the season of the year, and the smaller sizes were sold in some instances at figures that would hardly net the freight. Offers of $2 for pea, $1 to $1.15 for buckwheat and 65c. for rice, indicate the trend of individual offerings.

The Demand for Stove Coal Unbalances the Industry

A summary of the trade for the year would indicate that there has been no size, with the possible exception of stove, which has maintained its strength throughout. This size has doubtless been the means of moving the other domestic sizes. It is not unreasonable to predict that there may possibly be a change in the price of this size in the beginning of the coal year, or Apr. 1, in an effort to divert the demand to other sizes.

The statement below will give some idea of the fluctuations of the stock on hand at the Tidewater storage points and indicates that, despite the demands of winter, these stocks show an inclination to increase.

STOCKS OF ANTHRACITE ON HAND AT TIDEWATER STORAGE POINTS

Month	Tons	Month	Tons
January	591,000	July	514,000
February	523,000	August	582,000
March	632,000	September	645,000
April	453,000	October	745,000
May	485,000	November	811,000
June	554,000	December	800,000

Bituminous Market

The year just passed has been disappointing in almost every respect. Commencing as it did during the month of January and continuing well into February at what were considered as abnormal figures, the market receded till prices hardly paid for the cost of operation. The market continued strong during the first two months of the year, but about the first of March, indicated not only a substantial decrease in demand, but also in prices.

It was confidently expected that the threatened strike of the miners in the Ohio and western Pennsylvania fields would have the effect of instilling activity into the trade, but on the contrary, but little interest was shown. This was probably due to the fact that the railroads, as well as the industrial establishments using this class of fuel, had fairly large stocks of coal and were consequently indifferent to the importunities of salesmen. This condition brought prices rapidly to a lower level. From the settlement of the differences with the miners, after a conference of about four weeks, until the first of the year, conditions went from bad to worse, and quotations were lower than for several years.

Buyers Refuse to Contract with Results Satisfactory to Themselves

Many establishments refused to contract at a fixed figure, preferring to buy their requirements on the open market, and the judgment of their purchasing agents has been justified, for at no one period during the last six months, has it been impossible to secure prompt shipments, at prices considerably less than the contracts offered. The medium grades of coal are now offered at from 90c. to $1 at the mines, with the better grades from 30 to 35c. more than these figures, and the most optimistic see little room for improvement in the near future. Altogether, the past year has not been profitable for the bituminous operators, and more than one will find that he has lost money.

Coal-Trade Conditions in Buffalo during 1914

SYNOPSIS—Stagnation was the dominant feature of the Buffalo market during the year. Only about two-fifths as much iron ore was received as in 1913, and there was a marked decline in sales of coal and coke to Canada. In the anthracite trade, conditions were far more satisfactory and the year closed with prospects at least normal.

The dullness that pervaded the Buffalo market well back in 1913 in the bituminous and coke trade has continued. As a rule, no reports have been received from any source that did not complain of decline in demand or of factories shutting down. All bituminous coal and coke business has stagnated so badly that a report of conditions, in detail, would fail to discover anything like the variety that is common in a normal year's transactions.

In some respects it has been fortunate and in some quite the opposite that certain of the leading coal operators in Pittsburgh have a way of signifying about Apr. 1 what they will call the Buffalo price for an indefinite time. This forms a foundation to work on, but when prices sag and the informal circular remains unchanged, it is not easy to say what should be done.

The only coarse that seemed feasible during the past year was to continue the Pittsburgh figures; namely, $2.80 for lump, $2.70 for three-quarter, $2.55 for mine-run and $2.15 for slack, at which prices the best Pittsburgh coal has always sold to some extent. There has been no particular change in the relative market prices of Pittsburgh and Allegheny Valley coals, the latter running from 20 to 30c. lower than Pittsburgh for prepared sizes, all slack selling about on a par.

There has been no change in the number of blast furnaces in this district, though some of them have not been active of late. The amount of iron ore received here by lake during the season of 1914 was 2,770,000 tons, as against 5,200,000 tons in 1913, which tells the smelting story pretty well.

The decline in the demand for coal from Canada has been greater during the year than from the Buffalo territory in our own country. Canada has for some time been suffering from land booms and the war has affected the Dominion much more than it has the United States. Buffalo sells a large part of its coal in Canada and was consequently materially affected by the changed conditions.

There are no figures available showing the amount of coal, either anthracite or bituminous received in Buffalo, but the estimate of 6,250,000 net tons of anthracite and 7,500,000 tons of bituminous, has probably not been exceeded. Of this amount, about 1,600,000 tons of anthracite and 3,000,000 tons of bituminous, as well as 475,000 tons of coke are annually exported to Canada, which sufficiently indicates the importance of the Canadian trade to Buffalo.

The anthracite trade has been satisfactory for the most part and the outlook for it at the close of the year is fully up to the normal. There has been practically no change in the Buffalo situation during 1914. In the former year several independent anthracite companies located branch offices here. These are still doing business and local bituminous shippers have continued their anthracite sales, so that the trade appears to have been kept up. The indepnedent anthracite price has not lately been at a premium, though sometimes during the previous year it was easy to obtain 50c. or so extra on prompt shipments.

Lake shipments of anthracite closed on Dec. 9. The amount shipped, according to the custom-house record, being 4,386,226 net tons. The amount for the season of 1913 was 5,033,696 tons, which was the largest in the history of the trade. It is likely that there is as much coal on Upper-Lake docks now as there was a year ago.

⁂

The Hampton Roads Piers in 1914

By J. W. Bunting*

SYNOPSIS—The Norfolk & Western Ry. increased its dumpings 400,000 tons but apparently the two other roads made no gains. The activity of the shipments to Italy and the establishment of trade with Greece were the principal developments of the year. New facilities for handling were put in operation.

The year now closing has seen great activity at Hampton Roads, as well as many improvements for the prompt handling of both cargo and bunker vessels. Early in the year the large steel pier of the Norfolk & Western Ry. was completed at Lamberts Point and almost immediately great improvement was noticed in the rapidity with which vessels were dispatched on calling there. This pier has made numerous records for heavy dumpings, such as 872 cars in the space of 24 hr. It had hardly been working six months when the Chesapeake & Ohio Ry. completed its dumping facilities at Newport News. With these piers and those of the Virginian Ry. at Sewalls Point, Hampton Roads is now in position to lead the world in the dumping of coal into all classes of vessels.

Prices Were High just after the War Broke Out

There have been constant changes in the prices of the various grades of coal handled out of Hampton Roads and while it is difficult to arrive at a definite average price for the year a fair estimate would be about $2.80 to $2.85 for New River and Pocahontas run-of-mine and $2.60 to $2.65 for high-volatile coal. There have been times, of course, when prices have gone considerably above these quotations especially just at the outbreak of the European war when some of the suppliers were quoting as high as $3.10 per ton on New River and Pocahontas, although it is not believed that any great amount of coal was sold at this figure.

The South American market since the beginning of the war in Europe has been a large buyer of coals from Hampton Roads, although there now appears to be some falling off in the demand from this source. This is no doubt due to the buyers not having used the supply which they took in early in the fall and the prospects are that they will again be drawing heavily from this market during the beginning of the new year.

It was hoped that 1914 shipments would show an increase over 1913 of at least one million tons but from statistics now obtainable it appears that the figures for the two years will not be markedly different though, perhaps, there will be a gain of about 300,000 tons for 1914.

The European war undoubtedly caused some gain in the export movement during certain months but at the same time there was also some reduction in the coastwise movement for factory and other use in New England. September was a record month for heavy dumpings at this port, the quantity of export coal during that month amounting to about 50 per cent. of the whole movement which is unusual for Hampton Roads. The total dumpings for September were 1,271,772 tons; August came second, 1,108,539 tons being shipped during that month.

An explosion in the Eccles mines of the New River field during April greatly reduced the output from that region for some weeks and to some extent helped to cut down the total movement for the year.

Coal Shipped to Italy, Greece, Norway, Sweden and the Canaries

Large orders have been placed at Hampton Roads ports by foreign buyers all through the year, the most notable, no doubt, being those from Italy and Greece. Coal has for many years moved in large quantities to the Italian market but there has been little demand from Greece until the present year when contract was made for furnishing this market with about 100,000 tons. Until the outbreak of the war there was a growing demand from Austria but under present conditions this has been entirely cut off. Norway and Sweden have also taken some few cargoes. Some coal has also been shipped to the Canary Islands. This is not usual, though they had bought coal in the United States before whenever there was a difficulty in getting it from England or Wales.

There seems to be a decided difference of opinion among the various coal suppliers as regard the South American market and although inquiries for large quantities have been made at different times there have been no reports of any very large contracts being closed and so far as can be learned such coal as has moved to the South American countries has been sold mostly in one- or two-cargo lots.

There was much disappointment at Hampton Roads when the contract for supplying the U. S. Government was awarded. Heretofore, practically all or at least the best part of this business was handled here but under the present arrangement shippers at the Northern ports were awarded a large share of this business. While practically all the supplies at Hampton Roads were assigned some business at the same time they did not receive as large a percentage as in previous years.

Over a Million Tons per Month Loaded at Piers

There have been five months, viz.: March, April, May, August and September, when the total shipments amounted to more than one million tons per month and up to Dec. 1 there were only two months where the dumpings fell below 925,000 tons. Of the total dumpings during eleven months the Norfolk & Western Ry. has moved within about 100,000 tons of the combined movement of the Chesapeake & Ohio and Virginian Railways. Without taking into consideration the dumpings for December, the Norfolk & Western Ry. on Nov. 30 was within about 20,000 tons of its yearly movement for 1913. After

---

*P. O. Box 872, Norfolk, W. Va.

deducting this tonnage from their December movement the balance of the month's business will be their gain for the year and this should amount to at least 400,000 tons. The outlook, however, for the Chesapeake & Ohio and Virginian Railways is not so bright and it is not anticipated at this time that either of these roads will have made any gain over their 1913 movement from this port.

Taking the year 1914 as a whole it has hardly come up to the expectations of the shippers from Hampton Roads but there is some satisfaction in knowing that even with conditions entirely different from the previous year there will be a gain of at least a quarter of a million tons.

⁂

Trade Conditions and Tonnage at Baltimore, Md., during 1914

By W. R. Hough

SYNOPSIS—A year of uncertainty has been passed. A flat industrial situation strongly affected the bituminous trade. Anthracite operations were, however, firmer. In face of the fact that railroads showed a big falling off in general tonnage, 1914 was a banner year in the export movement of fuel from Baltimore.

A twelvemonth on the whole unsatisfactory, a period of poor demand and poor prices, a time of general uncertainty, closed with December. Whatever its causes a deepening feeling of depression swept over the industrial world here, as in other parts of the country, in January and February of 1914. Every effort was made by operators, shippers and dealers in general to stand firm. January contracts were entered into in good form despite the growing depression. The previous summer and early fall had seen a boom period in the coal trade—a period when the Great Lake region had taken the largest tonnage in its history and when other sections had been clamoring for fuel almost at any price at times. It was felt generally that things would brighten up, and in evidence of good faith along that line not a few contracts were entered into at better figures than at the same time the previous year.

Good times failed to materialize by the time that the general contracting season in April approached, however. Rate-decision delay and other causes were attributed for the growing business depression, but the fact remained that the coal trade had difficulty in maintaining contract rates on the old basis in not a few cases.

Things dragged, tonnage movement going from bad to worse, until the great European war suddenly sprang into existence in July. Then followed even greater uncertainty. Some held that business, and through it the coal trade, would be further demoralized; others that it would be a stimulus to American manufacturing. September saw a rush of export coal from this port; a rush that rolled close to 130,000 tons for the one month, and many thought these figures might be maintained. But the drop came again, and the year went out with the export trade about on a normal basis.

A feature of the early months of the year was the fact that many coal-property developments were made in Pennsylvania, West Virginia and Kentucky. Several local concerns were rushing development plans despite the decreasing demand. All seemed to feel that a resumption was coming. After mid-summer, however, a decided change took place. Development was largely stopped, and it soon became apparent that the market was over-stocked on soft coals even with the old production basis. Prices kept sliding. The last month of the year saw West Virginia gas coals selling generally below the dollar mark. Steam coals were on the same level. In Pennsylvania and Maryland similar conditions prevailed for the less desirable grades. Best coals were to be had by the trade at the mines at about $1.35. In order to keep up organization great quantities of fuel were disposed of at less than actual production cost. Cancellation of contracts during October and November proved most demoralizing. All in all it was one of the worst fall and early winter periods in the history of the bituminous trade.

Anthracite dealers had the same experience in a measure with industrial coals.

A bright spot was the export trade. While the government in November ordered that no more official export figures be given out at the close of monthly periods, it is learned that the total exports were approximately 966,000 tons over the local piers. This is a gain of nearly 100,000 tons over the export total of 1913. Italy, Cuba, Argentina, Mexico, Egypt, Greece and Spain, in the order named, were the largest takers of export coal. Greece and Argentina were to a considerable extent virgin territory, the coals being shipped to displace Welsh coals used formerly.

Most of this export coal came here over the Baltimore & Ohio R.R., showing one of the few features of gain by that road. On general coal haulage the Baltimore & Ohio totaled approximately 33,000,000 tons in 1914, against 35,000,000 the previous year, thus sustaining a loss of 2,000,000 tons.

The Baltimore & Ohio handled a total of a little more than 3,000,000 tons of fuel over the local piers—Curtis Bay and Locust Point—in 1914. This included nearly 1,000,000 tons of export coal, bunker fuels, and the general harbor delivery trade as differentiated from the all-rail deliveries at local yards. The Western Maryland R.R. handled approximately 600,000 tons and the Northern Central about 300,000 over the piers during the year, as far as can be ascertained from unofficial figures. It is estimated that the Northern Central sent to this city approximately 1,000,000 tons additional for all-rail delivery, mostly anthracite coal, and the Baltimore & Ohio about the same amount all-rail fuel, the larger portion being bituminous. This would bring the local total for all kinds of fuel, export, bunker both foreign and domestic, harbor delivery and all-rail close to the 6,000,000-ton mark.

There is one feature worth mentioning in summing up 1914—the trade enters 1915 confidently. All feel that the worst period is now over.

The 1914 Export Coal Trade

By F. R. Wadleigh

SYNOPSIS—The year 1914 was one of considerable importance in the American coal-export trade. A large tonnage has been shipped to Mediterranean countries which have heretofore taken little, if any, American fuel. Scarcity of ships available, high and fluctuating freight rates, and unsatisfactory banking and financial conditions especially in South America have combined to lessen the volume of coal exported during the latter part of the year.

The year 1914 is one that is likely to be long remembered by all persons interested in the exportation of coal For purposes of comparison it is advisable to divide our coal exports for both 1913 and 1914 into two six-month periods, as conditions before and after the European war was declared were entirely different.

Under normal conditions, as they existed at the close of 1913, the outlook was favorable to a considerable increase in our coal exports, especially in the Mediterranean countries. In Italy, actual contracts for quite large tonnages had been closed, principally for Hampton Roads and Baltimore coals, while a small but steady and increasing business was going on with South America.

This increased business is shown by the following table of coal exports:

UNITED STATES EXPORTS OF BITUMINOUS COAL FOR THE FIRST SIX MONTHS OF 1913 AND 1914—FROM HAMPTON ROADS, PHILADELPHIA AND BALTIMORE

Country	Long Tons 1913	Long Tons 1914	Increase
Italy	173,411	505,162	
France	16,145	40,922	
Austria	30,298	19,892	
Egypt	86,420	38,961	
Spain	37,270	38,665	
Africa	58,137	69,796	
Brazil	114,204	98,430	
Chili	71,001	26,591	
Argentine	27,728	94,721	
Uruaguay	......	33,804	
Cuba	692,293	532,605	
West Indies	277,831	274,727	
Mexico	187,742	61,786	
Central America	36,106	36,133	
Total (including other countries)	2,397,301	2,477,542	170,241

To	1913	1914
Europe	401,681	713,398
S. America	212,933	253,546
West Indies, C. America, Mexico	1,193,952	905,251

The decrease in the last group is due entirely to the disturbed condition in Mexico and a decreased consumption in Cuba.

To Canada, the largest buyer of our coal, exports, for various reasons, showed a marked decrease, as shown below.

U. S. EXPORTS TO CANADA, FIRST SIX MONTHS OF 1913 AND 1914

Anthracite 1913	Anthracite 1914	Bituminous 1913	Bituminous 1914
1,972,613	1,776,551	5,460,321	3,489,581

The last six months of the year have shown a considerable increase in our export coal trade, due largely to war conditions. This increase was not as great as would have been the case had ships been available; financial difficulties, terms of payment, etc., have deterred exporters from taking orders they were actually offered.

The temporary stopping of British coal exports brought in a flood of inquiries and orders for U. S. coals, but as soon as British coals were allowed to go forward, inquiries dropped off, especially as shipping rates from this country advanced at the same time and vessels became scarce.

The fact that there have been ample supplies of British coals available for export at all times since the export embargo was removed, has undoubtedly kept down our foreign sales. The prices of British coals were not raised, indeed they have actually been lowered on some of the best known coals.

Statistics of our exports are at hand only to Oct. 31 and these not in detail. For the first four months of the second period of the years under consideration, exports are as given below:

U. S. EXPORTS, BITUMINOUS COAL, JULY 1, to OCT. 31, 1913-1914

Destination	1913	1914
Argentina	34,149	113,183
Brazil	126,895	137,023
Uruaguay	......	38,015
Cuba	419,300	375,719
West Indies	246,429	235,440
Mexico	229,520	227,479
Other countries	416,379	836,585

U. S. EXPORTS TO CANADA, JULY 1 to OCT. 31, 1913-1914

Anthracite 1913	Anthracite 1914	Bituminous 1913	Bituminous 1914
1,567,723	1,575,015	6,202,145	4,731,886

It will be seen from the above that our exports to "other countries," under which are included all European countries and Chile, show an increase, during the four months of 100 per cent.; most of this increase is in shipments to Italy, notwithstanding high freights.

For the first six months of the year prices as quoted on the market, varied but little, from $2.80 to $3 f.o.b. Hampton Roads, for New River and Pocahontas. At Philadelphia, good steam coals were quoted at from $2.60 to $2.75 f.o.b. Baltimore coals were from $1.10 to $1.75 f.o.b. mines.

These prices generaly have varied little throughout the year, until recently. The U. S. Navy contract, closed in June, was at prices of $2.83 f.o.b. Hampton Roads and $2.65 f.o.b. Philadelphia. The Panama R.R. contract was just awarded to a Pocahontas shipper at $2.70 f.o.b. Hampton Roads; other bids on Pocahontas and New River coals were from $2.75 to $2.85 f.o.b.; Pennsylvania coals at $2.65 f.o.b. Philadelphia. Some Pocahontas & New River coals for export were sold as low as $2.70 f.o.b., with commissions included.

FREIGHTS ON COAL

To cover the variation in ocean freights and the causes for the great changes that took place would require more space than is available.

During the first part of the year freights were normal, with a downward tendency. The variations in chartering prices throughout the year is shown in the following table:

FREIGHT RATES DURING 1914

Destination	Jan.	Mar	May	June	July	Aug.	Sept.	Oct.	Nov.	Dec.
Buenos Aires	$3.64	$3.40	$3.28	$3.28	$3.16	$5.60	$4.86	$4.13	$4.01	$5.83
Rio de Janeiro	3.76	3.64	3.40	3.03	2.92	5.84	5.46	3.76	4.13	6.07
Alexandria	3.40	3.16	2.92	2.92	2.55			3.40		
Genoa and Naples	2.92	2.67	2.43	2.24	2.43		5.42	3.03	4.86	4.86

The last month of the year witnessed an unexampled rise in freights, the latest available quotations being as follows, on Dec. 22: To Buenos Aires, $6.07; Rio Janeiro, $5.50; Genoa and Naples, $8.40.

The scarcity of vessels for coal cargoes has induced the offer of high rates to the coastwise coal transportation companies for the use of their colliers; it has also brought about the entrance of schooners, usually engaged in coastwise traffic, into the export trade.

Some of the principal events affecting our export coal trade during 1914 may be chronicled as follows:

The completion of the two largest coal piers in the world, on Hampton Roads, has added greatly to our facilities for handling tidewater coal.

The European war, with its upsetting of all calculations, but with the assured effect of increasing our coal exports and expanding our markets.

The greatly increased interest of our coal companies in the export trade and its possibilities, as shown by the numerous investigators and salesmen sent out, as well as by the formation of at least one large company to handle export business.

The first avowed efforts of the U. S. Government's technical departments to assist our export coal trade; the opening of the Panama Canal; and the appointment of commercial attache's to six of our foreign embassies.

Worth noting also is the recently closed contract of the Egyptian State Railways for 120,000 tons of Welsh colliery screened ordinaries at $4 per metric ton (2204 lb.) f.o.b. (which at present freight rates, would be about $8.75 delivered); 60,000 tons of Fairmont double screened 1½-in. coal at $7.28 per ton delivered, 5000 tons of Island Creek (W. Va.) 1¼-in. coal at $6.68 per ton and 5000 tons of New River coal at $6.80, delivered. On the basis of present freights, it is not likely that the U. S. shippers will make any profit on these shipments.

On the whole, 1914 has been a most important year to U. S. coal exporters. The year's events have taught them much needed lessons regarding foreign markets for coal, the selling competition, the competitive coals and the needs and business methods of foreign countries; all this in addition to actual increases in tonnage that are likely to be permanent.

What effect the continuance of the European war will have on our coal exports is problematical. At present, Great Britain, our strongest competitor, has more than ample coal and labor to meet all demands both for home and export.

We cannot compete on anything like equal terms as to price, with the British coals, as long as ocean freights remain as they are now, with rates from Cardiff to Genoa at about $3.83 per ton as against about $8 from the U. S.; Cardiff to Buenos Aires $3.90; from U. S. $6.

Numerous inquiries for bids on large tonnages of export coal have been received since the beginning of the war; most of them turned out to be merely inquiries and led to no actual business.

However, our foreign coal shipments could have been largely increased had our exporters been willing to make delivered prices or to have given long credits; the lack of satisfactory banking and collection facilities were ample reasons for their unwillingness, together with the reported financial conditions in most of the foreign countries needing fuel, especially South America.

* *

Pittsburgh Coal and Connellsville Coke Markets in 1914

By B. E. V. Luty

SYNOPSIS—The year just past was, so far as concerned the coal market, the worst for a long time. With mines working far below capacity concessions from circular prices were frequent and heavy. The curtailment in the production of pig iron and steel products was reflected in a reduced coke output and unprofitable prices. Both coal and coke would receive a pronounced stimulus from a revival in the iron industry.

Throughout the Pittsburgh coal district the year 1914 was by all odds the worst for some time, presenting a sharp contrast with 1913, which was a season of heavy production and quite satisfactory prices. In 1914 prices were altogether unsatisfactory and the tonnage was light, the output being between 50 and 60 per cent. of nominal capacity, though probably less than 50 per cent. of that which could be produced with all physical conditions satisfactory.

The main cause for the coal trade being thus depressed was the poor industrial situation. The steel mills, upon which the Pittsburgh coal district largely depends for custom, did not operate at an average capacity of more than 60 per cent. during the year, while railroad consumption was materially curtailed and the Lake demand was altogether unsatisfactory.

For the low prices ruling in 1914 there was a contributory cause, namely, the settlement of the mining scale without a cessation of operations when consumers had expected a suspension. This, of course, did not alter the amount of coal produced or consumed in the year, but it upset a market that was already weak, so badly that no definite recovery occurred throughout the remainder of the year.

In 1914 a suspension was likewise expected, and stocks were laid in against it, but in addition to the settlement being reached four days before the termination of the old scale an arrangement was made whereby the miners were to remain at work during the taking of the referendum vote. As late as the beginning of September some operators were still attributing the light market demand to the fact that the stocks laid in prior to Apr. 1 had not been entirely consumed.

Nor did the anticipation of a suspension cause any particularly strong market during the period when stocks were being accumulated. The year opened with circular prices at 90c. for slack; nut, $1.15; mine-run, $1.30; ¾-in., $1.40; 1¼-in., $1.50, with a 10c. concession to dealers on screened coal, but these prices were frequently cut. In February the cutting became more pronounced and even in March the market was not altogether steady. In the first two months mining operations were at 50 to 60 per cent. of capacity, while in March they did not much exceed 75 per cent. In April demand was so light that operations dropped to an average of less than 50 per cent. and the only hope of the operators lay in the Lake trade.

This opened quite inauspiciously, little coal moving in May, and not much more in June. Month by month there was hope of an increase, as the Northwest was taking but little more than half as much coal as in the previous season, but navigation ended earlier than usual and with no better movement in its second half than in its first. Prices on Lake coal were all low.

Lake Coal Shipments in 1914

Shipments of coal to the Lakes in 1914 amounted to about 23,000,000 tons, a decrease of about 6,000,000 tons from 1913. The Pittsburgh district furnished 49 per cent. of the total, Ohio falling far behind its usual proportion, on account of the deadlock on system of wage payment.

The 1914 shipments, as compiled on excellent authority, with some minor estimates, were as follows, in tons of 2000 lb.:

	Cargo	Fuel	Total
Pittsburgh district	10,427,000	768,000	11,195,000
Other Pennsylvania districts	423,000	13,000	436,000
West Virginia	8,841,000	265,000	9,106,000
Ohio	1,263,000	100,000	1,363,000
Kentucky	886,000	9,000	895,000
Totals	21,842,000	1,154,000	22,996,000

The estimates made refer chiefly to the light shipments in December, mostly for winter storage.

Even before the Lake-shipping season closed $1.15 for mine-run was a high price, obtained only occasionally for the best grades of gas coal, but the cessation of Lake shipments did not demoralize the market to the extent that might have been expected, evidently for the reason that the limit had already been reached. Mine operations were reduced, and in the last two months of the year did not average more than about 40 per cent. of capacity.

How extremely bad the market situation was is illustrated by the so called "circular prices" announced late in the year. In 1912 the price announcement occurred Nov. 4, while in 1913 it was made on Oct. 1. The circular price for 1912 was $1.15 for mine-run, an advance to $1.22½ being announced in April, after the wage increase, while the fall circular carried an advance to $1.30. The announcement of Oct. 1, 1913, was of a 10c. advance to $1.40, but this increase did not hold even for a day. The circular price for 1914 was therefore $1.30, but it was scarcely obtained even in March. About Nov. 10 one of the larger operators made a price announcement of 85c. for slack, $1.05 for nut and slack, $1.15 for nut, $1.20 for mine-run, $1.30 for ¾-in. and $1.40 for 1¼-in., at the same time openly quoting 5c. a ton discount for prompt lots. These prices did not obtain, however, other operators preferring to maintain the figment of the old circular prices until such time as the market should improve and it might be possible to name prices that would be somewhat remunerative and would have a chance of being held.

Much of the Pittsburgh district coal that goes to nearby consumers is controlled by long-term contracts, the price being based on the mining rate. In the two largest contracts it is understood the rate with the present mining scale would be $1.12½, but while these contracts are supposed to be exceptionally favorable to the buyers it is doubtful whether in 1914 the shipments to other consumers, who buy from time to time, averaged much higher in price.

Connellsville Coke

Connellsville coke production in 1914 was light, while the prices realized were unsatisfactory. The output was about 14,000,000 tons, or the smallest since 1904, with the single exception of 1908. The average price realized was also the lowest since 1904 with the exceptions of 1908 and 1911.

As explained in this review a year ago, many of the Connellsville operations are heavily bonded, and in order to meet sinking-fund and interest charges a considerable portion of the price realized on coke must be set aside. The prices obtainable in 1914 did not, as a rule, provide sufficient margin for this purpose, and a curious feature of the trade was that many of the producers wh most needed revenue refused to sell at going prices an thus had particularly light operations, with the result tha their financial showings must have been extremely poor Little is publicly known of their financial statements o operations, but there is room for conjecture that ther were many defaults in interest payments. A few oper ating companies have been definitely forced to the wall being bought out by the bondholders.

CONNELLSVILLE COKE STATISTICS FOR 1914*

1914 Week Ending	Merchant Production	Furnace Production	Total Production	Shipments Cars	Shipments Tons
Jan. 1–3	49,803	62,131	111,934	2,952	109,912
Jan. 10	94,310	166,360	260,670	7,114	258,459
Jan. 17	95,852	172,505	268,357	7,286	264,784
Jan. 24	104,595	186,460	291,055	7,982	290,586
Jan. 31	99,110	201,945	301,055	8,203	298,541
Feb. 7	97,720	207,255	304,975	8,346	303,852
Feb. 14	101,290	198,960	300,250	8,230	300,301
Feb. 21	102,020	201,140	303,160	8,884	324,170
Feb. 28	108,390	205,480	313,870	9,388	341,784
Mar. 7	119,540	226,150	345,690	10,562	383,842
Mar. 14	122,805	230,600	353,405	10,410	377,045
Mar. 21	126,780	237,300	364,080	10,167	369,530
Mar. 28	127,507	232,511	360,018	9,587	347,490
Apr. 4	131,480	224,840	356,320	9,712	348,950
Apr. 11	130,750	223,975	354,725	9,695	348,411
Apr. 18	126,600	208,055	334,655	9,059	325,545
Apr. 25	125,452	188,305	313,757	8,628	310,209

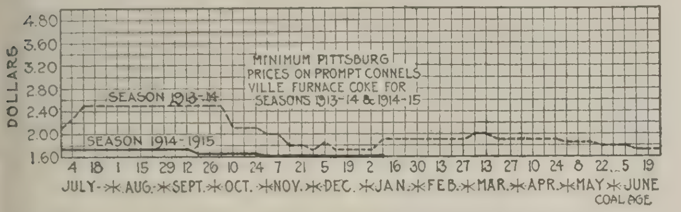
*From the "Weekly Courier."

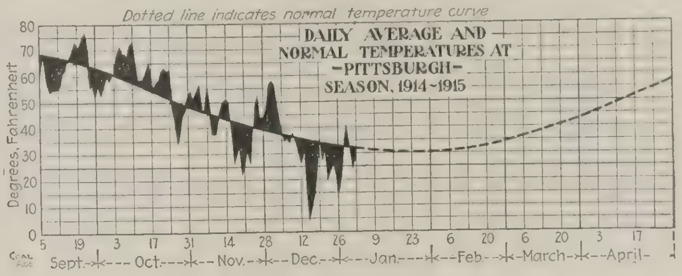
There are other Connellsville operations that were earl in the field, buying their coal acreage at relatively lov prices and making such profits in their early years as wipe out all obligations and leave them as net gain whatever margin there may be between the bare cost of production and the selling price. To such producers the year 1914 made quite profitable returns.

Late in December, 1913, some contracts for the first half of 1914 were closed at $2, a price higher than it had been thought would be obtained. Many consumers refused to pay this amount, and bought prompt coke from time to time to tide them over, eventually striking a lower average than $2. In June a distinct improvement in the steel trade caused a burst of confidence among buyers, and a few made contracts for the second half at $2. Others decided to buy from month to month, a course which later events made eminently satisfactory to them. Many of the contracts made for 1914 were not fully carried out, as they were the familiar requirement contracts, deliveries being based upon whether the furnace ran or not, and as pig-iron production was greatly curtailed the furnaces that had paid the highest prices for coke were the ones most likely to blow out.



While the prices realized were quite unsatisfactory to the heavily bonded operations, these requiring as a rule $2 or more in order to show a profit, prices at no time in 1914 were as low as they were in some previous years. Prompt coke usually sells at a lower price than contract coke. During the first half of 1914 prompt coke averaged fully $1.85, in the third quarter $1.70 and in the fourth quarter $1.60. Much lower prices for prompt furnace coke have frequently obtained, the market for several months in 1909 being $1.40 to $1.45, while the same level was held early in 1911. Toward the close of that year some contracts were made for a six-month period at $1.55 and $1.60, so that coke prices in 1914, while low, were not extremely so.

Some allowance should be made for the fact that a general wage advance was made early in 1913, so that costs were higher in 1914 than in earlier years. However, while the leading coke interest, the H. C. Frick Coke Co., a subsidiary of the Steel Corporation, adhered to the advanced wage scale, several of the merchant operators made reductions early in the year, and the supply of labor was so plentiful that they experienced practically no difficulty in obtaining men to work at lower rates than were being paid at the majority of plants.



Toward the close of 1914 there was a general contracting movement for the new year, the regular basis being $1.75, but in several instances there were slight cuts from this figure, still leaving the average of all contracts above $1.70. Nearly all the furnaces depending upon Connellsville coke purchased a supply during this period, except those that were out of blast—a very considerable proportion. These, of course, could not buy at the going market as it was recognized that they would not blow in unless general conditions greatly improved, in which event the coke would be worth more money.

Coal-Trade Conditions in Cleveland during 1914

By A. E. Cornell

SYNOPSIS—The season opened under fairly propitious circumstances. During the summer, however, Lake tonnage was decidedly less than in the previous year. At the present time manufacturing has been to a considerable extent resumed and market conditions are more favorable.

One year ago the coal trade in Cleveland and along the Great Lakes was closing a prosperous year. Prices had been profitable and shipping had been large. But under it all there was a feeling that the best had passed and the coming season would not be the "boom year" that 1913 had been.

Factories were running short of new work and an open winter was cutting into the business of the docks at all Upper Lake ports. By the time Lake shippers were ready to buy their 1914 requirements the markets were off and Lake coal sold at 10 to 15 cents below the prices of 1913. Although the central competitive states, Ohio, Indiana and Illinois, and western Pennsylvania were likely to stop producing temporarily while a wage contract was being drawn there was no anxiety over the supply of coal. The Upper Lake ports were so well stocked with fuel carried over that it was not likely there would be any need of new coal until June or July. At that time the local market was not using more than 60 per cent. of its normal requirements.

During the winter of 1913-1914 shippers had loaded vessels with close to 500,000 tons of coal and this was available at the opening of navigation, Apr. 15, should there be any necessity to rush it to the Northwest. It turned out that this storage was not needed until late in the season and in the latter part of October a cargo of Hocking loaded in the winter was delivered.

April, May, June and July shipments of Lake coal were much smaller than in 1913. In August, bituminous fuel going to Lake Superior passed the 2,000,000-ton mark for the first and only time during the season, while in 1913 these same docks received more than 2,000,000 tons during each of the five mid-summer months. Anthracite shipments showed large losses in April, May, August, September and October.

Based on the shipments of 1913 with scattered data for 1914, the Lake movement of bituminous coal, bunker and cargo, during the past year aggregated 21,850,000 tons, a decrease as compared with 1913 of 22.85 per cent. Anthracite shipments show a loss of 19.5 per cent., or an aggregate traffic of 4,052,000 tons.

The West Virginia Lake business is expected to show the smallest relative loss. None of the Ohio fields began shipping until mid-summer and shipments then were confined to Cambridge and Hocking. The No. 8 field of Ohio did not ship a pound of new coal in 1914. When No. 8 operators saw they could not expect to sell in the Lake market, they went to West Virginia and bought for their trade. This helped West Virginia to hold up better than Pittsburgh.

The large amount of coal left over on the Lake docks made it possible to restock them early in the fall. This precluded the necessity of paying extra freight to have boats deliver cargoes in late November and early December. Less than a half-dozen steamers received extra freight rates. A few cargoes of hard coal were moved in December at an advance of 10c. a ton and a few of the smaller docks on Lake Michigan paid a like advance, but boat owners were glad to get cargoes of coal at the contract rate regardless of the lateness of the season.

Independently of either the rate for mining proffered in the No. 8 district or the justice of the price asked by the miners, the screen-coal law has greatly injured the coal-mining industry in Ohio. The amount of fine coal produced has increased and its quality is inferior. The slack that has come into the Cleveland market during the last few months is less pure than formerly and consumers are not buying it whenever a better grade of fuel can be obtained at a reasonable figure. Ohio fine coal, produced under state jurisdiction through the industrial commission on the mine-run basis, is worth in the open market about 85 to 90 per cent. of what it was when lump mining was the standard. Ohio's advanced legislation has not advanced the coal-mining industry of the state, but has positively injured it.

Trade conditions of the last year in Cleveland have not been more than 50 per cent. of capacity. This has materially reduced the consumption and has been keenly felt by jobbers and operators. The first quarter of 1914 was the busiest of the year. Shops and factories were doing a fairly good business and the demand for coal was proportionate, with prices that were profitable. As the winter demand for heating and power fuel decreased, the summer trade showed little life and throughout the warm months Cleveland was the dumping ground for surplus coal from all fields. This is a consignment market to such an extent that it feels over-production more quickly than many large centers.

With the close of the lake season and the curtailment of production the market has not been so flooded with consignment coal as it was during the summer, but there is still too much fuel of this kind to make it a safe market in which to speculate. Industry has increased in Cleveland and the factories are now working on an average of 60 per cent.

During the last year about 3,410,000 tons of coal were brought into Cleveland. This is figured as consumption, though some of it has been reconsigned. In 1913, 4,061,583 tons were brought in and the local industries were accredited with using all of it. This shows that the decrease of consumption, due to the inactivity of local industry, was approximately 651,583 tons.

Market Conditions in Cincinnati in 1914

By Kenneth C. Cardwell

SYNOPSIS—Being largely a manufacturing city Cincinnati suffered keenly in the general depression. Competition in the coal trade forced prices far down and retailers secured heavy stocks at about $1 per ton. The market consequently did not respond when cold weather arrived. The present tone is optimistic and the trade is hopeful for a successful year in 1915.

Cincinnati, being one of the busiest manufacturing centers in the land, suffered with the rest of the country, and perhaps to an even greater extent than the average city, on account of the general dullness in business throughout 1914. Normally a large consumer of steam coal of all kinds, the inactivity among the numerous industries caused the amount of this fuel used to fall far below that of an average year; and, as usual, with an almost complete lack of demand, the anxiety of shippers to dispose of their product increased to a point where astonishing price concessions were made. This, also, as usual, failed to stimulate the market, but was responsible none the less for some extremely cheap fuel.

Toward the end of the year another result became visible, affecting the domestic trade. Desperate efforts to dispose of the prepared grades during a dull fall had the same effect upon prices as that already noted in the steam market; and not a few retailers in and around Cincinnati loaded up on bargain coal, purchased for about $1 a ton or a trifle more. The result was that the extremely cold weather of the latter part of December failed to stimulate business with the shippers to any appreciable extent, the retail trade being already supplied.

A rather remarkable consequence of the general business depression has been noted by several leading selling agencies, disposing of large volumes of coal for shippers. During the entire year, in consequence of the relative idleness of manufacturing concerns, the railroads have had ample equipment available at all times, and have been able to move cars with remarkable speed. The entire production of the mines could thus be rushed to the market. This has been largely responsible for the amount of distress coal disposed of, as well as for some unusually energetic selling work. Thus, the volume of business handled occasionally ran far above what might have been expected.

Business conditions which characterized the year as a whole made it quite impossible for the total volume of coal moving to and through this market to equal that of last year. The figures available on the subject show in every class of fuel, except anthracite, which is a small item, a decrease as compared with 1913, both in receipts and shipments. The figures for 1914 are up to Dec. 12 only, while those for 1913 are for the entire year. This will, however, not make a great amount of difference.

MOVEMENT OF COAL AND COKE, RAIL AND RIVER, CINCINNATI

	Received	Shipped
1913		
Bituminous (rail)	6,210,832 tons	4,466,406 tons
Coke (rail)	149,654 tons	87,070 tons
Anthracite (rail)	13,689 tons	6,782 tons
River	1,935,994 tons	225,587 tons
1914		
Bituminous (rail)	6,041,155 tons	4,192,204 tons
Coke (rail)	76,987 tons	33,127 tons
Anthracite (rail)	20,703 tons	16,007 tons
River	754,460 tons	190,016 tons

The marked decrease in the volume of river traffic was due largely to the fact that during the entire summer and for the greater part of the fall the Ohio River was so low that shipping was impossible, and no coal moved. After the spring rise no coal came down, either from Pittsburgh or from the Kanawha district, until December, when a heavy movement began, and continued until ice in the river stopped the traffic. Probably 200,000 tons were received in Cincinnati during December, while an equal amount passed down for the lower river ports.

In the general bituminous market, sales of nut and slack were reported as low as 15c. a ton, as compared with a normal price, for good gas and splint, of 75 to 80c. It is estimated that reductions from circular, through the season, averaged 20 to 25 per cent.; and while these were most marked in the steam grades, they were also to be observed in the domestic market.

This condition, naturally, had its effect on the renewal of contracts. While some large dealers were able to renew agreements with good customers at figures close to those of other years, it was inevitable that the keen competition for business should have a depressing effect on prices. It is probable, therefore, that an average reduction of 5 to 10c. a ton for steam coal, or about 10 per cent. prevailed in the closing of contracts for 1915.

The widespread labor troubles in the Ohio field, which still continue, have not affected this market in any perceptible degree. The same is true of the relatively lesser labor troubles in the Kanawha district. The temporary withdrawal from the market of certain sections in that field by reason of sporadic labor difficulties did not affect Cincinnati in the slightest degree; which goes far to show just how bad business was.

In spite of the exceedingly poor record of the past year, and the fact that as yet no change has taken place in the conditions responsible therefor the trade is rather more optimistically inclined than otherwise. Seasonable weather indicates that there will certainly be good business in the retail trade, and with the generally expected revival in manufacturing, and the apparent improvement in the steel and iron industry, not to mention railroad business, it is felt that steam business will also pick up, and that 1915 will be a good year in the coal trade.

* * *

General Conditions in Coal Trade in and about St. Louis in 1914

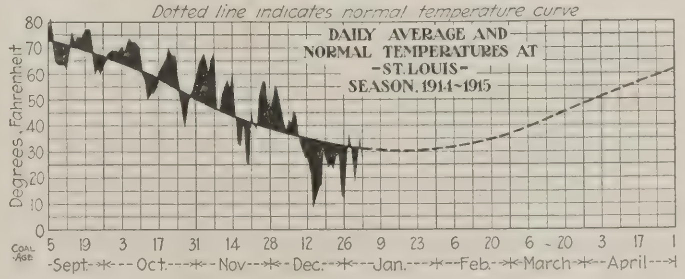
By E. J. Wallace

SYNOPSIS—Due to general industrial conditions many of the manufacturing plants in and about St. Louis were obliged to close down. This greatly decreased the consumption of steam coal. Mild weather, particularly during the early part of the year caused a light and uncertain demand for domestic fuel. Anthracite and smokeless coals have been largely displaced during the past season by gas-house and byproduct coke.

To the industries which look to southern Illinois for a large tonnage of steam coal, the year 1914 has been a failure. The principal reason for this is the fact that St. Louis is a large manufacturing center catering almost exclusively to the wants of railroads. These being unable to secure better freight rates and lacking sufficient working capital have not been in the market for any considerable quantities of material, and many of the largest plants in the city and vicinity have consequently closed down.

The European war, to a certain extent, has affected some of the chemical plants, while the general business depression and the difficulty of securing money from the banks for short periods has doubtless had its effect. The lumber business has been suffering throughout the entire season, while lead and zinc mining in southeast Missouri has not been developing its usual tonnage, and the iron and steel mills in and about St. Louis have experienced difficulty in holding their organizations together.

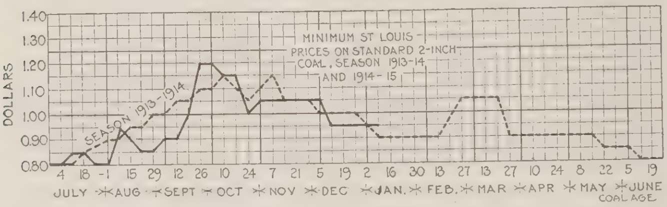
As a consequence operators in the southern Illinois fields have found that the past year brought them a decreased market in which to distribute their product. With nine idle mines out of a total of 34 in Williamson County, there was still an overproduction. One new mine was sunk by J. L. Mitchell, northwest of Johnston City, near the Franklin County line; one, the Oak Ridge, at Herrin, was closed during the year, and the Donnelly-Koen-



icke mine, at Cambria, was burned and abandoned and two or three others were partially dismantled. Williamson County tonnage will probably show a decrease for 1914, while Franklin County may reveal an increase. Saline County has shown but little change.

Financial troubles worried the operators in all fields throughout the season. In Perry County and in the Big Muddy field of Jackson County, there was practically no change, except that the year was a disappointment as far as the marketing of coal was concerned. In the Standard field, no new mines were opened, while a few of the older ones were abandoned. The tonnage from this field will likely show a decline.

But one serious disaster occurred during the year, namely that of Oct. 26, at Royalton, when an explosion killed 52 miners. There were a few minor accidents, but it is calculated that the total loss of life will be less than usual when the tonnage is considered. There were fewer petty grievances and strikes during the year than in the 12 months preceding, although every district had its troubles. Many operators have been handicapped by various miners leasing mines and operating them on a coöperative basis, selling the output for whatever the coal would bring and dividing the net returns among themselves. This became quite a serious matter during the summer months, and it is thought may develop trouble from now on, not only among the operators, but in the United Mine Workers of America.



So far as the local coal trade of St. Louis is concerned, the year 1914 opened with a slow market; prices were below normal for winter conditions, and were such on all grades of coal that the operators could only about break even on the cost of production. The first of the year saw weather colder than had prevailed up until that time, but not sufficiently severe to create a good market. Screenings were in fairly good demand at from 60c. to 65c. for Carterville and 45c. to 50c. for Standard. Domestic sizes were barely moving, Carterville and Franklin County lump averaging about $1.35 to 1.40, while nut brought $1.25 and mine-run $1.10. The winter was a warm one with little snow. This caused a light demand for domestic grades, and business conditions, instead of improving, apparently grew worse, resulting in a decreased demand for steam coal. There was no genuinely cold weather, excepting for a day or two, and this, of course, developed an unusual or spasmodic demand. Throughout January and Freburary, there was a tendency for a slight improvement in all grades of coal in anticipation of a suspension of mining on Apr. 1. This, however, failed to develop any noticeable strength, excepting in isolated cases in domestic sizes.

In the latter part of March, screenings brought as high as 85c. for Carterville and 80c. for Standard. Other coals were practically at the same level on Apr. 1 as they were at the beginning of the year. There was no demand for storage coal. This was a disastrous condition for several operators who had anticipated a rising market and an indefinite shut-down.

Throughout April, prices on screenings continued to advance, as much as $1 being paid for Carterville and 75c. for Standard. Throughout the summer months, the market was in a worse condition than in previous years on account of the financial inability of the public in general to lay in a winter's supply of coal as early as June or July. This held prices on domestic sizes down until August. Meanwhile a small tonnage of steam coal brought a fair price.

With the beginning of August, the demand for domestic sizes picked up, while that on steam sizes went in the opposite direction. The top of the market was reached for domestic coal in October, when Carterville and Franklin County 6-in. lump brought $1.75, and 2-in. lump from the Standard field sold for $1.15. The bottom of the screenings market was reached about this time, when Carterville slack was worth 15 to 20c. and Standard sold for the freight with a maximum of 5 cents.

For the bituminous shippers in the St. Louis market, the past year has been, with but few exceptions, an extremely unsatisfactory one. Many mines did not work at all, on account of mining conditions, while others which went into the hands of receivers were disposed of, but failed to operate. There was throughout the entire year, however, an optimistic belief that conditions would become better. This did not materialize for the shippers.

From the retailers' viewpoint, business was extremely good during the early part of the season, while the spring and summer were perhaps the dullest that the retail trade has ever experienced. Fall and winter developed the fact that there was a good tonnage of coal moving in small quantities, which increased the cost of delivery. There was an increased demand for Illinois coal during the past year, especially on the Carterville grade. This is caused, it is believed, principally on account of the desire for economy on the part of the consumers.

Anthracite, Smokeless and Coke

The year opened with but little demand for anthracite, but a considerable tonnage was sold during the latter part of March for April shipment at circular prices. Failure on the part of the consumers to move this tonnage brought a sudden end to anthracite shipping, with the result that independent coal started to move in at prices below circular. As a rule, this was of inferior quality.

The anthracite business revived in July and August, but the tonnage was apparently below that of previous years. This was probably largely on account of the extensive advertising of gas-house coke, which, to a large extent, is taking the place of anthracite and almost entirely displacing smokeless. The year closes with a poor anthracite market, caused by jobbers over-buying and shipping without orders, and in selling at from 25 to 35c. below circular with but little demand.

Smokeless lost, perhaps, one-half of its tonnage in the St. Louis market during the past year, on account of the introduction of gas-house coke above mentioned. This grade of coke brought in by the dealer cost on the track from $5.50 to $6 for byproduct and from $4.50 to $5 for gas-house. Local gas-house coke costs the dealer about $4 on the track, the consumer paying $5.75, delivered. There is a tendency on the part of the public, however, not to buy high-priced fuel. Illinois coals are, therefore, attracting some business that in the past went to anthracite, smokeless and coke.

The Year in Hard Coal

The Bureau of Anthracite Coal Statistics' record of shipments in the years 1911, 1913 and 1914, assuming that the shipments for December were equal to those of December a year ago, show 69,954,297 tons for the record year of 1911, 69,069,628 tons for 1913 and 68,302,961 tons for 1914. Thus the shipments in 1914 were 1,651,336 tons less than in 1911 and 766,667 tons less than last year. If the tonnage of the Lehigh & New England R.R. was included in the Bureau of Anthracite Statistics' figures, shipments in 1914 would probably exceed those of the previous year.

The decrease in production and shipments as compared with 1911 was due partly to the warm weather which curtailed demand this fall, partly to the recent drought in the anthracite region and partly to the continuation of the "button" and other strikes called in violation of the agreement between the operators and their employees signed in May, 1912. The output lost in these sporadic strikes would be more than enough to account for the difference in production in 1914 and 1913.

If the quantity of anthracite sold to local trade and employees be put at 3 per cent. of the shipments—a proportion that has held approximately, in recent years—then the total marketable output in 1914 was 70,352,050 tons, as compared with 72,052,926 tons in 1911 and 71,141,717 tons last year. This does not include the coal used in the operation of the mines themselves, which is equal to 12 per cent. of the quantity shipped.

⁂

The Labor Situation

SYNOPSIS—The evictions of miners in eastern Ohio are set for Jan. 15. J. S. Coxey of "army" fame is talking about operating a coöperative mine. The Union proposes to start tent colonies. In Colorado the U. S. troops are being withdrawn. In Arkansas the men at the Kali-Inla mine expect to strike. In West Virginia, the Central West Virginia Coal Operators' Association was formed Dec. 29.

The Ohio officials of the United Mine Workers of America are taking steps to fight the eviction orders of the Pursglove-Maher Coal Co., which were served last week. The date for the eviction is fixed at Jan. 15. A formal demand for the ten months' rent due the company from the men was made, and this was followed by the order to evict in case the rent was not forthcoming.

Some of the operators believe that the order of eviction is a prelude to an attempt to operate the mines on the "open shop" basis. So far no effort has been made to work the mines in that way. President W. R. Woodford, of the Pittsburgh Vein Operators' Association, is authority for the statement that the action of the Pursglove-Maher Coal Co. is of its own individual election and may not be followed by other eastern Ohio operators.

Most of them, however, are outspoken in the statement that they will not permit the miners to occupy their houses indefinitely without paying rent. The miners claim that the contract calls for the rent of their houses to be deducted from their wages, and that they cannot be evicted for nonpayment of rent, as they are quite willing to have deductions made as agreed.

Arbitration Is Sought through Department of Labor

The Board of Trade of Wheeling, W. Va., has taken action looking to the intervention of the Department of Labor in the strike situation. A committee from the board conferred with Congressman Francis, of Martins Ferry, and requested him to use his influence to have the matter arbitrated. Whether the Federal government will take such an action is a matter of conjecture.

It has been argued that the differences between miners and operators in eastern Ohio are wholly as to what constitutes an equality with the old scale, for both sides say they are willing to resume at the exact equivalent. However, neither side likes to leave the equivalency to arbitration.

One operator in Belmont County who has accepted temporarily the 47c. rate because he has to have coal for his own local use and, saving freight, can pay the price demanded, says that he finds the cost of mining has gone up 8.2 per cent., or is now 3.55c. per ton higher than under the old scale.

One of the remarkable things about the eastern Ohio situation is the fact that the international officers of the Union steadily refuse to allow the men to hold a referendum vote on the proposition of the operators. Ostensibly, the miners' organization strongly favors the principle of referendum voting, but it is being withheld at this time.

Annual State Convention in Ohio

Secretary-Treasurer G. W. Savage, of District No. 6, United Mine Workers of America, has issued a call for the annual state convention to meet at Columbus, Ohio, Tuesday, Jan. 12, in the state capitol building. The local unions elected delegates this week. The new governor, Frank B. Willis, will be inaugurated Monday, Jan. 11.

It is said that the Union is preparing to purchase tents to house the strikers, and will buy 35,000 shoes for their use and for the use of their families.

General Jacob S. Coxey, who sprang into national fame a few years ago by marching an "army" of unemployed to Washington, D. C., and demanding work, plans to operate a mine in the eastern Ohio field on the coöperative plan. He proposes to lease a large tract of undeveloped property and organize a company among the miners. This proposition is not regarded seriously by most of the coal operators.

New Bache-Denman Development

The recent hearing in the federal court as to the cancellation of the coal leases held by the Bache-Denman and other allied coal companies, showed that the Kali-Inla coal mine near Adamson, Okla., still belonged to the Bache-Denman Co., or its directors. This mine is worked by 350 union miners. They have, hitherto, believed the plant was not owned by any of the Bache-Denman syndicate, or they would have struck work out of sympathy with the men who have been laid off in the mines which Franklin Bache has been trying to run nonunion. It is probable that they will go on strike now, as it was attested in the hearing that the alleged purchaser, Walter J. Gilman, a mining engineer, of Philadelphia, Penn., was not then, and never was, the owner of the Kali-Inla properties with which he was credited.

Troops Withdrawing from Colorado

Troop L of the Twelfth U. S. Cavalry has been on patrol duty in the Oak Creek district of Routt County, Colo., since last May. This is a part of Colorado in which not much trouble has been experienced, though some disorder was apparent at times. The town is, roughly, 240 miles in a straight line northwest of Ludlow. The troop will return to Fort Meade, S. D. It is expected that other troops will soon be relieved from service.

The Central West Virginia Coal Operators' Association

On Dec. 29 the Central West Virginia Coal Operators' Association was organized with the following objects:

First, the conservation of coal properties by improved methods for mining coal. Second, the provision of the best, safest and most approved methods of mining coal and the safeguarding of miners and other employees engaged in such pursuit.

The counties represented in the association are: Marion, Harrison, Monongalia, Lewis, Taylor, Barbour, Preston, Braxton, Randolph, Upshur, Mineral, Tucker, and Gilmer. There were 43 companies represented at the meeting. The directors are as follows: Harrison County, A. Lessirurang, J. Edgar Lang and Daniel Howard; Marion County, George T. Watson, C. H. Jenkins and [illegible]. M. Hite; Mineral and Grant Counties, J. G. Boyd; Tucker County, A. W. Calloway; Gilmer, Randolph and Braxton Counties, R. B. Isner; Upshur, Taylor and Barbour Counties, Lee Sandridge, I. B. Brydon and David Williamson; Monongalia and Preston Counties, T. W. Borgman and Davis Elkins.

The officers are: President, Daniel Howard, of Clarksburg; vice-president, C. H. Jenkins, of Fairmont; secretary, A. Lile White, of Clarksburg; treasurer, C. J. Ryan, of Hepzibah. An executive board consisting of five members will be elected from the directors. This will be done at a future meeting of the association to be held soon. A working secretary will be elected to take charge of the central office, which will probably be located at Clarksburg.

Extracts from a Superintendent's Diary

My wife's brother-in-law, a resident of New York City, has been spending a few days with us, incidentally giving us an opportunity to find out what city folk think of coal-mining men. We have had many interesting conversations during his short visit, but probably the most illuminating one occurred last night when we launched out on the subject of mine guards.

Earlier in the evening, one of my foremen had dropped in to discuss the advisability of employing a guard for our creek pumping station, the plant from which all of our water-supply is obtained, and my relative happened to overhear the conversation.

A strike has not been declared against us as yet, but a few incidents have occurred which leave small doubt as to the intentions of the Union, and to leave unguarded a place where one man could easily put our entire plant out of commission with a single stick of dynamite seems too much like tempting fate. Our pumper reported last night that as he was starting for home he saw two strangers watching his movements from a distance. It was that report that brought the mine foreman to my house for a conference.

Some time after the foreman had gone my city visitor led up in a roundabout way to the conversation he had overheard. Because of his evident embarrassment, I pretended not to connect his questions with my foreman's visit, but awaited a favorable opportunity to speak out.

First he wanted to know if I approved of private citizens carrying concealed weapons. I assured him that I did not. "But why?" came next. To which I replied that they were capable of transforming a peaceable citizen into a formidable fire-eater.

Then he became nervous, apparently, fearing that I had connected the question and he wandered far afield, but finally came back with: "Why should an individual or a corporation assume that police powers can be exercised by anyone at will?" By way of answer I asked him to explain why a man suddenly confronted by a bitter enemy carelessly displaying a gun pointed his way, should assume that he had a right to defend himself.

I didn't get a direct answer, but his next question showed that my reply had not been exactly satisfactory.

"Why do mine guards always exasperate the union pickets around them until they feel compelled to give battle?" I was tempted to tell him that they never did, and such stories were generally circulated for a purpose, but I feared that he would consider my testimony as prejudiced, so I suggested that they were probably anxious to commit suicide.

My sarcasm missed fire completely because he immediately wanted to know why the mining companies picked such desperate men for the work when men who valued their lives would avoid such uncalled for clashes. I assured him that men of unquestioned humility were always given the preference when considering applicants, but for some reason men of that type no longer seemed to aspire to such positions.

Again I missed fire for he suggested that newspapers so often intimated that the union men were the aggressors in battles with mine guards and probably a good many people were thus led to believe that union men were quarrelsome and for that reason men of quiet dispositions hesitated about coming in contact with them; or again, they might fear that after accepting positions as mine guards, some of the union men might intimate to them that they were casting their lot with the wrong side and then they would be sorely troubled as to just what course to pursue, since they must choose between scab and traitor.

I have heard of people laughing in their sleeve; now I know that it is quite possible.

※

West Virginia's Mining Population

An interesting report, which has just been compiled at the West Virginia Department of Mines, is that giving the nationalities of the coal miners employed in the state, wherein the total mining population of West Virginia is given at 78,041, of which 49,458 are American (white and colored) and 28,583 are foreigners. Of the foreign-born miners the Italians lead with 10,276, while one Dane and one Hebrew are at the bottom of the list. They are classified as follows:

Americans (white).....	36,101	Horwat (Croatians)....	430
Americans (colored)...	13,357	Syrians	115
Italian	10,276	Croatians	115
Hungarian	4,761	Bohemians	89
Polish	3,136	Servians	60
Slavish	2,229	French	46
Russian	1,737	Turks	45
Austrian	1,472	Swedes	21
German	577	Bulgarians	12
Greek	571	Welsh	11
English	557	Montenegrins	10
Roumanian	510	Belgians	8
Granish	149	Danish	1
Lithuanians	414	Hebrew	1
Litvitch	389	Unknown	188
Scotch	221		
Irish	202		78,041
Spanish	230		

It is interesting to note that the four counties of McDowell, Fayette, Mercer and Raleigh, in which the smokeless fields are located, have a mining population of 38,279, or nearly half of the entire mining population of the state. McDowell leads with 16,558, of which 10,487 are Americans and 6071 foreigners; Fayette with 12,651—9257 Americans and 3394 foreigners; Raleigh with 5644—3787 Americans and 1857 foreigners; Mercer with 3426—2651 Americans and 775 foreigners. Other counties with large mining populations are Kanawha, with a total of 7460—6252 Americans and 1208 foreigners; Harrison with 5288—2136 Americans and 3152 foreigners; Marion with 5702—1902 Americans and 3800 foreigners; and Logan with 4820—2960 Americans and 1860 foreigners.

The remaining 16,492 of the mining population are divided among the counties of Tucker, Barbour, Boone, Braxton, Brooke, Clay, Gilmer, Grant, Greenbrier, Lewis, Lincoln, Marshall, Mason, Mineral, Mingo, Monongalia, Nicholas, Ohio, Preston, Putnam, Randolph, Taylor, Upshur, Wyoming and Wayne.

※

The Development of the Coke Industry

The Iron Trade Review has compiled the following interesting history of the coke industry:

100 B. C.—It appears that the Chinese used coke as an article of commerce some two thousand years ago, and in the middle ages it was manufactured for use in the arts and for domestic purposes.

1620 A. D.—This is the earliest record that we have of coking coal in a regular oven, when a patent was granted to Sir William St. John, in England, for making coke in a beehive form of oven.

1700—J. Becher, a German chemist, took out a patent to save tar from coking coal, and to utilize it for preserving ropes and wood.

1737—Clayton, of England, appears to have been the first to notice that in addition to coal tar and oils, a combustible gas was formed when coking coal.

1781—A patent was issued to the Earl of Dundonald for making coke in beehive ovens, and also for producing "tar, pitch, essential oils, volatile alkali, mineral salts, etc." which appears to be one of the early, fairly successful attempts at saving the byproducts.

1792—William Murdock, a Scotchman, who was a mechanical engineer, associated with James Watt in steam-engine building, is recorded as being one of the first to experiment successfully with making gas from coal, in retorts.

1812—The streets of London were first lighted by gas, presumably an outcome of Murdock's experiments.

1826—We find the first definite records of beehive coke being manufactured in England on a fairly large scale for metallurgical purposes.

1830—The first records of the rectangular, or retort, oven are found in Germany, having open walls, forming a rectangular space which contained the charge. The walls were pierced by horizontal and vertical flues.

1834—The first gas from retorts in the United States was made, together with gas coke, and William Firmstone, in 1835, made good gray forge iron at the Mary Ann furnace, in Huntington County, Penn., from Broad Top coal.

1841—The first Connellsville coke ovens are said to have been erected and the coke shipped to Cincinnati, Ohio, by water.

1857—In this year Appolt built his first ovens in the shape of vertical and later horizontal retorts. He utilized his gas only for heating his oven through horizontal flues. This represents practically the first type of closed retort coke oven, utilizing the gas for its own heating.

1861—Coppee built the first of his Belgian type of ovens, and was the first to demand the use of crushed coal.

1893—The first battery of byproduct ovens in the United States was built at Syracuse, N. Y.

Statistics of the byproduct coke production from 1893 to date are as follows:

Year	No. of Ovens		Coal Used Short Tons	Coke Produced, Short Tons	Yield of Coal in Coke Per Cent.
	Built	Building			
1893	12	....	....	12,850	....
1894	12	60	....	16,500	....
1895	72	60	....	18,521	....
1896	160	120	....	83,038	....
1897	280	240	....	261,912	....
1898	520	500	....	294,445	....
1899	1020	65	....	906,534	....
1900	1085	1096	....	1,075,727	....
1901	1165	1533	....	1,179,900	....
1902	1663	1346	....	1,403,588	....
1903	1956	1335	....	1,882,394	....

1905	3103	417	4,628,891	3,462,348	74.8
1906	3547	112	6,193,107	4,558,127	73.6
1907	3684	330	7,506,174	5,607,899	75
1908	3799	240	5,699,058	4,201,226	73.7
1909	3989	949	8,390,129	6,254,644	74.5
1910	4078	1200	9,529,042	7,138,734	74.9
1911	4624	698	10,446,584	7,847,845	75.1
1912	5061	1000	14,731,310	11,048,489	75.0
1913	6781	536	16,952,533	12,714,700	75.0

⁂

Kentucky Compensation Invalid

By a vote of four to three, the justices of the Court of Appeals of Kentucky have decided that the Workmen's Compensation Act, which would have become effective Jan. 1, 1915, violates the Constitution of that state, and is void so far as it may be interpreted as coercing employers and employees into coming under it. The Court of Appeals approves a proper form of Compensation, but holds that, since employers and employees would be virtually compelled to be governed by the provisions of the Kentucky Act, as framed by the last legislature of that state, it is void. The court finds two principal objections to the law: (1) It limits the amount recoverable for injuries due to negligence of an employer, and (2) it takes from the estate of a workman killed in the course of employment, if he leaves no dependent relatives, part of the award payable for the accident, and provides for the payment thereof into a fund from which other employees injured may draw. The Court of Appeals intimates that an employment contract might validly provide for a limitation of the amount recoverable against the employer in case of accident, but finds that the proposed compensation law would have unconstitutionally coerced employees into accepting less compensation for their injuries than the damage actually sustained.

The effect of this decision will doubtless be to defer, if not totally defeat, the final adoption of an enforceable compensation law in Kentucky. In other states, the action of the Court of Appeals will afford a strong precedent for the overthrow of similar laws which have not yet been submitted to the judicial test.

⁂

Decrease in Shipments over the Virginian Railway

A statement of the Virginian Ry. tonnage for the 10 months of 1914, compared with 10 months last year, shows a decrease of 371,500 tons, or nearly 10 per cent. The shipments for the last two years by months were as follows:

Month	1913	1914
January	453,886	407,109
February	399,267	259,756
March	380,091	336,952
April	345,039	342,843
May	318,720	359,929
June	304,030	321,181
July	321 626	286,354
August	376,083	361,900
September	393,190	379,113
October	476,482	341,703
Total	3,768,424	3,396,840

Dumpings over the pier at Sewalls Point during October decreased 65,865 tons, or 18.3 per cent., while for the 10 months of 1914 there was a decrease of 273,665 tons, or 10.2 per cent., compared with same period of 1913.

⁂

Government Indorses Electric Shotfiring Systems

F. R. Lane, the Secretary of the Interior Department, on the recommendation of the Commissioner of Indian Affairs and of the Director of the Bureau of Mines, has affirmed the order of May 4, 1914. This order required the use of permissible explosives in coal and asphalt mines on the segregated lands of the Choctaw and Chickasha Nations in Oklahoma, but it granted that if electric shotfiring systems were installed, operated from without the mine, nonpermissible explosives might be used. The date set for the order to go into effect was Jan. 1, 1915.

The department issued the following statement:

> This order was issued with the two-fold purpose of increasing the health and safety of miners, and protecting the property interests of the Indian lessors against damages by mine explosions or mine fires, and by the terms thereof, was made effective Aug. 1, 1914. The order was later suspended until Jan. 1, 1915, so as to afford opportunity for demonstrations of permissible explosives in Oklahoma by engineers of the Bureau of Mines and for investigations into the use of electric shotfiring systems with especial reference to the conditions in Oklahoma.
>
> In the interval between Aug. 1, and the present date, the Bureau of Mines conducted demonstrations in some 12 typical coal-mining operations out of the 44 coal mines on segregated lands, and made an exhaustive study of electric shotfiring systems. At the conclusion of these field demonstrations, a conference was called at Pittsburgh, Penn., on Nov. 30, for the purpose of permitting the miners and operators to present concretely such objections as they might have to the enforce-

ment of the order. The matter was quite fully discussed at that time, but as both the operators and miners failed to submit the facts upon which their objections were based, they were given until Dec. 15, in which to submit their views in writing. These statements have now been received and have been carefully examined.

After a thorough consideration of this order in all its bearings, as regards miners, operators and Indian lessors, it is ordered that the same be made effective Jan. 1, 1915, and that the representatives of both operators and miners be advised at once that the Bureau of Mines, through its local representative at McAlester, Okla., will receive and act upon individual applications from the operators, for an extension of time within which to take steps to comply with the terms of such order. A liberal time will be allowed for this purpose so that no undue hardship will be imposed.

REASON FOR GRANTING OPERATORS FURTHER TIME TO COMPLY

This recommendation is based upon the following considerations:

(1) The depressed financial condition makes it difficult for the coal companies to raise any large amount of money at the present time for the purpose of installing mining machines, such installation being necessary if permissible explosives are to be used to the best advantage.

(2) Electric power is not available at present to many of the operators and it will necessarily take some time before suitable arrangements to this end can be made.

(3) The operators on segregated lands are subject to keen competition with the coal produced in the nonunion mines of Arkansas and Colorado, where mining costs are lower, and also with the coal mines in Oklahoma on the nonsegregated lands which are peculiarly favored in respect to absence of gas and better working conditions. The market for the coal produced from the segregated land is also much restricted by reason of great increases in the production of oil and natural gas in Oklahoma, with which, on the score of cheapness and efficiency in use, coal cannot compete.

(4) The change in explosives will probably compel a readjustment of the understanding with the miners with reference to working conditions, and a reasonable time would be permitted for the working out of satisfactory arrangements, in order that undue hardship may not be caused to either side, and that the royalty returns to the Indians may not be reduced.

A Safety Organization in the South

The coal companies of the South have shown a strong tendency to come together and promote better conditions in the mining camps, while in sanitary improvement Alabama has been a leader. There is now an effort to put the safety campaign on an equally satisfactory footing.

Ninety-eight operators, superintendents, physicians, and others met in Birmingham, Ala., and formed a safety association with E. B. Sutton, a mining engineer of the Bureau of Mines in Birmingham, Ala., as president, Jones G. Moore, manager of mines, Sloss-Sheffield Steel & Iron Co., as first vice-president and Dr. M. W. Glasgow, as secretary. It has not been decided yet whether affiliation will be sought with the American Mine Safety Association, though such an alliance would be of mutual benefit.

The Human Element

Written Expressly for
COAL AGE

By MICHAEL BERNARD

WILL meander in with a silly grin.

YOU may spend your cash by the hundreds.

THIS safety scheme is a wonder
  For the sparing of pain and hurt
To the men who pick where the gloom lies thick
  On the walls of coal and dirt;
But the thing is a piece of rubbish
  And a standing joke, besides,
If the chaps who read will refuse to heed
  The rules that the plan provides.

IF you furnish signs by the dozen,
  And you plaster them all about,
Telling plain and clear that there's "*Danger Here!*"
  With the warning words "KEEP OUT!"
Yet some boob with an upper story
  Like a cue-ball fringed with hair,
Will meander in with a silly grin
  To discover why they're there.

YOU can purchase countless devices
  Of the automatic kind,
As the spring and pawl to prevent the fall
  Of a cage in an overwind,
But they're put at a disadvantage,
  And their service is often vain,
For there's little hope when they have to cope
  With a man with a two-ounce brain.

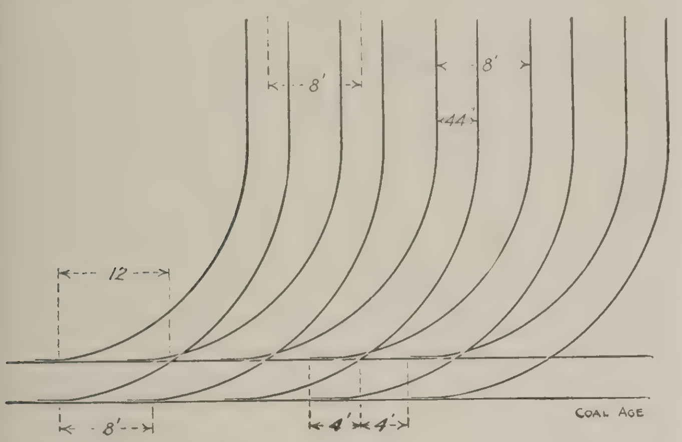
YOU can spend your cash by the hundreds
  For the saving of life and limb,
Putting shields of steel over gear and wheel,
  And a guard at the pit-mouth's rim;
Yet in spite of your strict precautions,
  And spite of your utmost care,
Some befuddled bum with a load of rum
  Will fall into trouble there.

° ° °

SO it's not a matter of posters to admonish or to remind,
  Nor of safety tools, nor of books of rules, but it's all of these things combined.
It's a matter of education by picture and printer's ink,
  And the only way is to work and pray till the toilers have learned to think.

An Economical Switch Arrangement

The accompanying illustration shows how a number of switches may be laid to secure a maximum economy of space. In the figure it will be noted that five complete switches, with a track gage of 44 in., and each having a lead of 12 ft., take up an entire distance of only 48 ft., where ordinarily 72 ft. would be required.



Plan Showing Switches

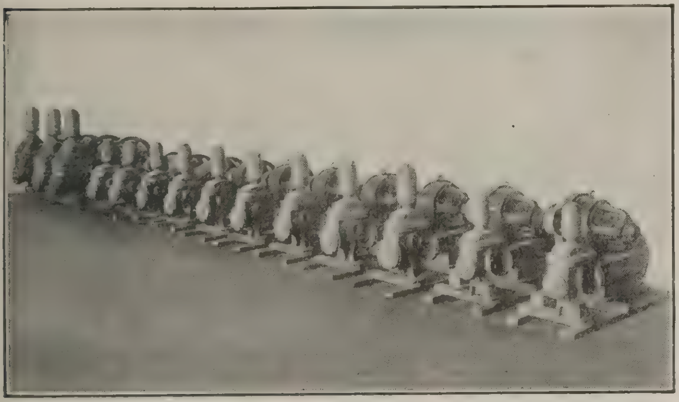
The arrangement as here shown is used by the Preston County Coke Co., at Cascade, W. Va., and is employed for the purpose of running locomotives into the motor barn. This building may, therefore, be constructed with a minimum of length and breadth.

※

A Motor-Driven Mine Pump

The accompanying illustration shows a group of motor-driven pumps developed specially for sump and gathering service in coal mines.

These pumps, which were built by the Weinman Pump Manufacturing Co. of Columbus, Ohio, have brass-lined water cylinders, with bronze piston rods, bronze valve seats, stems, springs, stuffing-box caps and glands, and bronze adjustable cross-head shoes, so that they are thoroughly protected against the action of mine water.



One Shipment of Weinman Pumps

The motors are direct-current Westinghouse machines and are mounted on top of the pump, where they are kept out of the water. They are supplied with impregnated windings, which afford protection from dampness. A special feature is the use of automatic control by which the pump can be started and stopped from any convenient point.

The unit formed by motor and pump is very compact and is readily mounted on a truck so that it can be easily transported from place to place as needed. The group shown is a lot ready for shipment one week after receipt of order.

※

A New Form of Concrete Timbering

Mr. H. Otten, Essen, Germany, describes in *Gluckauf*, Sept. 5, 1914, some successful trials of reinforced-concrete timbering made by the Frankfort Concrete Construction Co., Ltd., which overcomes the obvious objections to concrete supports made in the gallery itself. The first trial was made in 1909, in the Kronprinz pit at Ensdorf, Saar district, the gallery lined being about 75 ft. long. Although the results were satisfactory in every respect, so far as concerned the stability of the structure, there was scaling at the joints when the structure was pushed sideways by the earth pressure. Like efforts were shown in a crosscutting, about 100 ft. long, lined in 1910. After a lapse of four years, it was found that the structures showed weakness at the joints only.

This experience suggested a change in the design. The caps were recessed to receive the rounded ends of the props, making a knuckle joint, and a cork inlay about an inch thick was set between the two surfaces, to distribute the pressure evenly, and so that the concrete surfaces should not bear one on the other. This new construction allows side movement without weakening the stability of the structure.

In January, 1910, a gallery about 50 ft. long was provided with this latter form of timbering, which was set on cement blocks, and the work turned out very well. The timbering yielded sufficiently to the rock pressure without a sign of crumbling at the bearing. A brick lining laid in this gallery at the same time was badly crushed.

Following this trial, a gallery in the Dudweiler pit, which was subject to the greatest pressure to be found, was timbered with 220 of these frames, with entire satisfaction to the owners.

Further experiments were made in the pit Preussen II, of the Harpen Mining Co., in the lowest level, where there was unusual pressure accompanied by springs in the seams. Both uprights and cross pieces in this mine have withstood the pressure after two years' exposure Previously this gangway had been lined several times with iron frames, which had quickly given way by the contraction of the cross-section.

These experiments show that this method of timbering is thoroughly practical, and in addition is fireproof.

※

Status of Mine Examiners as Employees—Under the provision of the Illinois constitution which requires the legislature to provide for the safety of "operative miners," and under the laws of that state which require crosscuts to be closed in certain cases, an assistant mine examiner, who was injured by explosion of accumulated gases in a mine which he was examining, cannot recover on the theory of a violation of the laws by the operator. Any common law right of recovery was absent in this case on account of a showing on the part of the operator that plaintiff was inexcusably careless in making the examination of the mine with an open lamp. (Havron vs. Shoal Creek Coal Co., 184 Illinois Appellate Court Reports 117.)

Editorials

When Should Rescue Work Be Abandoned?

There has been some discussion recently relative to the extent or duration of rescue work following a serious mine accident. One engineer calls attention to the numerous instances where more men have been lost in the subsequent rescue operations than perished in the initial disaster. The Cadeby explosion in England was an example of such a case.

On the other hand, there are many instances of accidents where men were given up for lost, and yet have been rescued. Not long ago, after a serious mine accident, the local mine inspector stated definitely that no more men could be alive in the workings, however, his assumption was proved false for one of the entombed miners was able to drag himself to the shaft and thereby bring about the rescue of his comrades. Just think what would have happened in such a case if the mine had been closed down.

In this kind of problem, each individual holocust must be accepted as its own guide. There is plenty of room for the exercise of extreme caution, however, it would be unfortunate to induce a state of mind making it possible for the acknowledged bravery of the mining community to go out of fashion.

⁂

An Industry Renewed

A subtle change has come over all our methods of reasoning on social problems—and it has come to stay. It has its origin in new conditions, but they are so permanent in character that we cannot look for any changes for two or three generations.

Years ago the people in any American village were very much alike. None were extremely rich; all spoke English fluently though some were perhaps foreign and spoke with a brogue. They all lived as one community, took part in the same celebrations, attended the same church, eschewed or were enslaved by the same vices.

If there were differences among them, the "different" people moved away, and the bond among those remaining was rendered still stronger. The people, thus bonded together, had no disagreements and grew remarkably in culture. The better educated and the richer did not move away. Their aspirations and their living refinements penetrated through the communities; their private lives were matters of daily discussion.

But the entrance of non-English-speaking foreigners, the growth of wealth, the lure of the cities, soon broke up the unity of village life, especially in those hamlets built like mining towns to order. No longer could there be a hope of rising culture. In fact, as the early Anglo-Saxon element in Tennessee has been subdued by the mountains, so, in too many cases, have our American people been pushed into squalor by an over-close association with southern Europeans, who came to America, not to live with us a life in accordance with their ideals, but to barely exist with us, that they might secure for themselves their ideal life in the village from which they came.

It was evident that mining life rose in the scale of culture but slowly and perhaps tended to retrograde What was good in the early camp was being fast driven out. The young men—the sons of the miners of former days—were leaving. As the towns became unattractive, drunkenness and lawlessness increased and reacted one on the other.

And, as a result, the mining industry has been blamed and a change has come at last. We no longer think we are exonerated if large wages are paid and but small profits are secured. It would be better to pay less wages if a little better mode of life could be assured, if the saloon and the game of poker could be despoiled of some of their ill-gotten gains, and a little more could be put into home comforts and health, wholesome food and decent clothing, a garden, a playground and a better school.

It is useless to say that this country recognizes the individual, gives him a vote and looks to *him* to provide for his betterment, seeing that it has been abundantly shown that it is not true that he seeks to improve his condition. It has been proved again and again that, given ordinary conditions, the citizens of a mining town with a large percentage of southeastern Europeans, unless there is some system of segregation or some attempt at supervision, or some encouragement toward betterment, will not improve at all from year to year, and may notably decline in culture as years go by.

It is increasingly clear, also, that the more enterprising people, even those connected with the mines in an official capacity, are tending to leave the mining town and live outside. So there can be no solution in *laissez faire*. We must act definitely if we would keep conditions even at their present level.

But it does not follow that we need imitate foreign models, or at least not those in favor on the Continent of Europe. There is no reason why we cannot seek to build up our communities on the basis of individual thrift and sobriety. Every man can own his own house and have his own lot, can have his share in a bank, his bank account, his certificates of stock, and can contribute to the cost of local movements, filling also political offices of various kinds. All that is needed is the inculcation of ideas and the provision of opportunities.

Coöperative stores are proving successful in Illinois. Many of the towns in that state are filled with the residences of miners, privately owned. The sidewalks are usually of concrete. The lots are kept scrupulously clean, and the lawns are carefully kept. There is every evidence of thrift. Many of the Young Mens' Christian Associations and similar institutions even in proprietary towns are already being directed by the miners with marked success.

There is no reason why greater strides are not possible. But some coal companies are so indifferent that even their own offices are dirty and disreputable in appearnce; the mine surroundings and the railroad tracks ave a demoralized look; the streets have never been graded or crowned, and the alighting place, called a tation, is of repellant appearance.

Some of the operators who disdain the careless *ménage* of their workmen and tenants are themselves equally regardless of the appearance of their own works, and the untidy interiors of their power and boiler houses make it impossible for them to find fault with their workingmen.

Who Gets the Promotion?

Replies to the Cartoon problem printed in Coal Age Dec. 26, and entitled, "Who Gets the Promotion?" have been received in such number that we will be obliged to publish them in abstract. A few of the answers—those selected by the judges as of greatest value—will be printed in full.

Because of the unusual and widespread interest this question has aroused, we have decided to submit the replies of our readers to five competent judges. Each of the three men in the cartoon has his advocates, and it is remarkable how different are the opinions.

Many of those who have answered the question as to what they would do if they were the boss, are really bosses themselves, and we wonder how many of these men have actually had to decide a similar case in real life.

At any rate, the problem is an interesting one, for it will tend to bring out strongly the essentials in character that are likely to be of value to an individual in advancing his sphere of usefulness. Every miner, fireboss and foreman should set aside time to read this discussion when it appears (probably next week), and the more successful men filling higher positions may with advantage read the opinions of others on this subject.

As stated at the time the cartoon was published, the discussion will close Jan. 9, and any letters received thereafter will not be entered in the contest. In all cases where we have not been requested to withhold the writer's name, same will be published with his answer.

The Eastern Ohio Strike

We trust that the strike in eastern Ohio, which has already lasted nine months, will not be extended for many weeks into the new year. We would like to see the miners *win* in a real sense and obtain annual wages equal almost to those in other states in the Union. It does not follow, though, that better wages will be obtained if the rate for machine-mined run-of-mine coal becomes 47c. per ton. The number of days worked in the year will alone determine whether that, or any other wage thereabout, will afford a good annual compensation.

In the State of Indiana is an instance of this fact. The beds of "block coal" and those the Indiana people persist in calling "bituminous"—as if the "block" were not also comprehended in the same title—are alike comparatively flat. There is perhaps little other than more careful handling to make the labor cost of block coal $1.55 a ton, while that of bituminous coal is only 89c. The difference is in the wage scale.

Yet the annual wage of a block-coal employee was only $476.09, while that of the "bituminous" worker was $691.47—so large a factor is the number of days worked in determining wages.

It will be found by referring to E. W. Parker's interesting figures that in Ohio the average number of days worked per year from 1908-1913, inclusive, was 190. In the same period the Pennsylvania worker secured 238 days, or 25 per cent. more time. We do not believe in dividing wages by three to secure a half more working time, but it does seem that to attain 25 per cent. more day's labor, it is worth while to concede a little on the wage rate, when every evidence shows that the prevailing rate is now so high as to exclude the coal from the market.

Certainly, seeing that in that state there is already such an irregularity of work, it is ill-advised for any of the Ohio miners to ask an increase in wage rate. It is disingenuous for the eastern Ohio employees to declare that they are seeking only for last year's equivalent. They know quite well they are not, and that the operators in the southern part of the state conceded to the demands of the miners promptly, because the proposition made was a decrease in the mining rate of their region and an increase in the rate formerly ruling in the districts of their rivals.

Let the miners think twice. A doctor or a lawyer can set his rates as high as he pleases. However, if he sets them too high, he will get no practice. The "practice" of the eastern Ohio miners is similarly forfeited by their determination to secure a higher rate of pay than the market is able to concede.

The War Toll in the Staff of European Coal-Mining Companies

The coal industry in Germany, Austria, Belgium and France would seem to be suffering a disproportionately heavy death loss among its professional members.

At the recent annual meeting of an important German coal company, a letter was read from the general manager, regretting that as he had been called to the front, he would not be able to preside as chairman. The notice of this meeting concluded with the statement that in spite of the fact that the war "had torn great holes in the management," so far none of the company officials had been killed.

In Germany and Austria, the mining engineer is a government officer. His studies are made in government schools. He must stand official examinations, and rank and title are given to him, defining accurately each step as he advances in his career. The system is military in general form. Quite naturally, then, the government takes from these ranks the officers for the reserve army, which is called into existence by the declaration of war.

In the first weeks of the war, before the losses had reached the present appalling figures, there were numerous private death notices in the German dailies, and it was surprising how many had fallen who had been connected with the staff of the coal-mining industry. Latterly, these notices have become less frequent, but even among these there are indications of the heavy loss borne by the coal corporations. For instance, a Rhenish coal company announces in a single notice the loss of three members of its official staff.

A long continued conflict will certainly place a heavy handicap on the warring nations through this enormous loss of men engaged in the engineering professions.

Legal Department

Termination of Coal Leases

By A. L. H. Street*

Several interesting and important legal phases bearing upon a coal-mine lessee's liability for minimum royalties were involved in the recent case of Ellis vs. Cricket Coal Co., 148 Southwestern Reporter 887, which was passed upon by the Iowa Supreme Court. The lease in this case bound defendant to continue operations "for a period of 20 years or until all the merchantable and minable coal in said mine has been exhausted," and provided for the payment of a minimum monthly royalty during the life of the contract. Operations and payment of the royalties having been suspended, plaintiff, the lessor, brought suit to recover payments claimed by him to be due, and defendant interposed a defense that all the "merchantable and minable" coal had been removed. In sustaining this defense, the Supreme Court decided these points:

The burden was on the lessor to show that merchantable and minable coal remained in place, and not upon the lessee to disprove that fact.

Coal in place is "merchantable" within such a lease when it is of such quality as to be salable on the market, and it is "minable" when it is so situated that it can be removed at a reasonable profit. "As bearing on the minable character of coal, its accessibility, the condition of the earth over it, the interference by water, whether free from or mixed with other substances, must be taken into account and where removal as an article of commerce is contemplated, the cost of mining and bringing the coal to the surface is a controlling consideration." The cost of excavating the places of refuge along the haulageways, required by statute, is properly considered in determining whether the coal is minable at a reasonable profit.

In this case it appeared that a railway company afforded the only market for the coal that might be produced from the mine. Therefore, the question whether the coal could be produced at such profit as to be "minable" must be determined by the prices paid by this railway company, and not by general market values.

Recent Judicial Decisions

Discrimination in Switching Charges—The Interstate Commerce Commission has power to prohibit two railway companies from continuing a practice at a given point in switching cars of coal between their lines at a low rate, while imposing a prohibitive rate for switching cars to and from the line of a third company. (United States District Court for the Middle District of Tennessee, Louisville & Nashville R.R., Co. vs. United States, 216 Federal Reporter 672.)

Operator's Liability for Defective Cutting Machine—The provisions of the Pennsylvania Mine Foreman Law do not relieve an operator from liability for injury to an employee, due to a defective condition of an electric cutting machine which had been negligently permitted to remain in a dangerous condition after the mine boss had notice thereof, it appearing that the mine foreman had nothing to do with the machine. (Rau vs. Pittsburg-Buffalo Co., 54 Pennsylvania Superior Court Reports 579.)

Burden of Proof in Personal Injury Cases—In a suit by an employee against a coal operator for injury, resulting from a defect in an appliance, the burden is on the former to show that a defect was negligently permitted to exist and that it was the direct cause of the accident. An employer cannot be held responsible for injury received by a worker at a defective machine, unless it appears that the employer or his representative had actual or constructive knowledge of the defect. (West Virginia Supreme Court of Appeals, Vance vs. Virginia Pocahontas Coal Co., 82 Southeastern Reporter 1081.)

Employment of Minors—The statutes of Pennsylvania forbid employment of boys under fifteen years of age in oiling machinery, regardless of whether the machinery is in motion or not. Where a certificate for the employment of a minor mis-stated his age as being less than fifteen, and the father's signature thereto was forged, the father and the boy could recover damages for injuries sustained by the boy while oiling machinery, it appearing that the father had no knowledge as to the nature of the employment. (Hrabchak vs. Delaware & Hudson Co., 54 Pennsylvania Superior Court Reports 626.)

Engineer as Fellow Servant of Miner—For the purpose of applying the rule of law that an employer is not liable for injury to an employee caused by negligence of a "fellow servant," an engineer of a hoist engine of a colliery is the fellow servant of a miner, exonerating the employing operator from liability for injury to the latter caused by negligence of the former in controlling the movement of a cage; the engineer being bound to conform to the signals given him and having no powers of superintendence. (Golien vs. Susquehanna Coal Co., 54 Pennsylvania Superior Court Reports 299.)

Operator's Duty to Timberman—Damages not Excessive—An Illinois mine operator's statutory duty to examine mine roofs, mark dangerous places and make entry thereof in books, is not obviated by the fact that the mine manager, a licensed mine examiner, informs a timberman of dangerous places in the mine, and directs the latter to make them safe. $4500 was not excessive recovery for injury to a timberman, caused by fall of rock from a roof, where he was confined to his home for several weeks, and was severely injured about the hips, abdomen and kidneys, and was unable to work. (Wilson vs. Danville Collieries Coal Co., 184 Illinois Appellate Court Reports 180.)

Operator's Liability for Neglecting Mine Ventilation—In a suit against a coal operator in which an employee recovered $1000 for injury to his health which he claimed was caused by the operator's failure to ventilate the mine as required by state law, it is held that the miner cannot be deemed to have assumed the risk incident to remaining at work in a badly ventilated place, unless the danger was so imminent that a reasonably prudent miner would not have continued work there. It is further decided that the fact that plaintiff may have driven a shaft ahead of the airway was no bar to his recovery; the management of the mine being under the operator's and not plaintiff's control. (Kentucky Court of Appeals, Log Mountain Coal Co. vs. Crunkleton, 169 Southwestern Reporter 692.)

Exchange of Corporate Shares for Property—Under the laws of Missouri where a domestic coal corporation issues stock in payment for property, the property must be fairly equal in value to the par value of the stock issued therefor; otherwise the stockholders receiving such shares will be held liable for the excess of the par value of the stock above the value of the property to creditors of the corporation who in good faith relied on an assumption that full value was paid for the stock in assets held by the company. And, on this point, it is immaterial whether the exchange of stock for property worth less than the value of the stock was free from actual fraud on the part of the stockholders. Creditors of a corporation, in the absence of information to the contrary, are entitled to rely upon the company having the full amount of its capital stock in money, or its equivalent value. (United States District Court, Southern District of New York; Babbitt vs. Read; 215 Federal Reporter 395.)

Discussion By Readers

Mining Laws, Legislation and Mine Regulations

Letter No. 18—Referring to Letter No. 11, **Coal Age**, Dec. 19, p. 996, permit me to say that "Wesvania" evidently did not read my letter thoroughly or grasp my ideas on lobbying. It was my purpose, in my previous letter, to explain the necessity of having representatives before Congress or state legislatures, not for the purpose of exerting an undue influence, but to have these representatives explain to the legislators the status of the coal business and the needs of the industry, in an intelligent manner.

I am glad to learn of the satisfactory working of the West Virginia Compensation Act, as I believe that a collective plan of compensation is far preferable to the carrying of insurance by individuals; provided, of course, that all companies are obliged to maintain a certain standard in their mining operations. If such a standard is not insisted upon, a careless operator will profit by the expenditures of those complying with the law.

Carl Scholz, President,
Coal Valley Mining Co.

Chicago, Ill.

Letter No. 19—No one who is familiar with mines and mining can doubt that glaring errors have been made in drafting the laws of the different states. Nor can there be any doubt regarding the fact that legislators are generally unfamiliar with the industries which the laws they make will govern.

Mining men as a rule do not take an active interest in the enactment of the laws that are to govern the industry. Why this is so would be hard to explain, but it has been the writer's privilege to remark this indifference in many cases. The making of laws is something that the miner and every official, from fireboss to general manager, is often willing to let the outsiders manage.

At this point, I would ask, is there any industry under the sun that an outsider, as a rule—the men who make laws and the general public—know so little about? The ordinary industrial worker takes even less interest in the means whereby he is kept warm and his factory wheels kept moving, than mining men take in mining laws. They, perhaps, know more than the young lady who when visiting a mining camp and hearing the owner of the mine order a few bales of hay to be sent down, asked if that was for the miners to eat.

To the average outsider the details of a mine, if not repellent, are at least not fascinating. Visitors are frequently met in the steel mills, factories and other working places, and naturally become more or less familiar with the general aspects of the industries they visit, including the conditions under which the men work. But, except in such cases as the wholesale slaughter of a mine full of men, or such a condition as has occurred recently in West Virginia and Colorado, the public evinces little or no interest in the miner or his work.

This lack of interest creates a dearth of definite and accurate information that shows itself in our mine laws, which are too often vague in meaning and practically useless for the purpose intended. As stated in a well written article by "Mining Engineer," **Coal Age**, Dec. 12, p. 958, "In many cases, the law has worked an unjust burden on the operator." Recalling what the mine-run law, enacted in a neighboring state some time ago, has done for the miners and their families, owing to the utter impossibility for mine operators to operate under its conditions, I would add to this statement—an unnecessary burden on the miners as well.

But after all is said and done, what we need in and about the mines today—and this applies to several different mining states—is a spirit of obedience to the law as it exists, rather than additional laws. Let us manifest a genuine desire to carry on our work in accordance with the laws' intent. During the past three years, my work has taken me into nine or ten different states where mining of one sort or another is carried on, and into a great many mines in each of these states. This work being particularly the seeking out of danger to life and property, experience has taught me that no matter whether it be in the coal mines of West Virginia, Pennsylvania or Ohio, or in the iron-ore mines of the Northwest or any other field, the mines that are operated in the safest manner are those where the management is more concerned with taking all reasonable precautions, and adopts the safe course even if it be a little more troublesome, instead of hunting for loopholes to avoid the law, or lamenting the existence of a law which, in the manager's opinion, is an injustice and an unnecessary burden; where the management, in short, goes ahead with a determination to not only conform with the law but to "play safe," whether the law says so or not. I am glad to say that this spirit is found not only in the conduct of the larger corporations, but in less pretentious operations as well.

Were our state mining laws as extended and voluminous as a "Webster's Unabridged," I venture to say each of us could find something that had thoughtlessly been omitted. And, regardless of the complete detail of the mining laws, the management of each mine would still require individual rules of their own that would need to be enforced quite as rigorously as the general code, if the mine is to be operated as safely as possible.

My own personal experience forces me to conclude that the degree of safety, at any mine, depends to a large extent on the attitude of the management toward the idea of safety above all other considerations. Such an attitude thoroughly impregnated in the daily work of the superintendent and the foreman means more than is generally understood. Given my choice between a mine with good natural conditions in respect to roof, gas, etc., but a management indifferent toward safety details in its operation; and a mine where the natural conditions were adverse, but the superintendent and foreman willing and anxious to "play safe," I would take my chances, as a workman, in the latter mine.

In the letter to which I have referred, "Mining Engineer" takes exception to the law requiring boreholes to be kept in advance of the work in virgin coal. Perhaps the wording of this law should have been more explicit, or authority have been given to state mine inspectors to use discretion in its application, as it would seem a needless expense to drive holes in advance of an entry that has been cut around by other work; yet, we who have had to do with the driving of narrow work, in the solid part of the gaseous Pittsburgh seam, know full well that many serious accidents, costly fires and explosions have been avoided by the very fact deplored by "Mining Engineer." The drilling ahead of the work to locate gassy clay veins and thereby tap and drain off the gas gradually is the safe method to adopt in such formations.

Sim C. Reynolds, Safety Inspector,
Aetna Life Insurance Co.

Houston, Penn.

⁂

The Verner Counter-Current Theory

Letter No. 14—I cannot refrain from commenting on Mr. Verner's last letter, No. 12, Coal Age, Nov. 7, p. 761, in which he states: "I have faith to believe, however, that eventually the theory of the counter current will win out and be shown to have a practical value in respect to the prevention of explosions."

The most notable feature, in this letter, is that Mr. Verner has, himself, entirely failed to show how such "prevention of explosions" can be brought about, in the practical application of his theory, which is, after all, but a restatement of what has always been understood as the natural result of the cooling of the heated gases of the explosion and the condensation of vapors.

The quotation from Dr. Wheeler's letter, on the same page, by "An Interested Reader," shows that there was no inrush of air when the gallery in which the explosion took place was opened at both ends. This is the case in the Bruceton experimental mine; and it is probably due to that fact that those in charge of the Bruceton experiments gave no attention to the counter-current theory.

The inrush of air, such as was in evidence in the experiment performed by Dr. Wheeler for Mr. Dean, can only be obtained in an entry where there is a dead-end; as, for example, in a rock tunnel. In such cases the dust conditions are not present wherever, as in usual mining practice, there is an intake and return airway, and the conditions required by the Verner theory are not possible. It was owing to this fact, as noted in my last letter, the cinematographs taken during the entire time occupied by an experimental coal-dust explosion, at Altofts, showed that no counter-current occurred, in that case, until the explosion was complete and the blast had exhausted itself and condensation had set in, causing the well known vacuum stage.

The point I wish to emphasize is that, in dealing with the danger of a coal-dust explosion, we must consider the initial moment when the explosion takes place. At this initial moment, there is no possibility of a counter-current being present. If this is true, the counter-current theory does not furnish the desired solution of the dust explosion, as Mr. Verner claims.

I would suggest, in closing, that it would be well if Mr. Verner would make a close study of the Mt. Kembla explosion, which occurred in New South Wales, in 1902. He will find there more evidence of what he is pleased to style "counter-current," than in any other disaster with which I am acquainted. I would add that the term "counter-current," as used by Mr. Verner, is only another expression for "vacuum effect," as applied to mine explosions. The one cannot occur without the other being present; and it follows logically that the vacuum theory, in respect to mine explosions, is the correct expression and not counter-current.

James Ashworth,
Consulting Mining Engineer.

Vancouver, B. C., Canada.

⁂

Ignition of Coal in Storage

Referring to Mr. Hyde's inquiry, Coal Age, Nov. 14, p. 802, it might be of interest to him to know that the Federal Bureau of Mines has recently issued a bulletin dealing with the subject of the spontaneous combustion of coal. As has already been explained, in the answer to this inquiry, on the same page, and as shown by the experiments referred to in the Bureau of Mines bulletin, spontaneous combustion is readily caused by oxidation, which is greatly increased by the absorption of the oxygen of the air by the coal.

The rate of oxidation naturally increases with the rising temperature of the coal, and the most readily oxidized coals seem to be the most inflammable. Although the idea would not be accepted by many, careful tests and experiments have shown that the tendency to ignite spontaneously does not depend so much on the quantity of volatile matter contained in the coal as on the quality of the coal itself.

Some coals have the property of disintegrating more rapidly than others, which renders them more subject to oxidation by the constant exposure of fresh surfaces to the air. This fact was clearly demonstrated while work on the Panama Canal was in progress, by the observed tendency of the coal to fire spontaneously in the storage bins. The coal, in that case, contained only 17 or 18 per cent. of volatile combustible matter. Strange as it may seem, there are cases on record of much trouble and property loss resulting from the spontaneous combustion of cinders stored under buildings, in close proximity to some sort of external heat.

In order to reduce the tendency of coals to fire spontaneously, in storage, it has been suggested to store large quantities of coal under water. This method of storage was adopted a few years ago, by the Western Electric Co. at their Hawthorne plant, in Illinois, where they built a storage pit of concrete, 15 ft. deep, which covered nearly an acre of ground and had a capacity of 10,000 tons of coal that could be covered with water by flooding the pit. In general, however, the plan of storing coal under water is not practicable. The Federal Bureau of Mines offers the following suggestions for storing large quantities of coal. Some of these suggestions are admittedly impracticable. They are as follows:

1. Do not store in piles over 12 ft. deep, nor so that any point in the interior will be over 10 ft. from an air-cooled surface.
2. If possible, store only screen coal, as slack presents a much larger surface to the air.
3. Keep out dust as much as possible.
4. Pile so that the lump and fine coal are distributed as evenly as possible, not allowing the lumps to roll down the sides of the pile and form air passages at the bottom.

5. Rehandle and screen, after two months, if possible.
6. Do not store near an external source of heat even though that be moderate. Some coals will absorb from 12 to 13 times as much oxygen at a temperature of 100 deg. C., as at 40 deg. C.
7. Allow six weeks for seasoning, after mining, before storing.
8. Avoid alternate wetting and drying.
9. Avoid admission of air to interior of piles, through interstices around foreign objects, such as timbers, brickwork, etc.; or through porous bottoms, such as coarse cinder.
10. Do not try to ventilate by pipes, or more harm than good may be done.

CHEMIST.

Method of Working Underlying Coal Seam

Letter No. 6—It seems to me that the letters that have discussed Mr. Lyman's proposition of working an underlying seam of coal, COAL AGE, Aug. 29, p. 357, have ignored the fact that there was an abandoned seam of coal 40 ft. above the one it is proposed to work.

Mr. Lyman explains that there were frequent caves in the upper seam. Where this is the case, experience has taught me that large blocks of coal, and sometimes whole sections of pillars are abandoned and lost. It may be inferred from Mr. Lyman's statement that such is the case in the overlying seam, which makes it more difficult to contend with successfully.

However, the mining laws of most coal-producing states require all mine owners, agents, superintendents and operators to furnish an accurate map of the workings of the mine, to be filed with the state department. If such a map, in this case, is available and uptodate, it should show the correct condition in the overlying seam. In opening and developing this seam, I would locate all entries, crosscuts, room pillars and stumps directly underneath those in the seam above, as shown by the map. I consider this to be necessary in working all such underlying seams.

The plan suggested by Mr. Lyman of driving the entries to the boundary, and mining out the coal on the retreating system is good. But, I would suggest that there are few properties where it is not possible to mine some coal while driving entries to the boundary line. This plan would help to reduce the expense sheet, while developing the mine. In some cases, the plan is adopted of working a portion of the mine on the advancing system, while another portion is worked on the retreating system, in long wall. In that case, the advancing section is usually driven to the rise and the retreating section to the dip of the seam.

Should there be much gas or water in the upper seam, I would sink boreholes from the surface to drain off the gas. The water could be drained into the lower seam, if necessary, by drilling holes up, in the roof, to tap the water in the overlying seam, which could then be conducted to the main sump and pumped to the surface.

There are many instances on record where mines have been ruined and, in some cases, lives lost, by a haphazard method of mining seams of coal underlying worked out and abandoned mines. An instance occurred recently in West Virginia, where it cost the owners over $100,000 to put the mine in a fairly safe condition for work again. This could all be avoided by carefully planning the mine so that the pillars in the lower seam will come directly under those in the upper seam.

MINE FOREMAN.

Rock Forge, W. Va.

Methods of Working in Indiana

Letter No. 2—I desire to reply to the letter of Theodore Brent, COAL AGE, Nov. 14, p. 800. Mr. Brent says that I "failed to understand" the conditions with which they and other Indiana operators must contend. I venture to point out that he does not reply to the statements made in my article entitled "Storage-Battery Locomotives at the Grant Mine" (COAL AGE, Oct. 10, p. 576), but seems to criticize the mental attitude with which he unjustly credits me.

I fully realize that, as he says, it is unfair to criticize the present management of mines for improper mining, seeing that the Union, the legislature, the market and the forbears of the present operators are all partly to blame. In fact, my article put undue stress on the first two. The early operators who habituated their men to undesirable methods of mining are equally to blame. But I cannot hope to curry favor with the living by abusing their ancestors.

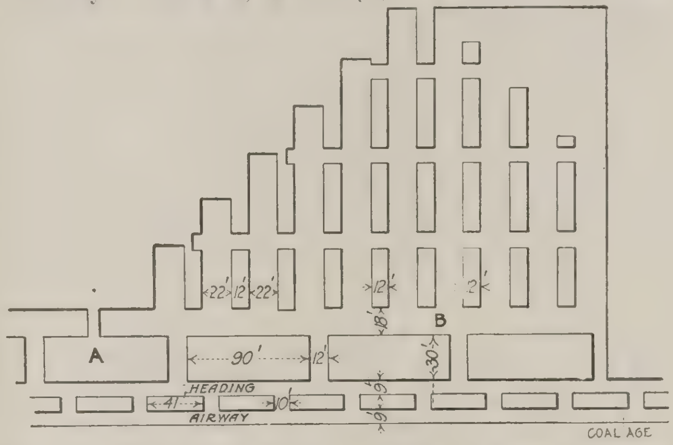

FIG. 1. SUGGESTED MINING PLAN TO MEET INDIANA SCALE CONDITIONS

If Mr. Brent will read the article carefully he will find my remarks were really addressed to those who believe Indiana afflicted with a roof of inordinately pernicious qualities. I said these difficulties could be met if the remedies applied elsewhere were introduced in Indiana; but I was careful not to assert that adequate changes should be made without large modifications in the economic situation. To say that a structural condition can only be met by the adoption of such and such a method is quite different from saying that such a method will pay.

I presume that it is useless to argue in favor of a narrower room and wider pillar in Indiana mines. Breakthroughs must be paid for at entry prices, and, to comply with the Indiana law, they must be made every 45 ft. If made 18 ft. wide they weaken the room materially. I have, however, increased the thickness of the room pillars from 9 to 12 ft. in the accompanying plan (Fig. 1), which I recommend. Moreover, it is not safe to advocate a long roomneck unless a compensation for the increased cost it causes is suggested. Unfortunately, the Union's scale says, with willful plainness, that roomnecks are to be 12 ft. long, and any distance in excess shall be paid for proportionately, but no roomneck shall exceed 15 ft. in length. Consequently, the only recourse is to pay crosscut rates for roomnecks and make them a safe length and save money by reducing their number and by economies in the length of the chain-pillar breakthroughs, as conditions may permit.

To accomplish this, I suggest an arrangement (Fig. 1), which gives one roomneck to three rooms and unbroken flanking pillars 30x90 ft. in size. The chain-pillars are small; but with due care in driving they will serve the main purpose, which is that of ventilation, and not support. The roadway *B* (Fig. 1) is driven about 18 ft. wide and, to meet the excessive demands of the law relative to ventilation, it is driven both ways to meet, as shown at *A*.

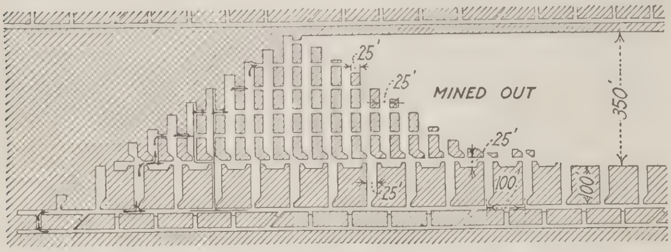

FIG. 2. SECTION OF MINE ILLUSTRATING THE "MAIN LINE" OR "ALTOONA" SYSTEM

This follows the scheme (Fig. 2) known as the "Main Line" (of the Pennsylvania R.R.) or the "Altoona" system. However, the ribs here are weaker than it is customary to allow around Altoona, where the flanking pillars are about 100 ft. square and where the roomnecks are themselves practically rooms, and even the haulage way *B* is narrowed at suitable places. To make this more clear, I have reproduced the system as illustrated by W. A. Silliman, at the Indiana (Penn.) meeting of the Coal Mining Institute of America, in 1911.

Finally, I do not wish to infer that the suggested plan will adequately meet the situation. It looks to me far more likely to be safe than that now in use, but perhaps it may have to be improved by a strengthening of the flanking pillars and possibly by a lengthening of the rooms so as to provide a better break than is afforded by short rooms.

Mr. Brent's remarks on the storage-battery locomotive require no answer. If he will read my article again, without inherent animus, he will conclude that my attitude toward the new form of tractive power is no less favorable than his own.

R. DAWSON HALL.

Study Course in Coal Mining

By J. T. BEARD

The Coal Age Pocket Book

Size of Discharge Pipe—In order to avoid excessive frictional loss due to high velocity of water in the discharge pipe, it is customary, in mining practice, to estimate the necessary diameter (d_c) of the column pipe, for any given discharge (G), in gallons per minute, by assuming a velocity of 400 ft. per min., which gives the formula

$$d_c = \sqrt{\frac{231\,G}{0.7854\,(400 \times 12)}} = 0.25\sqrt{G}$$

Size of Suction Pipe—For the same reason as stated in regard to the discharge pipe, it is customary to estimate the necessary diameter (d_s) of the suction pipe, in inches, for any given discharge (G), in gallons per minute, and a velocity of 200 ft. per min., which gives the formula

$$d_s = \sqrt{\frac{231\,G}{0.7854\,(200 \times 12)}} = 0.35\sqrt{G}$$

Example—In order to avoid excessive frictional losses in the discharge and suction pipes of a pump, what should be the minimum diameter of these pipes, respectively, if the pump has a capacity of 250 gal. per min.?

Solution—The minimum diameter of the discharge or column pipe for this pump should be

$$d_c = 0.25\sqrt{G} = 0.25\sqrt{250} = say\ 4\ in.$$

Likewise, the minimum diameter of the suction pipe should be

$$d_s = 0.35\sqrt{G} = 0.35\sqrt{250} = 5.5,\ say\ 6\ in.$$

Sizes of Pipes—The sizes of pipes are designated by their diameters, which, however, are only nominal, as they do not indicate the exact diameter of the bore. For example, the inner diameter of a 1½-in. pipe is 1.61 in.; that of a 2-in. pipe, 2.067, etc. The outer diameters are always greater by twice the thickness of the pipe. Some of the larger sizes of pipe are made in different weights of metal, thereby providing a greater or less thickness of wall, for the same bore. Pipe sizes above five inches vary by inches and above 16 in. by two inches.

Standard Pipe—What is known as the "Briggs standard" is a list of pipe sizes, giving the thickness of pipe for different internal diameters. This original standard has since been modified by pipe manufacturers to suit varying demands. The term "standard" therefore has a significance determined by trade agreements.

Dimensions, Weight and Capacity of Pipes—The table on the following page is compiled and carefully calculated from the data given in the National Tube Co.'s Handbook, 1913. It shows the nominal inner diameter, or trade sizes of pipes, together with the actual inside and outside diameters; sectional area of bore; inner rubbing surface and external surface of pipe, per 100 lin.ft.; weight per foot, plain ends; and capacity of pipe, per 100 ft. per min. velocity. The capacity for any other velocity than 100 ft. per min. can be estimated from that given in the table by multiplying by the given velocity expressed as percentage.

The Coal Age Pocket Book

TABLE SHOWING DIMENSIONS, WEIGHT AND CAPACITY OF STANDARD PIPES

Nominal Inside Diameter.	Actual Inside Diameter.	Actual Outside Diameter.	Actual Area of Bore.	Inner Surface per 100 Ft. of Pipe.	Outer Surface per 100 Ft. of Pipe.	Weight of Pipe per Ft.	Capacity of Pipe for Velocity of 100 Ft. per Min.

Inquiries of General Interest

Developing a Gaseous Mine

Will you kindly explain, in Coal Age, how you would develop, arrange, equip, officer and manage a gaseous and dusty mine, in order to insure freedom from accumulations of dust and avoid the danger incident thereto, while having due regard to safety and economy of operation?

Writer.

Greensburg, Penn.

Before starting to open a mine the property should be thoroughly prospected to ascertain the extent, thickness and inclination of the coal beds and the thickness and nature of the overlying strata, amount of water to be encountered, and other data of interest as affecting the extraction of the coal.

Having obtained this information, the next step is to choose a suitable location for the shaft and surface plant. In making this choice, due regard must be had to the proper drainage and ventilation of the mine and the haulage of the coal underground, as well as the shipping facilities on the surface and the arrangement of the necessary buildings and other equipment. An accurate map should be made of the property, showing the location of all surface tracks and buildings, together with the proposed plan of the underground workings.

In deciding on the general plan of the mine, much will depend on the nature of the roof, floor and coal and the depth and inclination of the seam, which must determine the method best adapted to the conditions found to exist in the strata, in order to insure the greatest safety and economy of operation. In the mining of deep-lying seams or thin seams, where complete extraction of the coal is necessary, the longwall method of mining will generally prove most advantageous.

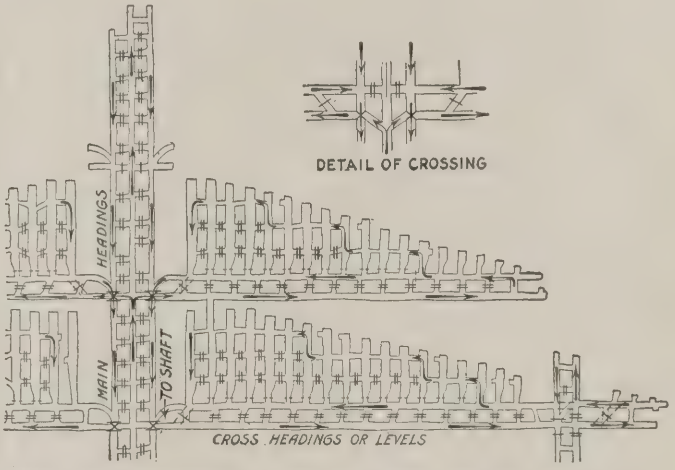
With a fairly good roof and floor and a seam of moderate thickness not lying too deep, some form of room-and-pillar method is generally applicable. But where gas or dust, in dangerous quantities, is present, it is often necessary to arrange the workings in districts or panels that can be ventilated by separate air splits.

The accompanying figure shows the plan of a mine opened on the room-and-pillar method, in a seam of moderate inclination. The main headings, in this mine, are driven up the pitch, on the triple-entry system. The center one of the three entries is made the intake and haulage road, while the two side entries are made the return for each side of the mine, respectively. As shown in the figure, levels are driven to the right and left of the main entries, at distances apart varying from 75 to 100 yd., depending on the distance the rooms can be driven up before the pillars must be drawn back. The length of these rooms will be determined by the nature of the roof, floor and coal and the thickness and inclination of the seam.

Owing to the inclination of the seam, in this case, the rooms are driven to the rise only of each pair of levels or crossheadings, and each pair is ventilated by a separate air split that is conducted to the face of the heading and returned through the crosscuts along the faces of the rooms, as shown by the arrows in the figure.

The surface equipment should consist of the usual steel headframe, tipple, screens. engine and boiler houses, hoisting engines, boilers, ventilating fans and engines, pumps, blacksmith and repair shops, storehouses, etc., required for the successful operation of the mine.

The officers of a mine producing, say 1000 tons of coal a day, should be a mine superintendent, a mine foreman, with as many assistant foremen as the conditions in the mine may require in order to provide for the thorough inspection and supervision of the work underground. There should be as many firebosses as may be necessary to thoroughly examine every working place, within three hours before the time for the men to enter the mine for work; and to thoroughly inspect the workings during the working hours.



Plan of Working a Gaseous Mine by the Room-and-Pillar System

The mine foreman should give his entire time to the management and supervision of the underground work; and each assistant foreman and fireboss should report to him daily, in respect to the safety and condition of the particular section of mine in his charge. All dangers should be promptly removed when discovered, or the men withdrawn from that place or section, until the same can be made safe for work. No accumulations of gas or dust should be permitted in any portion of the mine. The roads and air courses should be cleaned regularly; and, if necessary, a pipe line should be installed in the entries, to provide a suitable watering or spraying system, in order to prevent the drying out of the mine and thereby reduce the danger from dust.

In respect to the necessity for making suitable provision for sprinkling a dusty mine or for humidifying the air in a dry and dusty or gaseous mine, we would draw attention to the answer given last week in Coal Age, p. 29, which shows the enormous drying effect of the ventilating current in a mine, in winter.

Examination Questions

Miscellaneous Questions

(*Answered by Request*)

Ques.—If 2 hp. will produce 10,000 cu.ft. of air per min. in one airway, 10x10 ft. in cross-section, how many horsepower will it take to produce the same quantity of air in three airways, 6x5.5 ft. each, in cross-section, the length of all the airways being the same?

Ans.—For the same quantity of air in circulation and the same length of airway, the power on the air varies directly as the perimeter of the airway and inversely as the cube of the sectional area. In the case of three airways in parallel, both the perimeter and the sectional area of the airways must be multiplied by 3 to obtain the total perimeter and sectional area. The perimeters and areas in these two cases are as follows:

One airway, 10x10 ft.: $o = 4 \times 10 = 40$ ft.; $a = 10 \times 10 = 100$ sq.ft.

Three airways, each 6x5.5 ft.: $o = 3 \times 2\ (6 + 5.5) = 69$ ft.; $a = 3\ (6 \times 5.5) = 99$ sq.ft.

In comparing these circulations, the power ratio is equal to the perimeter ratio times the cube of the inverse area ratio, thus,

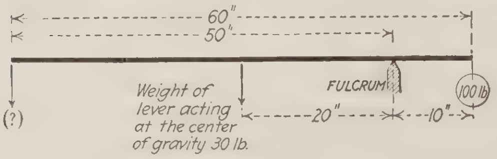
$$\frac{u_2}{u_1} = \frac{o_2}{o_1}\left(\frac{a_1}{a_2}\right)^3 = \frac{69}{40}\left(\frac{100}{99}\right)^3 = 1.77$$

Then, since the power on the air, in the first case, is $u_1 = 2$ hp., the power required in the second case is

$$u_2 = 2 \times 1.77 = 3.54\ hp.$$

Ques.—A lever of uniform cross-section and 5 ft. long weighs 30 lb. The fulcrum is 10 in. from one end of the lever where a weight of 100 lb. is suspended. What weight or force must be applied to the other end of the lever to produce equilibrium?

Ans.—Referring to the accompanying figure, the 100-lb. weight suspended from the short end of the bar has a lever arm of 10 in. The moment of this weight is opposed by the moment of the weight of the lever itself, acting through its center of gravity with a lever arm of 20 in.; and the force (F) applied at the other end of the bar with a lever arm of 50 in. The conditions of equilibrium require that the moment of the 100-lb. weight referred to the fulcrum as a center shall be equal to the sum of the moments on the other side of the fulcrum. This gives the following equation:



$$50\ F + 30 \times 20 = 100 \times 10$$

The force (F) that must be applied to the other end of the lever is then

$$F = \frac{(100 \times 10) - (30 \times 20)}{50} = 8\ lb.$$

Ques.—What load will break a white-oak timber, 10x12 in. in section and 15 ft. between supports, the load being equally distributed along the length of the beam?

Ans.—The breaking load of a beam supported at th two ends and uniformly loaded is found by multiplyin the moment of inertia of the beam by 16 times the fibe stress in pounds per square inch, and dividing this resul by the product of the length of the beam and its dept both expressed in inches. The moment of inertia of rectangular beam is

$$I = \frac{bd^3}{12} = \frac{10 \times 12^3}{12} = 1440$$

Then, taking the ultimate-fiber stress of white oak a $f = 10{,}000$ lb. per sq.in., the breaking load of this beam under the assumed conditions, is

$$L = \frac{16\ fI}{ld} = \frac{16 \times 10{,}000 \times 1440}{(15 \times 12)\ 12} = 53\tfrac{1}{3}\ tons$$

Ques.—The air traveling in a mine is divided between two airways or splits. In the first split, the cross-section of the airway is 5x8 ft.; and, in the second split, it is 5x6 ft. The first split being 1000 ft. long, if the ai divides equally between the two splits, what is the length of the second split?

Ans.—When an air current is split in a mine, it is assumed that the pressure is the same for each split Therefore, the pressure and quantity of air in circulation being the same in each split, the lengths of the airways will vary inversely as the expression o/a^3, or directly as the expression a^3/o. Hence, the length ratio for the two airways is equal to the cube of the area ratio times the inverse perimeter ratio. The perimeters and areas of these two airways are as follows:

First airway, 5x8 ft.: $a = 5 \times 8 = 40$ sq.ft.; $o = 2\ (5 + 8) = 26$ ft.

Second airway, 5x6 ft.: $a = 5 \times 6 = 30$ sq.ft.; $o = 2\ (5 + 6) = 22$ ft.

Applying the above rule and using these values,

$$\frac{l_2}{l_1} = \left(\frac{a_2}{a_1}\right)^3 \frac{o_1}{o_2} = \left(\frac{30}{40}\right)^3 \frac{26}{22} = \frac{27 \times 26}{64 \times 22} = 0.498$$

The length of the second airway is, therefore, $l_2 = 1000 \times 0.498 = 498$ ft. or, say, one-half the length of the first airway, for an equal distribution of the air.

Ques.—In order to insure a circulation of 70,000 cu.ft. of air per min. in the future development of a mine when the airways have been extended to a length of 4800 ft. and without increasing the power on the air, what will the same power produce at the present time, the present length of the airways being 1875 ft.?

Ans.—For a constant power on the air and the same size of airways, the quantity of air in circulation varies inversely as the cube root of the length of the airways. In other words, the quantity ratio is equal to the cube root of the inverse length ratio, which gives in this case

$$\frac{q_1}{q_2} = \sqrt[3]{\frac{l_2}{l_1}} = \sqrt[3]{\frac{4800}{1875}} = \sqrt[3]{2.56} = 1.368$$

The quantity of air circulated by the same power, at the present time, would then be

$$q_1 = 70{,}000 \times 1.368 = 95{,}760\ cu.ft.\ per\ min.$$

Coal and Coke News

Pennsylvania

Anthracite

Edwardsville—Adolph Rushnek, a miner's laborer, who lost his way in the big Woodward colliery of the Delaware, Lackawanna & Western Coal Co. was found by a rescuing party on New Year's day. He had been lost since Dec. 28. He was weak from lack of food and nerve-racked by his experience, but otherwise suffers no ill effects. He was only a half mile from where he became separated from his companions.

East Plymouth—A squeeze in the workings of the Delaware & Hudson Co.'s mine here has affected a wide area and a score of buildings have been more or less damaged while the settling is continuing. The main roadway is cracked in many places. Fences are distorted and foundation walls of buildings broken and the buildings themselves are somewhat out of plumb.

Hazleton—The Lehigh coal fields are receiving an influx of men from the bituminous regions of Pennsylvania, Ohio, West Virginia and Kentucky. Many claim to have walked most of the distance to seek employment in the anthracite operations.

Pittston—The first of a series of periodic conferences between the foremen, assistant foremen and officials of the Pennsylvania Coal Co. was held at Pittston on Jan. 2. General Superintendent W. P. Jennings led in a discussion of "Safety First."

Not a sigle fatal accident involving the loss of more than one life occurred in the lower division of the Pennsylvania Coal Co. during 1914.

Wyoming—The Schooley shaft of the Pennsylvania Coal Co., at Wyoming, for years filled with water, has been pumped out and is being cleared for operation, which will be begun as soon as the new Ewen breaker is ready to receive the output, which will be shifted under the Susquehanna River by a tunnel, already completed.

Scranton—On Jan. 4 a second reduction of 25c. per ton on pea coal sold in the local markets was advertised by the Peoples Coal Co. This makes the price $2.75 at the breaker, or $3.25 delivered. It was formerly $3.75 delivered. Other companies made similar reductions.

Bituminous

Arden—A fire of unknown origin occurring in the tipple of the Meadowland Coal Co., at Arden, four miles east of Washington, on the Pennsylvania R.R., recently entirely destroyed the structure, as well as 14 cars loaded with coal. The fire also spread to the mine itself and 14 men working on night shift were rescued with considerable difficulty. The loss is estimated at $50,000, and the mine will be out of commission for at least two months, throwing 500 men out of employment in the middle of the winter season.

Connellsville—The Connellsville coke production was somewhat better during the past few days, while prospects are more encouraging than for some months. Ordinarily, there is a marked recession in the coke trade during holiday week; but that was not the case this time. Merchant operators have put over 500 ovens into blast to meet increased demands for coke.

Windber—Options have been secured on between 700 and 1000 acres of coal land in Milford Township of Somerset County by John Lockrie, who, it is understood, has associated with him in the purchase a number of men active in the New England coal supply. Diamond drill tests will be made.

WEST VIRGINIA

Clarksburg—The Central West Virginia Coal Operators' Association was recently organized with Daniel Howard, of Clarksburg, as president; C. H. Jenkins, of Fairmount, vice-president; A. L. White, of Clarksburg, secretary, while J. C. Ryan, of Hepzibah, is treasurer. The objects of the Association are the conservation of coal properties by improved methods of production, and the safeguarding of miners and other employees.

Bluefield—The Big Vein Pocahontas Coal Co.'s mines were sold recently by receivers, the purchase price being $356,600, the property going to the bond holders. The plant has been in the hands of receivers since Oct. 29, 1910. The mines were purchased some years ago by T. T. Boswell, of Baltimore, but were only operated a short time before going into the hands of receivers, since which time it is said the receivers have made profits, it being stated that almost $200,000 have been earned since the receivership began. It is believed that the plants will be operated in future under the same management as at present.

Elkins—What is believed to be a record number of prosecutions by any of the mine inspectors of the state was made by W. B. Plaster at Thomas, W. Va., Dec. 23 last, when he made information against 14 miners and one motorman for violation of sections 15 and 16 of the West Virginia mining law. The miners were prosecuted and convicted for using short fuse, or what is termed "skin 'em backs," that is, attaching a short piece of fuse to a stick of high explosive in a drill hole, lighting the fuse and shoving back the explosive to the end of the hole, permitting it to detonate without tamping. The motorman was found guilty of operating trips of coal cars without a tail light on the rear end. He was fined $25 and costs, while the miners were fined $10 and costs each.

MARYLAND

Beryl—The Davis Coal & Coke Co. has resumed operations at mines Nos. 50 and 51. Superintendent Tibbetts, who was in Florida, was hurriedly recalled to resume charge. As a result of increased orders for coal for the Egyptian railways the Consolidation Coal Co. is reported to have increased the activity of several plants in West Virginia.

ALABAMA

Birmingham—Report of the chief state mine inspector, C. H. Nesbitt, to the legislature next month will not only narrate transactions of the past four years, but will make a number of recommendations as to amendments to the laws governing mining operations. The last legislature enacted many mining laws, but conditions have since arisen which call for drastic changes, especially along the lines of safety. It is probable that the recommendations made by Mr. Nesbitt will be passed by the legislature.

TENNESSEE

Knoxville—A special meeting of coal operators of the Tennessee-Kentucky field and members of the Southern Appalachian Coal Operators' Association is to be called here early this month to discuss the general coal-market situation. Certain routine business may also be transacted. Local operators state that though business is not as satisfactory as it might be it has improved to a considerable extent.

KENTUCKY

Sebree—After having been closed down for a considerable time on account of litigation, the Sebree coal mines are to be reopened at once by Lint & Watkins, of Birmingham, Ala., who have leased the property for a term of several years. H. A. Lint, senior member of the firm and a mining and civil engineer, is on the ground with new pumps which have been put to work. Mining operations will begin as soon as the water is out of the workings.

Greenville—Three men were killed and five injured in the Powderly mine of the Greenville Coal Co. recently when a large slab of slate fell from the roof of one of the main entries upon the car in which they rode. The mule drawing the car was killed but his driver escaped unhurt. W. A. Wickliffe, of Greenville, is president of the company which operates mines at Powderly and Martwick and employs a large number of men.

Rockport—Revival of the mining industry in this section is promised by the operators who own mines where work has been slack for several months. Large orders for both steam and domestic coals are beginning to come in, it is said, and within a month it is announced that the mines will be working six days a week.

Barbourville — Southeastern Kentucky and northeastern Tennessee coal mining operations are reported to be receiving large orders after passing a period of serious depression. The demand for both steam and domestic fuel was heavier during the past month than any other month last year. Additional miners are being employed and several thousands who were idle are now receiving steady employment. It is reported that the Southern Ry. has placed heavy orders with operators in the Mingo Hollow field of Claiborne County, Tennessee. Several plants have taken advantage of the recent dull period to install washers, which give a better grade of coal, obtaining a wider sale and better prices.

OHIO

Cleveland—It was the opinion of many operators who attended the meeting of the operator's association recently held here that it was useless to make further efforts to negotiate a settlement of the strike which has been in progress since April 1 last. Furthermore, many operators favor going on record as opposed to any future recognition of the United Mine Workers organization. A number of companies plan to abandon the Ohio field, some having gone so far as to purchase property in an adjourning state. Others are negotiating for property in either West Virginia or Kentucky preparatory to abandoning their Ohio holdings.

Bellaire—At some mines notices of eviction to the striking miners have already been posted. It is stated, however, that union officials will appeal to the courts. The report that the companies serving eviction notices intend to import strike breakers is unconfirmed.

Martins Ferry—It is said that representative W. B. Francis, has received so many letters asking for an investigation of the eastern Ohio mine strike that he has decided to request such a proceeding, and will ask the Department of Labor to investigate the strike.

Columbus—The Sunday Creek Co., of Columbus, which was taken over several weeks ago by J. S. Jones, a well known coal man of Granville, Ohio, and Chicago, has been completely reorganized. Mr. Jones purchased the outstanding stock of the company through the federal court at Cincinnati and has just completed the transfer. This action completely separates the company from the control of the Hocking Valley and the Toledo and Ohio Central railroads.

According to Dwight P. Cary, president of the Lorain Coal & Dock Co., that firm has not yet closed leases for a tract of coal land on the Island Creek in West Virginia. It is true that the company has been looking at available coal properties not only in West Virginia but also in Kentucky, and is trying to get some coal lands where labor troubles will not interfere with operations as its Ohio properties have been closed down since Apr. 1, 1914. The tract on Island Creek consists of approximately 14,000 acres.

INDIANA

Terre Haute—While it is admitted that there is a slightly better demand for fuel and some operators say they perceive a decided improvement, the majority of the Indiana coal producers are still waiting to be "shown" that there is a revival of industrial activity such as will make an appreciable increase in the demand for steam coal. Two weeks of continuously freezing weather has not brought appreciably more or larger orders for coal used for heating purposes.

Clinton—Surveyors of the Chicago & Eastern Illinois R.R. have been at work on a proposed coal switch from Newport to the L. J. Place farm, where several test holes have recently been drilled by Clinton mining men. Mine experts have yet to pass on the properties. Drillings in Newport territory in former years showed coal in thin strata or in pockets but recent drillings are deeper and more favorable.

Sullivan—The Consolidated mine at Hymera, the oldest in Sullivan County, has been abandoned, throwing about 220 men out of employment. It was expected the mine would last through the winter.

Petersburg—Hundreds of acres of surface coal land are being leased for stripping purposes between this city and Winslow. In some places the coal lies 20 ft. below the surface.

ILLINOIS

Shiloh—The cage in the Shiloh mine of the Southern Coal, Coke & Mining Co., of St. Louis, in some manner recently turned over when within 15 ft. of the bottom. Nine miners were slightly injured, and another escaped with a crushed foot. The short distance from the bottom was the only thing that prevented a serious accident.

Du Quoin—The first of the year saw several mines in this vicinity resume operations, after a shutdown of from a few weeks to several months. The Little Muddy mine at Tamaroa, north of here, has started up, having been leased to George Galbraith, Elmer Melvin and A. L. Linn. Several other mines that were temporarily suspended have made arrangements to resume operations.

Nokomis—The Nokomis Coal Co. recently established a new hoisting record by taking 1800 tons of coal from the ground in an 8-hour shift. This operation has been paying more attention to extending entries and otherwise looking to the future than in trying to establish hoisting records. The output is being increased continually, however, and a new record is made every few days. About 300 men are now employed.

IOWA

Knoxville—Three men were instantly killed and four injured, two of them probably fatally, by a recent dust explosion in a coal mine at Flagler. This explosion which was caused by a windy shot literally blew the men from the mouth of the entry, and those who escaped death were bruised and burned almost beyond recognition.

MISSOURI

Sedalia—After considerable prospecting, it has been announced by the Sedalia Commercial Club that two beds of coal, running practically together, have been discovered in Pettis County, in the vicinity of Spring Fork. One measure is of a coal similar to cannel and is 4 ft. in thickness. The other is a semi-bituminous 4 ft. thick. It is expected that there will be in the neighborhood of from 1500 to 2000 acres of this coal that is workable. C. S. Quick, a miner from Pennsylvania, has been carrying on the prospecting and will develop the property.

KANSAS

Pittsburg—The Cherokee & Pittsburg Coal & Mining Co.'s mines opened Monday, Jan. 4. The repair work on the mines was completed at that time and the first shots were fired late the previous week. Considerable debris had collected in the shafts and rooms during the past 8 weeks when the mines were idle.

Leavenworth—The cold weather that has prevailed for the past three weeks has caused much work to be done in the mines around the city. Because of the fires in the Home and North shafts only two mines, the Carr and the Riverside, are operating, but they are employing men up to the capacity of their shafts.

ARKANSAS

Fort Smith—According to the decision of Federal Judge Youmans, handed down Jan. 1, each of the 8 subsidiary mining corporations involved in the receivership of the Bache-Denman Co. is insolvent. This decision was given in the case of the Sebastian Coal & Mining Co., lessor of the mining premises which had petitioned the court for the removal of Franklin Bache as receiver of the Hartford Valley mines of the Bache-Nenman Co. A hearing is to be held Jan. 15 to ascertain whether the property shall be placed in bankruptcy or liquidated by a new receiver. United States troops still remain in the district guarding the mine under the federal receivership.

COLORADO

Denver—Troop "L" of the 12th United States Cavalry on patrol duty in the Oak Creek district of Routt County since May last, was recently ordered to return to its home station at Fort Meade, S. D. Orders for the gradual withdrawal of the other federal troops sent into Colorado to quell the imning disorders are in preparation.

FOREIGN NEWS

Newcastle, England — The Swedish State Railways in addition to some other amounts, recently contracted for 25,000 tons of Broomhill steam coal at 12s. per ton f.o.b., the shipments to be made from January to March. Several other contracts calling for about 100,000 tons in all have been closed at 11s. 3d. to 11s. 4½d. per ton f.o.b., shipments to be made during the coming year.

PERSONALS

John Bradfute, formerly mine manager of the Columbus Pocahontas Co., has taken a position as traveling salesman with the Hocking Valley Products Co.

George F. Hart, who has been receiver for the Goshen Coal Co., of New Philadelphia, Ohio, has handed in his resignation and has been succeeded by W. F. MacKay.

John S. Jemison has established an agency for the sale of mine, mill, furnace and electrical machinery supplies, with his office in the Empire Building, Birmingham, Ala.

William F. Marshall has been appointed traveling sales agent of the Seneca Coal Mining Co. of Buffalo, which now adds the selling of anthracite to its regular mining and marketing of bituminous coal.

Mayor Jermyn of Scranton has announced that he has appointed Arthur W. Long, Ralph Barrett and Fred Friend as members of the new mine cave commission recently created by the city council.

F. L. Garrison, formerly of Buffalo, but later a resident of Pittsburgh, has been appointed agent of the Pittsburgh-Westmoreland and Blaine coal companies at Buffalo, succeeding S. C. Van Norman, who lately resigned.

Robert E. Baker and Donald D. Herr have joined with Arthur G. McKee in the incorporation of an engineering and contracting business under the name of Arthur McKee & Co. Offices will be located in Cleveland, Ohio.

Neil Robinson, who has been confined to his home in Charleston, W. Va., for the past month with valvular heart trouble, is again able to be about and is spending a few days at LaFollette, Tenn., for the first time since he was taken ill.

Professor Ivan P. Tashof, of the College of Mines and Metallurgy, Lexington, Ky., and secretary-treasurer of the Kentucky Mining Institute, spent the Christmas vacation visiting the Springfield Mine Rescue Station and the big panel mines at Gillespie, Illinois.

L. M. Bowers has resigned as chairman of the board and treasurer of the Colorado Fuel & Iron Co. No successor has been appointed. Mr. Bowers remains a director of the above company. In future he will give the most of his time to the personal affairs of Mr. Rockefeller.

E. G. Goodwin has been appointed fuel agent of the Southern Ry. with headquarters in Knoxville, Tenn., and subsidiary offices in Birmingham, Ala., and Princeton, Ind. In the past, Mr. Goodwin has been chief fuel inspector of the Southern Ry. with headquarters in Knoxville.

"General" Jacob S. Coxey, of Massillon, Ohio, has hit upon a new plan of aiding suffering humanity. He proposes to lease a tract of coal land, supply the funds, and equip a mine, then invite as many miners as can work in it to become stockholders in the company. In other words, this will become a coöperative operation.

Charles S. Keith, president of the Central Coal & Coke Co., recently delivered two addresses before meetings called to discuss the proposed workmen's compensation act for Missouri, attacking the measure, and declaring that under it liabilities might pile up so rapidly that companies involved could not sell their bonds because of liens.

CONSTRUCTION NEWS

Bluefield, W. Va.—The Alpha Pocahontas Coal Co., recently incorporated with a capital stock of $125,000, with offices at Lynchburg, proposes to develop coal properties in the Pocahontas field soon.

Jenkins, Ky.—The Elkhorn-Shelby Coal Co., at Penny, Ky., on the Baltimore & Ohio R.R., has let contracts for the immediate construction of 300 modern miners' homes for the plant at Penny.

Johnstown, Penn.—The Ebansburg Coal Co. whose mines at Clover are putting out a considerable tonnage, is constructing a new car haul on its tipple, which will facilitate the work of loading railroad cars.

Hazard, Ky.—It is announced that the Hazard Town Coal Co. will let a contract at once for the construction of 200 miners' houses immediately below Hazard. It is stated that mining operations will begin Feb. 15.

Scranton, Penn.—Within a few days the new breaker of the Scranton Anthracite Coal Co. at Oak Hill near Moosic, will be completed and in operation preparing coal for market. The coal is secured by drifting and is of fine quality.

Viper, Ky.—The Viper Coal Co. is being reorganized by Pennsylvania people and will start development work by Feb. 1, as scheduled. They will have an electrically equipped plant, first class in every respect. The old L. F. Brashear coal land tract is to be developed.

Shenandoah, Penn.—Pottsville, Scranton and Pittsburgh capitalists have purchased the Whippooorwill Colliery on Broad Mountain, which was abandoned some years ago Work will be immediately begun in reclaiming the old operations and getting them in shape for production.

Bluefield, W. Va.—Preliminary work of constructing an 88,000-volt transmission line for the Jewell Ridge Coal & Coke Co., from Jewell to Berwind, has been begun by W. R. Doss. This line will be 8 miles in length and the system is to be one of the most modern in the coal field. Mr. Doss was awarded this contract against about half a dozen competitors.

Huntington, W. Va.—The Norfolk & Western R.R. Co. recently started a force of 400 men grading on Pinnacle Creek in Mingo County. It is also reported that it has completed the purchase of rights of way for a connecting line from Widemouth on the main line across Clark's Gap, using the Virginian tunnel down Pinnacle Creek to Guyandotte River and thence down that stream to the mouth of Gilbert's Creek, thence up Gilbert's Creek and up Ben's Creek to the main line at Wharncliff. These developments are regarded as among the most important in years.

NEW INCORPORATIONS

Cleveland, Ohio—Papers have been filed increasing the capital stock of the Pluto Coal Co. from $10,000 to $15,000.

Norris, Ill.—The Genuine Norris Coal Mining Co. has been incorporated here with a capital of $2500, by Joseph Quigley, A. E. Whitehead and Harry Wood.

Mullens, W. Va.—The Miller Pocahontas Coal Co. has been incorporated with a capitalization of $100,000, to mine coal. L. N. Frantz, of Mullens, and others, are interested.

Lincoln, Ind.—The Rose Hill Coal Co. has been organized, with a capital stock of $6000, for the purpose of coal mining. The directors are T. W. Richardson, R. E. Price and Malcolm Reed.

Maben, W. Va.—The Sabine Smokeless Coal Co. has been organized to develop 700 acres of coal land. This firm will install electrical equipment and contemplates a daily output of 1000 tons.

Sullivan, W. Va.—The Amigo Coal Co. has been organized with a capital stock of $100,000, to handle coal and coke. J. A. and Fred G. Wood and W. W. Kolner, of Sullivan, and J. C. Sullivan, of Mullens, are the incorporators.

Ashland, Ky.—A charter of incorporation was recently issued to the Alum Creek Block Coal Co. This firm, which has an authorized capital of $250,000, will have its chief works in Kentucky. The incorporators are S. S. Willis, James B. Servey, K. M. Fitzgerald, M. C. Fossom, and L. S. Wilson, all of Ashland, Ky.

Dover, Del.—Articles of incorporation were recently filed for the McFetridge Coal & Coke Co., of Pittsburgh, Penn. The capital stock is placed at $200,000, and the object of incorporation is to acquire, own and lease lands for the development of coal, iron and other minerals. The incorporators are Charles E. McFetridge, of Creighton, Penn., Charles B. Clark, of Pittsburgh, and James B. Mattes, of Butler, Penn.

Columbus, Ohio—The William J. Hamilton Co. has been incorporated under the laws of Ohio, with a capital of $10,000, to deal in coal in a wholesale manner. The company, which is headed by William J. Hamilton, has been doing business under the same name with a West Virginia charter. The change only means incorporating under Ohio laws. John R. Schwartz has taken a position with the company to travel northern Ohio.

INDUSTRIAL NEWS

Birmingham, Ala.—The Tennessee Coal, Iron & R.R. Co. has just closed a contract with the Louisville & Nashville R.R. for 38,000 tons of rails to be rolled at the Ensley mill, for delivery over the first half of 1915.

Huntington, W. Va.—Although the coal loading business on the Chesapeake & Ohio R.R. has increased lately, December coal loading will not equal that during December of 1913. It is believed, however, by company officials that a considerable increase in business will take place during the present month.

Portsmouth, Ohio—Caught in a gale on the Ohio River near Buena Vista, the tow boat "Val B. Collins," of Huntington, owned by the Island Creek Fuel Co., recently sank with barges containing 25,000 bushels of coal. The gasoline tow boat "Adrian," owned in Buena Vista, was also sunk in the same storm.

Denver, Colo.—Claims aggregating $23,000 were recently filed against the State of Colorado by the government of Austria-Hungary as an indemnity for one Austrian killed and the destruction of property belonging to others in the Ludlow and subsequent incidents in the coal field strike. Similar claims will be filed at Washington.

Charleston, W. Va.—Coal and coke shipments over the lines of the Norfolk & Western Ry. during the month of November show that 1,927,326 tons were handled, being a decrease of 377,478 tons as compared with the same month for 1913. For the eleven months of the year an increase of 348,925 tons is still held over the previous season, 24,776,340 being shipped in 1914.

San Francisco, Calif.—The United States Government recently began suit against the Pacific Mail Steamship Co. for the recovery of $323,695.16 in drawback duties, which it is alleged were paid on false claims. This suit is one of a number instituted by the Government as an aftermath of the criminal prosecution of officials of the Western Fuel Co for alleged false weighing of imported coal.

Washington, D. C.—Aiming at the alleged control of the Pennsylvania coal fields by the Philadelphia & Reading, the Delaware, Lackawanna & Western, and the Lehigh Valley railroads, Representative Adams, of Georgia, recently introduced in the House a bill which will amend the commodities clause of the Interstate Commerce Act so as to restrain railroads from building or controlling coal properties.

Cincinnati, Ohio—General Manager Davis, of the Cincinnati, Hamilton & Dayton R.R., announces that about Jan. 4, 500 shop men of the company were taken back to work at various points on the line, in view of increasing business. About two weeks ago the shops were closed as a measure of retrenchment, but it appears that during the interval the company found business to be increasing to such an extent as to render it necessary to reëmploy many of the men laid off.

Washington, D. C.—It is estimated that the value of the agricultural crops of the State of Pennsylvania approximately equaled the value of the anthracite or the bituminous coal produced. The value of anthracite for 1913 is placed at $195,181,127. The bituminous coal produced in the same year was valued at $193,039,806, while the ten leading agricultural products of Pennsylvania for 1914 is estimated by the department of agriculture to be worth $184,697,395. Other crops not listed will bring the agricultural products of the state approximately up to the figures for the coal.

Rayland, Ohio—The Pluto Coal Co., organized by a number of miners and others, has leased the mine of the Rayland Coal Co., Rayland, Ohio, one of the John H. Jones' interests, paying enough money into the coal company's treasury to avert default on the mortgage. The mine will be put in operation shortly. Hopes are entertained that with similar coöperation on the part of banking interests in Pittsburgh the Four States Coal Co. can be taken out of receivers' hands within 60 or 90 days.

Danville, Ill.—John L. Billiman, a coal miner, was recently awarded $562 in the Circuit Court for disfiguration of his features caused by a premature explosion in the Two Rivers mine last December. It was claimed by the coal company that Billiman's earning capacity was not impaired, and that an impairment of good looks was not grounds for damages. The judge held that this might possibly be the case if the complainant expected to always work as a miner. He held, however, that good looks in many vocations are a real asset. The case will be appealed to the Supreme Court.

Washington, D. C.—On Jan. 1, Secretary Lane issued regulations under which settlers may take for a two-year period 10-acre tracts of Alaska coal land for local and domestic fuel needs. He announced that on account of legal complications caused by existing claims and the fact that there are no settlers in the immediate vicinity, the Bering River and Matanuska fields would not be opened for the present. Considerations are, however, being given to leasing regulations covering the general mining of coal in Alaska, and will be issued as soon as practicable. Under the present action, however, the opening of mines on an extensive scale for exportation is not permitted.

Columbus, Ohio—The movement to build a ship canal connecting the Ohio River with Lake Erie is receiving support in Cleveland, Columbus, Akron, Canton, Zanesville and other cities and towns, especially in the eastern part of the state. Burd S. Patterson, of Pittsburgh, secretary of the Canal Association, recently visited Cleveland for the purpose of organizing a committee of 12 in connection with the project. He claims that rail carriers will benefit by the building of the canal through great increases in population through the territory to be traversed. He is of the opinion that the counties through which the canal is expected to pass should guarantee the bonds to be issued for construction and if such a course is followed the canal can be opened by 1920.

Columbus, Ohio—Powers similar to those possessed by the Interstate Commerce Commission with respect to inter-state traffic are desired by the Ohio Public Utilities Commission with respect to intra-state traffic. As the laws of Ohio now stand, the commission has no authority to suspend a rate or service schedule that may be filed with it. The result of this alleged defect is that often unfair rates are filed and notwithstanding strenuous protests on the part of the commission and the interests they affect adversely, they go into effect and can only be reached by the commission after they have become operative. The commission therefore recommends that it be given authority to suspend or postpone the date for all schedules becoming effective pending investigation. As a corollary of this suggestion is a recommendation that railroads be required to give 20 days' notice of a change in rates unless otherwise ordered by the commission.

Coal Trade Reviews

General Review

Anthracite steady on about a normal basis.. Current bituminous trade quiet but there are distinct indications of a turn for the better. New contracts coming up. Prices firm but no advance is anticipated for the present.

The retail anthracite trade has shown a substantial improvement, due to the recent cold weather, but the activity has not yet been reflected in the mining operations which are still curtailed. Supplies are generally plentiful on all sizes but a continuance of low temperatures will develop a shortage that will necessitate full time operations shortly. Prices are generally firm at the full circular.

Tangible evidence of a turn for the better is apparent in the bituminous market and there is a distinct note of optimism in the trade. On current business there is still a general heaviness in all directions but the severe restrictive measures at the mines have reduced excess tonnages and colder weather has created additional interest in the market. Outside of the movement on contracts, the demand is spotty, with prices very irregular, but on the whole notably steadier than for some time past. New contracts are being discussed and agencies are getting lined up for an aggressive campaign and an improvement in export business is an encouraging feature though ocean rates still continue prohibitive.

As a rule the mines are completely covered on slack and are refusing to quote further; track coal has been cleaned up in all directions and more orders are appearing than for a long time, but it will take hard pushing to advance prices. With inquiries in the market aggregating about a million tons, the Pittsburgh district is assuming a more cheerful tone and indications over the future are regarded as most encouraging. Current production has also improved slightly, though prices are as irregular as ever.

With all the recent constructive developments still in force in Ohio, such as the cold weather, depleted stocks and improved industrial situation, the market is notably firmer. Retailers permitted their stocks to get unusually low during the long period of dullness and many of them are now facing an almost complete exhaustion of supplies, so that urgent orders are coming in. Industrial requirements are still light, the steam business continuing dull though manufacturing appears to be increasing slightly.

The colder weather of the past ten days has brought out many small orders for rush shipments in the Southern market and a continuation of this condition will clean up stocks shortly. The steam demand, however, continues quiet and far below normal.

In the Middle Western market the reduced production over the holidays has thrown the mines behind on their orders and an active trade is anticipated through the balance of the winter. Prices are steady to firm, with a marked tendency upward. It is expected that the improvement in the steam business will be slow but sure.

ATLANTIC SEABOARD

BOSTON

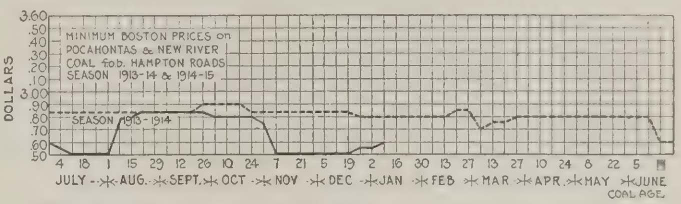
A better tone noticed. Contract demand helped out by cold weather and some off-shore inquiry has developed. Georges Creek shippers have plenty of orders, but Pennsylvania operators' market still restricted. Anthracite looking up.

Bituminous—A slightly stronger tone is noticed in bituminous. The supply of Pocahontas and New River at Hampton Roads is still much in excess of chartered tonnage, but the curtailment continues in force and the prospect for January orders is rather better than was anticipated. The seasonable weather helps out the contract demand and the slower movement of transportation coastwise is also a favorable element.

There is already talk about season contracts, prices, etc., although it is generally felt that this is premature. A realignment of certain of the New River agencies is rumored, but no announcement has yet been made. Some of the New River interests feel they have not had as large a share of the coastwise trade as they should; for that reason it is likely there will be a stronger effort to place a comprehensive tonnage this coming season.

While $2.85 continues the nominal basis f.o.b. Hampton Roads, it is being freely shaded on what orders come in; 15c. less is nearer the actual figure, and sales are not by any means heavy at that. Meanwhile, the export market shows signs of improvement, and that is perhaps the most encouraging factor to report this week. There is more inquiry offshore than for several weeks past, although suitable carriers are still scarce and command high rates.

Prices on cars for inland delivery are steadier than for several months; $3.68@3.78 is the range, with considerably less spot coal offering. The unfavorable weather along the coast has tended to limit the supply and the market is much better in that respect.



The Georges Creek shippers are in excellent position on orders. There is still a demand on them to get cargoes forward, but shipments are not far behind, and there are enough orders ahead to take care of present output very comfortably.

The market on Pennsylvania grades is not yet out of the narrow limits imposed by conditions some months ago. The restriction in mining continues and outside of contract demand the trade is very spotty. Most of the operations are running on orders only, and there are few shippers now who care to risk demurrage and other losses that go with "coal on the market."

Anthracite—Retail trade is particularly good and compares very favorably with a year ago. December was a good coal-burning month and dealers are keeping close watch of their storage. Orders are in better supply with the anthracite companies, but the movement of barges is disappointingly slow. Stove size is still easy, while egg and chestnut are a drug. If the weather continues cold, wholesale trade will be active by the end of January.

Wholesale quotations on bituminous are about as follows:

	Clearfields	Cambrias Somersets	Georges Creek	Pocahontas New River
Mines*	$0.90@1.50	$1.15@1.65	$1.67@1.77	
Philadelphia*	2.15@2.75	2.40@2.90	2.92@3.02	
New York*	2.45@3.00	2.70@3.20	3.22@3.32	
Baltimore*	....	....	2.85@2.95	
Hampton Roads*	....	....	....	$2.60@2.75
Boston†	....	....	....	3.68@3.78
Providence†	....	....	....	3.58@3.73

* F.o.b. †On cars.

NEW YORK

Bituminous somewhat improved due to the restricted output over the holidays. Anthracite retail trade notably stronger though mining operations have not been materially effected as yet.

Bituminous—There is no particular change in the bituminous situation. The holidays, of course, reduced the tonnage mined and the bad weather has also tendered to delay deliveries. This has improved the tone of the market to a certain extent and there is some demand for spot tonnage though it is not heavy.

Most of the operators mined less tonnage last year than in 1913. On a whole, however, the market has maintained a healthy aspect and has been fairly satisfactory. There has been less demurrage coal and consequent sacrifice prices than has been the rule in former years. The better grades find a reasonably steady market and the producers of poorer grades have found that they cannot pay dividends and at the same time sacrifice their coal and pay demurrage to the railroads.

There is considerable optimism displayed in the steel trade. It is reported that the railroad companies are now getting into the market for equipment and there seems to be a general feeling that this will be better during the new year. Prices continue unchanged as follows: West Virginia steam, $2.35@2.55; fair grades, Pennsylvania, $2.55@2.65; good grades of Pennsylvania, $2.70@2.80; best Miller Pennsylvania, $3.10@3.15; Georges Creek, $3.15@3.25.

Anthracite—The retail trade reports very active conditions for the past week, due to zero weather. This condition, however, has not been reflected fully in the demand on the operators. The stocks in the hands of the retail dealers and consumers seem to be considerably heavier than they were at the same time last year. But a continuance of the low temperatures is bound to clean up the surpluses and the demand from the wholesalers during the next week or ten days will undoubtedly be heavy.

The movement over the piers in New York Harbor has been much retarded on account of the frozen condition of the coal. At some of the ports boats have waited as much as four or five days for their cargoes with the coal standing at the piers all the while.

Chestnut and pea, especially the latter, are in most demand and shortest supply. Strange as it may seem, stove which ordinarily is the strong size in the East is very easy but there is practically none offering off circular. Egg continues to move at 15 to 20c. below circular. All of the fine sizes, especially in the better grades, are well taken up. The demand on No. 1 buckwheat has increased materially and in some quarters there is a shortage reported on this size. Nos. 2 and 3 buckwheat are also in good demand.

It will be remembered that last year we had practically no winter until well into February, whereas this year it has been much more seasonable. This produces a very healthy condition and with a continuance of the low temperatures, the producing companies may be expected to move off considerable of their stocks in certain sizes.

The market continues quotable on the following basis:

	Upper Ports		Lower Ports	
	Circular	Individual	Circular	Individual
Broken	$5.10	$4.60@5.10	$5.05	$4.55@5.05
Egg	5.35	5.00@5.35	5.30	4.80@5.30
Stove	5.35	5.25@5.35	5.30	5.20@5.30
Chestnut	5.60	5.45@5.60	5.55	5.40@5.55
Pea	3.55	3.45@3.55	3.50	3.35@3.50
Buckwheat	2.80	2.50@2.80	2.50@2.75	2.15@2.75
Rice	2.30	2.20@2.30	2.00@2.25	1.35@2.25
Barley	1.80	1.60@1.80	1.75	1.25@1.75

BUFFALO

Stiffness of slack continues the main feature. Factories starting up cause a generally better feeling. Consumption larger, but no important increase anticipated yet. Anthracite doing well.

Bituminous—There is at the present moment a larger demand for slack than can be filled. Those not finding business better ascribe this to the fact that the demand for three-quarter is so light. Shippers are getting letters from various mines, stating that the supply of slack is exhausted and declining to quote on it. The situation has not been so acute for a long time. Any sort of slack is firm at not less than 90c. at the mines.

There is no coal on track and jobbers are now on the watch for cars to divert to new points, which is something new. The steady winter weather has been a big help. Activity in Canada is reported everywhere. Orders from that direction between Christmas and New Years were quite larger than the average of the month and there are many who believe it is going to last. This will firm up prices and do much good.

Stocks in consumers' hands are not so large as they were; railroads especially are short. The price of bituminous is stronger, though quotations have not advanced and continue as before on the basis of $2.80 for Pittsburgh lump, $2.70 for three-quarter, $2.55 for mine-run and $2.15 for slack. Allegheny Valley coal is about 25c. lower than Pittsburgh.

Anthracite—There is a good movement of all sizes, though egg is inclined to drag. As there has not been the usual clamor for the smaller sizes the trade is generally quiet though, with a normal movement, which is sure to keep up so long as the present severe weather continues. There is considerable activity in water coal, one company having loaded well toward 100,000 tons into large vessels, which will remain in storage till the Lakes open in the spring. In this way it has been possible to get a large amount of egg out of the way temporarily, though there are still those who believe that the preparation of anthracite will have to be modified before long, so that this size can be broken down into stove and chestnut coal.

The local anthracite trade is good, though the great number of city dealers makes it difficult to get much profit. There has not been much price cutting reported lately. The use of natural gas is so great that the city anthracite trade is not what it should be.

TORONTO, CAN.

Situation materially improved as a result of the cold weather. Supplies plentiful so far.

Steady cold weather having prevailed for some time the market has been active. The demand for steam coal is improving and conditions gradually approaching normal. Rail shipments are coming in steadily but in comparatively small volume, as the market is well stocked. Wholesale prices for bituminous have advanced slightly, quotations being as follows: Retail, anthracite, egg, stove and nut $8; grate $7.75; pea, $6.75. Bituminous steam, $5.25; screenings, $4.35; domestic lump, $6; cannel, $7.50. Wholesale f.o.b. cars three-quarter lump, $3.78; screenings, $2.79.

PHILADELPHIA

A moderate weakness still characterizes anthracite trade and curtailment is still necessary. Domestic sizes in fair demand. Better feeling in bituminous circles, with demand slightly increased and prices steady.

Anthracite—With the more seasonable weather of the last two or three weeks, it was expected that the trade would exhibit some of the usual strength of this season of the year, but, on the contrary, there seems to be an apathetic condition prevailing on almost all sizes, with the possible exception of the steam grades. Every domestic size is in easy supply, and the dealers are simply working from hand to mouth in replenishing their stocks. Even stove manifests weakness, and as this was the lever by which the other sizes have been moved most of the current season, the operators find themselves hard pressed to move these.

Pea still shows an inclination to lag; as a rule, stocks of this size are being materially reduced at this time, but the reverse has proved to be the case this year. Prices are still maintained by the large companies, but the individuals are pressing their output on the dealers with very attractive offers. Many are also postponing purchases until some definite action has been taken by the railroad companies in regard to the recent ruling of the State Service Commission. The rule must go into effect on Jan. 12, and as yet no steps have been taken to postpone its operation.

Prices at Tidewater are about as follows:

	Circular	Individuals
Broken	$4.75	$4.50
Egg	5.00	4.75
Stove	5.00	5.00
Chestnut	5.25	4.90@5.00

Bituminous—There seems to be a slightly better feeling in the bituminous trade. Some contracts are being closed, but at prices that show little advance. Considerable coal is yet moving from Tidewater points, and all the accumulations there are on firm orders, and are simply waiting for water transportation.

BALTIMORE

The new year opens up with a slow but sure improvement. Demand a little stronger and car movement not so good. Cold weather aids anthracite trade.

The New Year has been inaugurated with a slow but sure improvement to the trade in evidence. General industrial and manufacturing conditions are also reported better and there is a distinct feeling of optimism despite the flat state of business as compared with the same month a year ago.

The demand for coal is a little better than last week. Westward the call for slack has improved, and from West Virginia come reports that the screenings are being sold at the mines at around 65 and 70c. Run-of-mine is worth 80c., while three-quarter gas is usually selling for 90c. in numbers of cases, although the demand is none too strong. The higher grade Pennsylvania coals are in better shape also, and the movement is reported as fair but mostly on contracts. Lower grades sell variously at from 95c. to $1.05, medium grades around $1.10, and best coals at about $1.30.

The cold weather continues to aid the anthracite trade. The December consumption of household coals was probably the largest for a number of years, and this is beginning to tell in the matter of supplementary orders. There has for the most part been adequate supplies at all times. Coal for the export piers has been doing the best, and there has been little trouble therewith except as to coal coming to tide badly frozen.

HAMPTON ROADS

Bunker prices for 1915 are $3.30. Stocks somewhat reduced. Shipments for week about fair. Monthly dumpings for December 827,571 tons.

The dumpings for the week were about fair even with the holidays. Bunker vessels still hold up well and are appreciably swelling the dumpings. Some large cargoes have gone to Boston, Portland, Providence, Everett and other coastwise points while the government has taken a small amount of coal and considerable has moved in the export trade.

The bunker price for 1915, effective Jan. 1, is $3.30 per ton plus trimming and covers both American and foreign steamers. The cargo price is still $2.85 to $2.90 but no coal is being sold at the latter price at this time. There appears to be somewhat less coal on the railroad yards than a few weeks back. One or two of the large shippers who had an excess supply on hand early in the month, are practically cleaned out. It is also understood that one or two cargoes have been loaded from the storage plant at Sewalls Point during the week.

As was expected December dumpings have not been as heavy as would have been the case under ordinary conditions. The total dumpings for the month amounted to 827,571 tons of which the Norfolk & Western Ry. moved, 416,099 tons from Lambers Point, the Chesapeake & Ohio Ry., 206,171 tons from Newport News, and the Virginian Ry. 205,301 tons from Sewalls Point.

Clearances for the week ending Jan. 2, were as follows:

Vessel	Destination	Vessel	Destination
Progresso[1]	Georgetown	Haugarland[2]	Genoa
Windemere[1]	Trinidad	Juno[2]	Kingston
L. K. Thurlow[1]	U. S. Gov.	Justin[2]	Para
Sjostad[1]	Unknown	Bellasco[2]	Buenos Aires and Montevideo
Caprera[2]	Dakar	Estelle Kreiger[2]	Puerto Cabello, Venz.

[1] Loaded at Newport News. [2] Loaded at Norfolk.

OCEAN CHARTERS

Coal charters have been reported by the "Journal of Commerce" as follows:

Vessel	Nationality	From	To	Tons	Rate
Chelston	British	Philadelphia	Havana	2389	
Ecaterina Couppa	Greek	Baltimore	Spezia	1774	
Selene	Italian	Baltimore	Spezia	2368	
Earl of Aberdeen	British	Baltimore	Martinique	416	
Sangstad	Norwegian	Baltimore	Port Limon	1459	
Luigi Parodi	Italian	Baltimore or Norfolk	West coast of Italy	2672	$7.20

Note—Steamers are indicated by **bold face** type, all others being schooners.

OCEAN FREIGHTS

Advance in rates still continues, but the market is irregular and occasional reductions are reported.

The freight market continues to advance, and although a few steamers were chartered for export coal at high rates during the past week, none of these fixtures have been reported. Occasionally steamers are proposed for export coal that are willing to accept less than current market rates. Rates quoted below, under present conditions, are bound to be more or less uncertain, and can be bettered.

To	Rate	To	Rate
Havana*	$2.00	Guantanamo	$2.50@2.75
Cardenas or Sagua*	2.50	Demerara*	4.50
Cienfuegos*	2.50	Bermuda	2.40@2.50

Santiago	2.50@2.75		

*About. †Small boats to Kingston $2.50@2.75. W. W. Battie & Co.'s Coal Trade Freight Report.

OHIO VALLEY

PITTSBURGH

Mines running slightly better. Large increase in inquiry on contract. An authority predicts full operations before end of April, and large price advances in August.

A considerable volume of inquiry has come to the trade for contract coal for the calendar year 1915, inquiries now in hand totaling a million tons or more. The major portion of the contracting, however, will be for the twelve-month beginning Apr. 1, as many contracts expire at that time. Coal requirements have experienced a slight further increase in the past week and mine operations continue at fully 50% of capacity, against 40% or less two or three weeks ago.

Prices are as irregular as ever. The usual contract quotation is on the basis of $1.20 for mine-run, with 10c. advance for ¾-in., and slack at 85@90c. The prompt market continues quotable as follows, with not infrequent shading: Slack, $90c.@$1; nut and slack, $1; nut, $1.10; mine-run, $1.15; ¾-in., $1.25; 1¼-in., $1.35, per ton at mine, Pittsburgh district.

John H. Jones, one of the receivers and formerly the head of the Pittsburgh-Buffalo Co., authorizes publication of the prediction that coal mine operations will gradually increase until the Pittsburgh district is running practically full by Apr. 20; that prices will continue low, nearly as low as at present, probably, until about Aug. 1, when a phenomenal advance in prices will begin. Mr. Jones' predictions in the past have shown a high percentage of fulfillment.

COLUMBUS

A better market for domestic sizes due to the continued colder weather. Dealers are placing orders for immediate delivery. Steam business is still dull.

The colder weather of the past several weeks has caused a much firmer feeling in the local trade. Prices are more regular and there is a pronounced tendency to advance, especially in domestic grades. On the whole the tone of the market is better and prospects for the future are much brighter.

Because of the semi-annual inventories at this time, dealers' stocks are unusually light and buying for immediate delivery is being done on a large scale. In many cases retailers have been facing a complete exhaustion of supplies. Dealers have been handicapped in making deliveries because of the icy streets. Many of the householders who have been depending on natural gas for heating purposes have been forced to start burning coal again because of the low gas pressure and this has enlarged the market appreciably. Retail prices are firm and there is some talk of an advance after the first of the year.

The steam business is dull and there are few if any signs of improvement. Manufacturing appears to be increasing slightly but the process is slow. Fuel requirements are not large and much of the buying for steam purposes is being done on the open market. A few steam contracts expire at this time and sales managers are devoting their attention toward renewing them.

Production in Ohio fields has been curtailed during the past week because of the New Year's holiday. This cuts into the output one day. The output during the week in the Hocking Valley, Jackson and Massillon fields was about 65% of normal. In the Pomeroy Bend field the output was about 80% of the average.

The market for anthracite shows considerable firmness and the volume of business is gradually increasing.

Prices in the Ohio fields are:

	Hocking Valley	Pomeroy	Kanawha
Rescreened lump	$1.60	$1.70	.....
Inch and a quarter	1.50	1.60	$1.45
Three-quarter inch	1.35	1.40	1.35
Nut	1.15	1.25	1.15
Mine-run	1.10	1.15	1.10
Nut, pea and slack	0.65	0.70	0.60
Coarse slack	0.55	0.60	0.50

CINCINNATI

Holiday layoff at the mines causes a better tone although there was no real shortage. The demand is about equal on both steam and domestic, for the first time in some months.

The several factors responsible for the improved market in this vicinity, have all continued in force during the past week, and have been accentuated by the curtailed production over the holidays. The slowing up was not as general as usual, however, or there was considerable coal on tracks, as shipments have been steady. An encouraging factor to the trade is the better balance between steam and domestic grades, enabling the mines to market their output to much better advantage. The steam demand shows indications that the long expected industrial revival is beginning to materialize. Prices are generally firm except in case of coal on tracks that has to be sold.

The domestic market is in a better condition than for a year or more, as both dealers and consumers are short of fuel, and are keeping available supplies moving rapidly. This gives every promise of activity during the entire winter, as it is virtually impossible for the production to run ahead of consumption during the cold months.

COKE

CONNELLSVILLE

Market quiet after recent activity. Some real contract foundry quotations being made. Production and shipments increased.

The coke market has been very quiet the past week, as all the contracts under negotiations have been closed and there is hardly any uncovered consumption among furnaces now operating. In foundry coke some definite quotations on contract are being made, the old quotations of $2.35@2.50, in effect when twelve-month contracts were closed six months ago, being practically abandoned. The market is quotable as follows: Prompt furnace, $1.60; contract furnace, $1.75; prompt foundry, $2@2.20; contract foundry, $2.15@2.35, per net ton at ovens.

The "Courier" reports production in the Connellsville and lower Connellsville region in the week ended Dec. 26 at 208,130 tons, an increase of 9597 tons, and shipments at 207,280 tons, an increase of 19,231 tons.

BUFFALO

There is some idea that coke is improving in demand. Certain members of the trade say it is stronger, but the general impression is that it will stay about where it is till there is more general business doing and especially till the iron trade is on its feet. Coke continues to sell on the basis of $4.25 for best 72-hr. Connellsville foundry, with stock coke $3.30.

CHICAGO

There is a good demand for domestic sizes of byproduct coke, and many inquiries are being made for furnace and foundry coke on contracts. Prices are as follows: Byproduct, $4.75@5.00; Connellsville, $4.75@4.90; Wise County 72-hr. (select), $4.75; gas coke, $4.25@4.50; furnace coke, $4.50@4.75.

STEEL INDUSTRY

New year opens quietly. Considerable buying reported with more being negotiated. Tonnage involved less than last year.

The steel trade has drifted quietly into the new year. December buying in bars, plates and shapes was liberal in comparison with November and the advance to 1.10c. Pittsburgh, which all important producers announced, to be effective Jan. 1, led to a fair amount of covering at lower figures.

Mill operations this week have naturally shown rather better schedules than those of the holidays, but the increase is not pronounced.

Actual and prospective buying by the railroads has had a good deal of publicity, particularly as to rails. A 40,000-ton order has been placed by the Louisville & Nashville with the Tennessee company. The Pere Marquette has bought 10,000 tons and the Reading has placed some business, including 2500 tons at Pittsburgh. The Pennsylvania order is expected to be placed soon and the New York Central is making up its requirements.

Much has been made in current news of the few rail contracts thus far placed, but 170,000 tons was bought by two lines at the opening of 1914.

The Pere Marquette order has been widely advertised as going to a Canadian mill. Its tariff phase is interesting, since $25 at mill, or $26.50 at lower Lake port, was charged for the rails to be delivered in the United States, while $30 was the mill price on the Canadian part of the order. Canada's rail tariff is $7. Another Central Western road, which earlier in the year had a low price from the Ontario mill, but did not buy there, is understood again to have Canadian prices below those of domestic rail mills.

The report of a purchase of 10,000 tons of Canadian rails by an Eastern road lacks definite confirmation.

Probably 250,000 tons of rails are now under consideration as against 300,000 tons referred to in the same way in the market reports of the first week of 1914.—"The Iron Age."

SOUTHERN

BIRMINGHAM

Cold weather helps lump coal slightly. Steam coal still quiet, but with a better tone.

The cold weather of the past ten days has helped lump coal temporarily, bringing out many small orders for rush shipment, though none of the yards are buying heavily. With ten days more of low temperatures, lump coal would see a decided improvement, as this would very nearly clean up all the stocks, and, as the months of January and February are the coldest of the season, the retailers can still expect quite a large tonnage to be called for. Steam coal is still quiet, with the demand far below the capacity of the mines. Many of the mines have not resumed operations since Christmas, waiting for a better market. Blacksmith coal is normal.

LOUISVILLE

Return of milder weather has again set the market back. Prices are about on a summer basis and very irregular.

The return of milder temperatures has again put this market in a bad way. It is impossible to note any regular prices, though generally they are on a spring and summer basis, with the same grades of coal selling at various prices—usually whatever the operators can get. Some companies are asking from $1.90 to $2 for their high-grade Eastern Kentucky block coal and getting it, while others are selling the identical grade at from $1.40 to $1.50.

Steam coals seem to be somewhat firmer, though it is doubtful whether this condition is due to improvement in the demand or to a decrease in the supply. No price changes of any importance have been recorded.

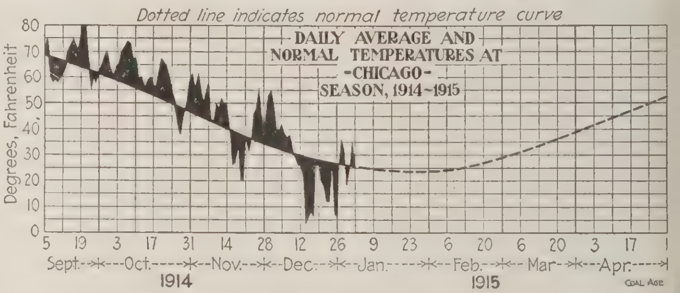
MIDDLE WESTERN

CHICAGO

General market conditions fairly strong, with screenings still buoyant. Anthracite trade active. Prices well maintained during holiday period.

The Indiana and Illinois mines received more orders during the past week than they could fill, due to lessened production over the holidays. Very little coal was mined on the day preceding New Year's, and all of the mines were shut down on New Year's day. This loss in tonnage had a stimulating effect on the market. While there has been no rush of buying, prices in general are holding steadily and the trend is upward. No complaints of car supply are made at the mines, and the movement of coal is fairly good for this time of year. Domestic lump in most cases is being quoted at list prices, and there is a general disposition to maintain these figures.

Considerable anthracite has been moved out of retail yards recently, and there has been marked buying to replace this. Quite a little individual anthracite is being offered in this market below circular prices, and most of it is of good preparation and quality, and consequently well received.



Pocahontas and New River coals are steady at prices previously quoted; Somerset smokeless has a firm tone.

Sullivan County and Clinton coals are in better demand, and the call for screenings has been brisk at high prices.

There has been an increase in circular prices quoted by Franklin County operators; a lively demand for these coals is noted, and the mine owners are looking forward to much activity in January.

Improvement is noted in the volume of sales of domestic coal from the Springfield district as well as in steam sizes. There have also been increased shipments for railroad use from this district.

The market for Hocking coals has been very steady, and it is probable that prices will advance because production seems to be restricted.

Prevailing quotations are as follows:

	Franklin Co.	Springfield	Sullivan	Clinton	Carterville

INDIANAPOLIS

Continued cold weather and mines are on full time schedules. Prices stiff but no higher except on slack. Indianapolis retail dealers advance prices 25c. a ton.

Continued cold weather has finally put the Indiana coal industry on normal footing. Mines are on full time, as far as railroad service will permit. The Pennsylvania lines are about the only ones giving full service to the operators. Prices are stiff, though no higher except on screenings, for which 85c. may now be quite easily obtained.

Retail dealers of this city raised prices at the beginning of the year 25c. a ton. They reportel cost at the mines stiffening, though not naming any actual advance. Operators say they have made no advances but that retailers can now find no bargain coal on the market and have to pay full prices. The new Indianapoils retail prices are:

Anthracite, chestnut	$8.50	Kanawha, lump forked	$4.75
Anthracite, egg and stove	8.25	Hocking, lump forked	4.75
Anthracite grate	8.00	Hocking, washed egg	5.00
Pocahontas, lump forked	6.25	Luhrig, lump forked	4.75
Pocahontas, lump shoveled	5.75	Luhrig, washed egg	5.00
Pocahontas, mine run	4.75	Linton No. 4, lump forked	3.75
Pocahontas, nut and slack	3.75	Indiana, lump forked	3.50
Blossburg, smithing	5.50	Indiana, lump and egg, screened	3.00
Cannel lump	6.50	Connellville, lump coke	6.50
Jackson (O.) forked	5.50	Indianapolis, by-product coke	6.50

ST. LOUIS

Market somewhat firmer, retail trade especially strong. Good domestic trade expected through the balance of the winter, but no immediate indications of any great improvement in the steam business.

The market is somewhat firmer on both domestic and steam sizes, especially from the outer district. The closing days of December were cold and dreary, causing a large consumption of coal, but it just keeps the market firm. Dealers report many orders, though in nearly every case they are small. The retail trade has no complaint. Coal from Williamson and Franklin County is in good demand, both for local and country use, and inquiries are plentiful. The steam market seems to be picking up in the way of tonnage, and several idle plants expect to resume before the middle of the month.

In the Standard field, steam sizes are still in good demand, and likely to continue so. The domestic market is not as satisfactory as it should be, but it has not weakened any, and indications are that it may get stronger in the next week or 10 days. The current outlook is considerably improved, and will be generally noticeable in the next three or four weeks. Coal operators, however, are not very optimistic of any immediate prosperity. They expect to have a few weeks of good business on account of the cold weather, but do not look forward to a resumption of business in a general way before several months.

Pennsylvania anthracite is moving in fairly good, with several inquiries, but smokeless is quiet.

	Williamson and Franklin Co.	Big Muddy	Mt. Olive	Standard	Sparta

Wholesale Pennsylvania anthracite chestnut, $7.55; egg and stove, $7.30; grate, $7.05.

KANSAS CITY

Retail trade is improved, but wholesalers' stocks continue large. Prices will probably remain unchanged all winter.

The fact that practically all the local retailers in Kansas City had large supplies of coal on hand previous to the present cold spell has handicapped the wholesalers and caused their sales to be lighter than the low temperature would warrant. This condition will probably be relieved in the very near future if the present favorable weather continues.

Conditions for the past four months have been very unusual, and most of the dealers, wholesalers especially, are inclined to be slightly discouraged. There is hardly a possibility that there will be any new price lists made during the current month and unless the weather is decidedly colder there will be none during the balance of the winter. Kansas coal is still selling steadily, and Illinois grades are stronger. Franklin County, Ill., coal which sold last week for $1.75 is now selling at $2.

PRODUCTION AND TRANSPORTATION STATISTICS

SOUTHWESTERN TONNAGE

The following is a comparative statement of the Southwestern tonnage for August and the preceding two months of the years 1913 and 1914:

	June		July		August	
State	1913	1914	1913	1914	1913	1914
Missouri	187,723	185,731	198,723	177,093	178,949	201,992
Kansas	412,371	490,561	465,761	513,312	451,968	453,675
Arkansas	145,306	133,350	163,185	117,016	178,904	157,803
Oklahoma	255,481	273,692	272,124	234,638	289,949	244,103
Totals	1,000,881	1,083,334	1,099,793	1,042,069	1,099,770	1,057,573

BALTIMORE & OHIO

The following is a statement of coal and coke tonnage moved over this system and affiliated lines during August, September and October of this year and last year:

	September		October		November	
	1914	1913	1914	1913	1914	1913
Coal	2,878,963	3,001,733	2,662,377	3,250,220	2,324,271	2,939,975

I. C. C. No. 5855—C. G. Blake Co. vs. Minneapolis, St. Paul & Sault Ste. Marie Ry. Co.

Reparation awarded on account of an unreasonable and unlawful practice affecting the receipt and charge for transportation of coal from Manitowoc, Wis., to St. Paul, Minn., due to the fact that the shipments were delivered to defendant by carriers from the mines in West Virginia in gondola cars, the sides of which exceeded 52 in. in height, and which defendant desires to keep off its line.

FREIGHT DECISION

Investigation and Suspension Docket No. 420—Switching charges on coal and coke within the Chicago switching district.

Proposed increased rates on bituminous coal and coke from points in Ohio, Pennsylvania, Virginia and West Virginia to Chicago & North Western stations, Peterson Ave., Crawford Ave., Weber and Greenwood St., not justified in full. Reasonable maximum rates prescribed.

FOREIGN MARKETS

GREAT BRITAIN

Deliveries slow and an acute shortage is developing. Raid of the German cruisers again disrupts the export business.

London, Dec. 24—The London coal trade continues very brisk. Colliery quotations are more or less withdrawn. Hundreds of loaded wagons are seriously delayed, and the depots are exceedingly short of coal. The colder weather has increased the public orders, but the shortage is creating serious difficulties.

No sooner do the prospects of the coal exporting industry appear to improve than another burden is immediately placed upon it. The recent German raid has been the cause of the latest obstacle being placed in the path of successful business, as it is due to this that navigation in the North Sea has been restricted.

This is most felt by those ports on the Tyne and Wear, where prompt business has been brought to a standstill. At both markets forward inquiry is very strong, and prices have stiffened. The inland trade markets are again brisk. In Lancashire, Yorkshire and Derbyshire the strong tone of a week ago has been maintained. The Scottish coal trade continues to improve, and is exceedingly brisk.—"The Colliery Guardian."

Coal Contracts Pending

Contracts listed in this department are authoritative in every respect except where the source of information is questionable in which event it is noted. All contracts are listed promptly on receipt and only repeated when additional information becomes available or in the last issue previous to the day on which bids will be closed. Liberal remuneration will be paid for all legitimate notices of this kind sent in.

◆

Contract No. 28—Brooklyn, N. Y.—The bids on this contract (p. 1009, Vol. 6), which provide for furnishing and delivering coal were as follows:

SCHEDULE NO. 1, for 9,678,000 lb. of anthracite coal to the various public buildings, baths, courts and comfort stations, Borough of Brooklyn: J. F. Schmadke, $27,144; Bacon Coal Co., $25,302; Sackett Coal Co., $25,805.52; Thomas W. Woods' Sons, $24,714.93.

SCHEDULE NO. 2, for 8,586,000 lb. of anthracite coal to the various public buildings, etc., Borough of Brooklyn: Bacon Coal Co., $22,368.24; Thomas W. Woods' Sons, 21,359.41.

SCHEDULE NO. 3, for 3,692,000 lb. of anthracite coal to the various public buildings, etc., Borough of Brooklyn: Thomas Woods' Sons, $7981.86; Bacon Coal Co., $8197.04.

Address Bureau of Public Buildings and Offices, Room 1003, No. 50 Court St., Borough of Brooklyn.

Contract No 30—New York—The bids on this contract (p. 1009, Vol. 6), which provides for furnishing and delivering 2,000,000 lb. of anthracite pea coal No. 1 for the Botanical Gardens, Borough of Bronx, were as follows per thousand pounds: Burns Bros., $2.27; Chas. D. Norton, Inc., $2.21; O. J. Stephens, $2.22. Address Department of Parks, Municipal Building, Manhattan, N. Y.

Contract No. 35—New York—The bids on this contract (p. 1048, Vol. 6), which provides for furnishing fuel supplies under specification No. 2 were as follows:

7000 TONS NO. 1 BUCKWHEAT—Garfield Proctor Coal Co., $3.31; George D. Harris & Co., $2.79; Pattison & Bowns, $2.97; Meeker & Co., $2.86; John M. Peale, $3.05; Charles D. Norton & Co., $2.74.

700 TONS PEA COAL—Meyer-Denker-Sinram Co., $4.95; Garfield Proctor Coal Co., $4.67; Charles D. Norton & Co., $4.39.

800 TONS NO. 1 BUCKWHEAT—Meyer-Denker-Sinram Co., $4.25; Olin J. Stephens, Inc., $3.57; Garfield Proctor Coal Co., $3.61; Meeker & Co., $3.38; John S. Conabeer, $3.50; John M. Peale, $3.38; Charles D. Norton & Co., $3.13.

750 TONS NO. 1 BUCKWHEAT—Olin J. Stephens, Inc., $3.94; Garfield Proctor Coal Co., $4.05; Meeker & Co., $3.82; John M. Peale, $3.90; Charles D. Norton & Co., $3.69.

Address the Auditor, Bellevue Hospital, 400 E. 29th St., New York City.

Contract No. 41—New York—Sealed bids will be received by the Commissioner of Bridges until 2 p.m., Jan. 7, for furnishing and delivering anthracite coal to the Brooklyn Bridge. The amount of security required is 30 per cent. of the amount of the bid, and deliveries are to be completed within 70 days after closing of the contract. Blank forms and further information may be obtained at the office of the Department of Bridges, Municipal Building, Manhattan. F. J. H. Kracke is Bridge Commissioner.

Contract No. 42—New York—Sealed bids will be received by the Board of Trustees or the Curator of the College of the City of New York, until 2 p.m., Jan. 13, for furnishing and delivering the following: Under Contract No. 1, 1000 gross tons more or less of No. 1 buckwheat coal at Amsterdam Ave. and 139th St.; under Contract No. 2, 600 tons more or less of No. 3 buckwheat coal and 200 gross tons more or less of semibituminous run-of-mine coal at Amsterdam Ave. and 139th St. The above contracts are to be bid on separately, and will be completed July 15. The amount of security required is 30 per cent. of the amount of the bid. Further information may be obtained at the office of the Curator of the College, Room 114, Main Building, 139th St. and Convent Ave., New York City.

Contract No. 43—New York—Bids will be received by the Park Board, Department of Parks, until 3 p.m., **Jan. 14**, for furnishing and delivering coal. The security required will be not less than 1½ per cent. of the amount of bid, and the bond will be 30 per cent. of the total amount for which the contract is awarded. Blank forms and further information may be obtained at the office of the Department of Parks, Municipal Building, Manhattan, N. Y.

Contract No. 44—New York—Sealed bids will be received by Borough of Bronx, until 10:30 a.m., Jan. 11, for furnishing and delivering white ash anthracite coal. The security required is 30 per cent. of the bid, and the contract is to be completed before Mar. 31. Blank forms and further information may be had at the office of President Douglas Mathewson, Municipal Building, Crotona Park, 177th St. and 3d Ave., Bronx, N. Y.

Contract No. 45—McKinney, Texas—The McKinney Water & Light Department will be in the market for about 3000 tons of slack coal about the first of next month. The contract is made on a competitive basis, and is usually closed at about $2.70 f.o.b. the power plant. Address the McKinney Water & Light Department, McKinney, Texas.

CONTRACTS LET

Contract No. 22—Philadelphia, Penn.—Awards on this contract (pp. 933, 972, 1009, 1048, Vol. 6, p. 39, Vol. 7) were as follows:

ROGERS-CORR CO., 47,000 tons of Lykens Valley buckwheat, $3.59; 47,000 tons White Ash buckwheat, $2.99.

WESTON DODSON & CO., 2000 tons Lykens Valley buckwheat, $3.35; 2000 tons White Ash buckwheat, $2.65.

EMMONS COAL MINING CO., 40,000 tons White Ash buckwheat, $2.38; 4000 tons of White Ash buckwheat, $2.50; 25,000 tons White Ash buckwheat, $2.60.

The last three items are for use at the city's pumping station, and water departments.

The requirements for schools, fire houses, etc., varying from 5 to 50 tons each, will be furnished by retail dealers at the different points contiguous to the places where they are required. The bituminous requirements aggregating 100,000 tons for use at the pumping stations at Lardner's Point, Shawmont, etc., were awarded to the Greensburg Coal Mining Co.

Address Director Loeb, Room 225, City Hall, Philadelphia, Penn.

Contract No. 29—Brooklyn—The bids on this contract (p. 1009, Vol. 6), which provides for furnishing and delivering 420 tons of stove coal and 225 tons of egg coal, were as follows: Frederick W. H. Nelson, $6.63, on both sections; Thos. W. Woods' Sons, Inc., for 420 tons stove coal, $6.18, and for 225 tons egg coal, $5.50 (awarded contract). Address Department of Parks, Borough of Brooklyn, or Department of Parks, Municipal Building, Borough of Manhattan, N. Y.

Contract No. 31—New York—The bids on this contract (p. 1009, Vol. 6), which provides for furnishing and delivering 600,000 lb. of egg coal No. 1 for the parks in the Borough of Bronx, were as follows per 1000 lb.: M. L. Bird, $3.14 for each section (awarded contract); Burns Bros., $3.38 on first section and $3.50 on other three sections; Olin J. Stephens, $3.37 on all four sections. Address Department of Parks, Municipal Building, Manhattan.

Contract No. 32—New York—This contract (pp. 1009, 1048, Vol. 6), has been awarded to Chas. O. Norton & Co., at $13,400. Address William Williams, Commissioner, Department of Water Supply, Gas & Electricity, Room 2351, Municipal Building, Manhattan.

Contract No. 36 A—New York—The bids on this contract (p. 1048, Vol. 6), which provides for furnishing and delivering 800 gross tons of buckwheat No. 3 and 400 gross tons of semi-bituminous coal at the Fire Department Building, were as follows: For 800 gross tons No. 3 buckwheat coal, Penn Fuel Co., $1.80 (awarded contract); Wm. Farrell & Sons, $2.30; Bacon Coal Co., $2.31; Henry C. Meeker, $2.52; Garfield & Proctor Coal Co., $2.32; Commercial Coal Co., $2.59; Gavin Rowe, $2.29. For 400 gross tons of semi-bituminous coal, Penn Fuel Co., $2.90 (awarded contract); Wm. Farrell & Sons, $3.30; Bacon Coal Co., $3.37; Henry C. Meeker, $3.87; Garfield & Proctor Coal Co., $3.25; Commercial Coal Co., $3.38; Gavin Rowe, $3.25. Address Department of Corrections, Municipal Building, Manhattan.

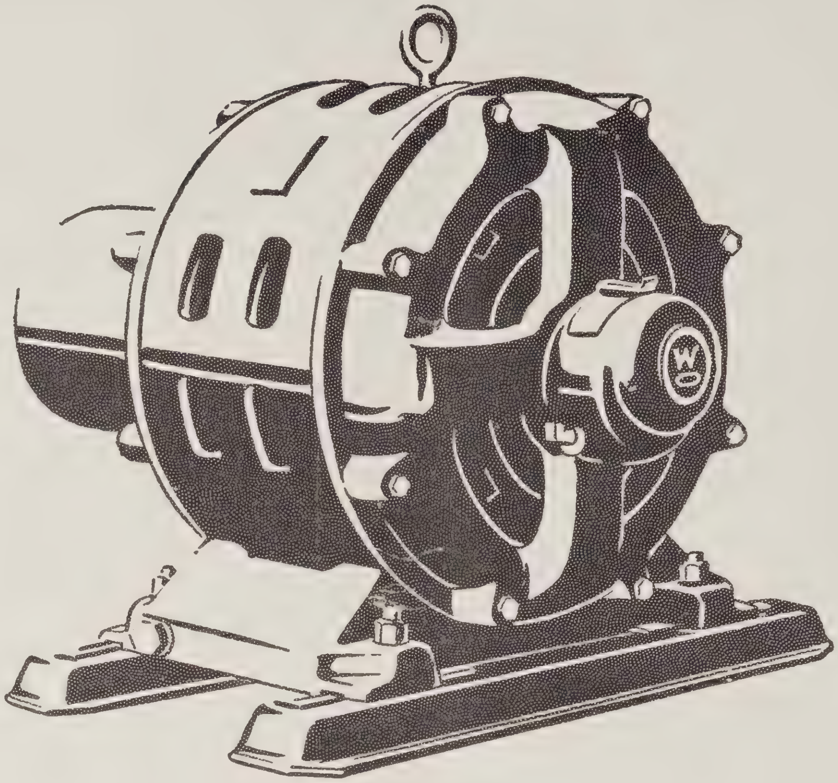
General Views at Mines of West Virginia-Pittsburg Coal Co., Collier, W. Va.



25 h. p. C S Motor.

Why the New Westinghouse C S is the Best Motor Ever Produced for Mine, Shop and Tipple Service

FORGED STEEL CONSTRUCTION—Frame and feet are of heavy forged open-hearth steel, thus providing great mechanical strength.

LARGE SHAFT—The shaft is unusually large in diameter. It is made of axle steel, which is 25 per cent. stronger than the machinery steel generally used for motor shafts.

RUGGED ROTOR—There is nothing about the rotor that can burn out, work loose, or deteriorate under the heat developed in service.

DUSTPROOF BEARINGS—Ample in size; interchangeable.

NO VENTILATING DUCTS—Low operating temperatures are obtained without ventilating ducts. No danger of burn-outs because of clogged passages.

LARGE AIRGAPS—Larger than those of any other motors on the market. No airgap adjusting devices needed or used.

HIGH EFFICIENCY AND POWER FACTOR—Higher than that of any other line of motors on the market.

EASILY REPAIRED—The bearings are the only wearing parts and their natural life is several years. When worn out it is cheaper to renew them than rebabbitt them, although this can be easily done if desired. Renewals of all other parts can be easily made in case of accidental damage.

COMPLETE LINE—These motors are made in all commercial sizes and speeds for all commerical polyphase circuits and for all constant speed series. Send for full information.

THE WEEKLY AD-TALK PAGE

Another Definition

"Advertising," said a speaker at a great business men's dinner, "is merchandising by wireless — suggesting comforts and necessities before the need is born—creating new markets—building new factories—selling the surplus."

Likewise, advertising makes for better furnished homes, better dressed people, purer food, better health, greater comfort, better equipped shops, improved methods, a happier and more efficient industrial community, bigger life.

And, incidentally, advertising makes the advertiser a bigger, broader man; likewise, the reader of advertising.

COAL AGE

Vol. 7 NEW YORK, JANUARY 16, 1915 No. 3

A Reward for Bravery

Is it not about time that some one was suggesting a suitable method of rewarding the individual bravery displayed in mine rescue work?

THIS thought took possession of us in reading some of the accounts of results obtained by the German Kaiser in distributing Iron Crosses to his soldiers.

Following each mine disaster there is a call for volunteers and as a rule the call is not in vain. The men who willingly risk their lives at such times are not fired by patriotic motives such as move soldiers to enlist for the protection of a Fatherland, but they are carried forward by humanitarian impulses which they do not stop to question.

Such promptings do not incite sensible men toward acts of foolhardiness, but affect such men exactly as does the call of patriotism; and the same rewards that are suitable for patriotism can be safely applied to them.

In considering the possibilities of such a system, we should not lose sight of the fact that at the present time there is little co-operation between first-aid teams in different states or even in different sections, and this condition is also true to a degree between outsiders and the rescue men in the employ of the Bureau of Mines. Very often jealousies spring up when several different crews offer their services simultaneously, and as a result things happen that not only affect the efficiency of the rescue work, but often endanger unnecessarily the lives of the men.

WON'T *Coal Age readers make suggestions as to some feasible plan for properly rewarding the brave men who do deeds of heroism in our coal mines*

?

In working up a system of rewards, opportunity would be presented for perfecting a National organization to deal with just such problems, since the prestige offered by recognition from a National body would appeal to every one, and make such an organization possible.

It might be that nothing more binding than precedent could be offered in lieu of fixed rules and regulations to govern rescue teams in different States and the U. S. Government men, but even well-established precedent openly published would be better than the present uncertainty.

It is a fact that just now any coal operator might feel justified in preventing even a U. S. Bureau of Mines instructor from entering his mine, following an explosion, if he felt so inclined.

First-aid contests offer some encouragement and are an incentive to men hesitating about spending the necessary time required to complete a course of rescue training; however such contests can never appeal to a fellow's imagination as would medals won by acts of bravery in actual service.

But a first-aid meet provides an excellent opportunity for the display of honors won, and even heroes enjoy the experience of receiving public approval.

A Tour through European Coal Mines--III

By Samuel Dean*

SYNOPSIS—Belgians recommend stone dusting. Systematic timbering generally employed. Miners' wages much less than in America. Girls employed to pick slate.

With regard to mine fatalities in Belgium, a paper was issued recently by Messrs. Watteyne and Breyre, in which it was shown that fatalities decreased continuously from 1881 to 1910, until the rate was 0.992 per thousand employed (inside and outside included), which is a world's record.

There was a remarkable diminution in fatalities caused by ignitions of firedamp and coal dust, the figures being 0.437 per thousand between 1881 and 1890, 0.28 between 1891 and 1900, and 0.077 between 1901 and 1910. The causes of accidents in connection with gas and dust, in the last period of 10 years, were: Ignition by electric lamps, 0.011; explosions, 0.025; asphyxia by normal evolution of gas, 0.014; sudden outbursts, 0.027.

The authors of the report attribute these results to the use of permissible powders, which have been used to a much larger extent than the law demanded. Strong warnings were issued against exceeding the charge limit of these explosives.

1—Girls Employed as Slate Pickers. 2—Another Group of French Women Who Work as Slate Pickers. 3—French Bosses. Note the Linen Cap Worn under a Leather Hat. Woman on Right Is the Bath Attendant. 4—Typical French Miner. 5—First-Aid Man and Slate Pickers

Prevention of Dust Explosions

For the purpose of reducing accidents due to explosions of coal dust, Watteyne strongly recommends local and concentrated schistification (shale dusting and arresting barriers), the use of lamps having a high degree of security, and of explosives of proved safety in the presence of both gas and dust.

Four years ago Lemaire experimented with incandescent lamp filaments at the Frameries testing station in Belgium, and proved that breakage of the globe, with either carbon or metal filament, was dangerous in an explosive mixture. Tests were made with 2- and 4-volt lamps in currents containing 7½ to 10 per cent. of methane, and having speeds of 2 to 33 ft. per second.

Methods of Working in Belgium

I am only able to deal briefly with methods of working coal seams in Belgium; no matter what the system is, the goaf is always packed tight with rock or other material. The practice of hydraulic filling has increased every year, and the same may be said concerning Germany and France.

---

*Delagua, Colo.

Galvanized-Steel Cars Used in French Mines

40-Ton Coal Car Used on French Railroads

The method of working a 9-ft. seam of coal near Lens, in France, may be of interest. The seam is first blocked out in pillars 300x900 ft. (Fig. 1), the single headings, 9 ft. wide, being ventilated by means of 2-ft. diameter pipes and small fans driven by compressed air. Slices of coal 9 ft. wide are taken off the pillars until all the coal is removed, these 9-ft. places being driven to the rise as the goaf formed by the previous slice is filled with rock (Fig. 2).

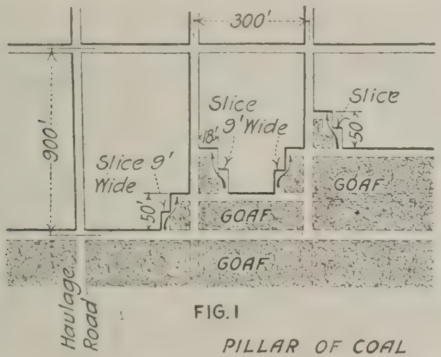

FIG. 1

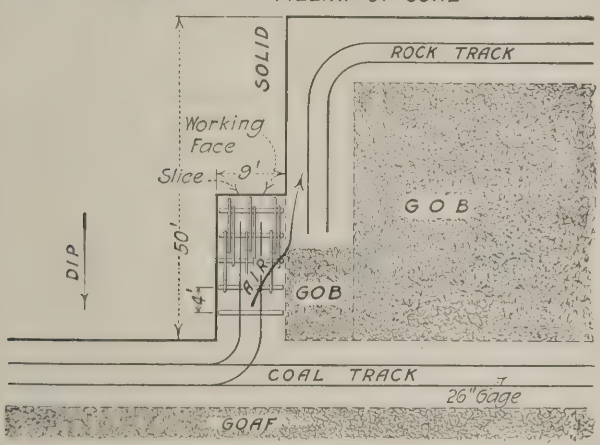

FIG. 2

Showing Methods of Mining in France

Timbering Kept Close to Face

The cars containing the rock are brought down hill from another district, or another mine, and in some instances from the surface. The cars containing the coal also travel down hill to the shaft bottom, the haulageways being so arranged that the grade is always in favor of the loads. The roof is supported by cross-bars 4 ft. apart with three lagging pieces overhead, these pieces being driven ahead as the face advances, after the manner of forepoling, until there is room for another cross-bar against the face 4 ft. from the last one. Thus the miner never works under wholly unsupported roof.

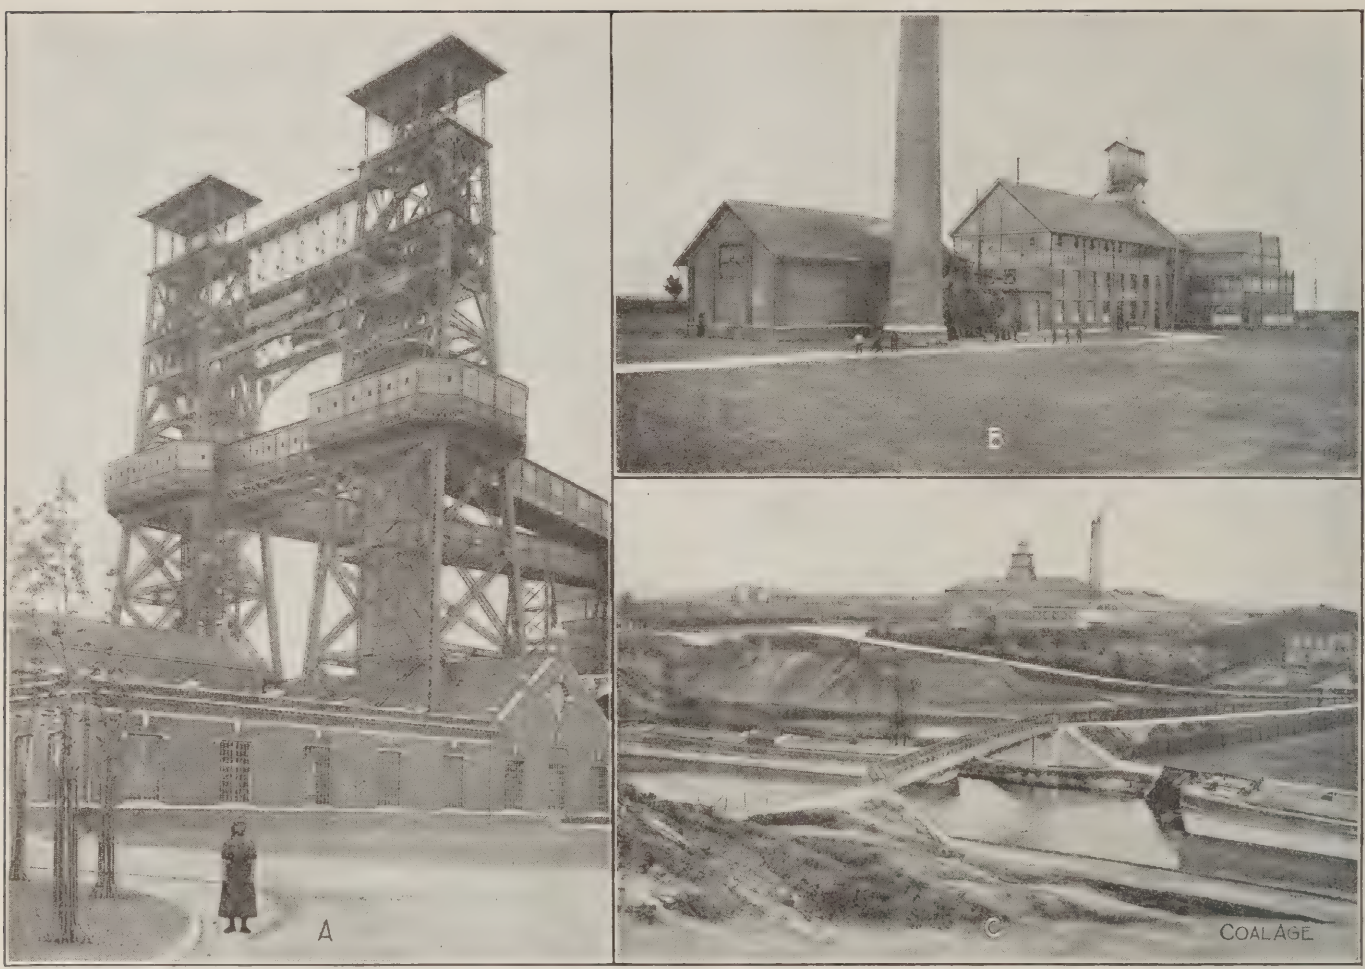
This is the general method of timbering at the face in the mines of France, and the term "systematic timbering" sprang into prominence after a visit which Henry Hall, a British mine inspector, paid to French mines many years ago; but even today no systems of timbering, anywhere, are in advance of the French method, and it may be added that few, if any, are more costly. But the condition of the mine roofs justifies this elaborate system of timbering.

Wages Paid Miners

In this 9-ft. seam, the miners are paid 32c. a ton for mining, loading, timbering their places and laying track. The capacity of the cars is 1200 lb.; they are of galvanized steel and being without end doors are consequently dust-proof.

Colliery No. 12 at Lens, France

Conveying Cars under Tipple



A—Steel Headframe at No. 15 Colliery, Lens, France. B—No. 14 Colliery of the Coal Mining Company of Lens. C—No. 8 Colliery at Lens

Miners average about $1.50 a day (8 hours). Contract company men average about $1.25 a day; these men are paid 20c. per cu.yd. for packing the goaf with rock, which includes hauling the material from other parts of the mine.

Props and cross-bars are not withdrawn from the goaf, and timber costs are often more than 25c. per ton.

Laborers on the surface are paid $1.20 per 10-hr. shift.

The workmen are provided with attractive, well built homes, each house having a large garden. House rent is surprisingly low, being only $1.30 per month for a five-roomed house with garden and necessary out-houses. Workmen are supplied with free coal.

A single man can get room and board for 40c. a day, so that although wages are low, the cost of living is correspondingly cheap, and to me there is always something strange about this, because some foodstuffs are imported, freight rates are high, and the cost of fuel in the country is high. The selling price of coal at the mines is $4 and over per ton.

Amusement Hall for Employees at Lens

No. 13 Colliery at Lens, France

There was a shortage of miners in France, and in the Lens district 25 per cent. more men were needed.

Girls are employed picking slate in the screens, and also work in the safety-lamp rooms. In this connection it may be said that the famed beauties of Paris do not compare with the unadorned beauty seen on the tipples, but as far as I could observe, there was no levity, or lack of discipline at the mines.

UNIQUE SURFACE PLANT

A photograph is shown of the steel headframes over the pits at the No. 15 colliery belonging to the Mining Company of Lens. There are two shafts, upcast and downcast, each 16 ft. diameter circular, and 82 ft. apart. These were sunk by the freezing process and are about 1000 ft. and 850 ft. deep, respectively.

Electric hoists have been installed and the whole of the machinery on the surface is operated electrically.

The mouths of the shafts are 82 ft. below the level of the railroad tracks, and lattice-girder bridges, 106 ft. high, communicate with the screens over the tracks. The bridges are covered with metal panels and glazed windows. The height to the top of the pulleys in the headframes is 214 ft., and to the top of the roofs over the pulleys, 230 ft. The cars are hauled to and from the screens by means of an endless chain.

MODERN SHAFT-SINKING METHODS

I cannot close this article without referring to the excellent work done in recent years by the technical mining men, in connection with shaft sinking through heavily watered, and sandy running strata. In 1904 an engineer named Portier successfully applied the cementation process for stopping fissures in the chalk sides of a shaft in the North of France, and since then this method has been successful in different parts of the world. Cementation has also been resorted to for insuring the success of the freezing process.

*

Extracts from a Superintendent's Diary

About once a year we manage to have an entertainment that is intended for and is embraced by most of the families of our community. It may be an open meeting of one of our lodges, or a church festival, or a union celebration; be that as it may, word travels out that everyone is to have a good time, with plenty to eat and everyone proceeds to come.

There have been times when we have had several open entertainments in one year, but, as a rule, one only succeeds. The reason for this is not very difficult to discover.

The women of our community, like the women in all other mining villages (and men, perhaps, if the truth were known), have a desire to display their finery to all of the other women of the community and likewise crave an opportunity to examine the "fine feathers" of the other women.

An open entertainment naturally offers the best opportunity for such display, and as most of these women must content themselves with one "dress-up" dress each season, one entertainment per year suffices.

Nor are dresses the only things that are subject to "dress parade" during these gatherings. Some sort of informal supper is generally served and this gives each of the ladies a chance to contribute her favorite omelet, or cake, or pickle for the approval of the camp's fastidious epicures and in return she is allowed to pass judgment on her neighbors' offerings.

It always happens that there are plenty of children on hand to devour the pies, cakes and jams; a fortunate circumstance since there are generally a dozen dessert courses to each meat and sandwich offering.

Some of the men in attendance begin to pass knowing winks down the line as soon as the kids get interested in the pies to such an extent that their mothers find it necessary to watch them; a few moments later groups of thirsty men spring up outside of the hall and a bottle or two is quickly emptied.

These old offenders always manage to get back before they are missed, however, and while the children are gobbling up the last piece of pie, they manage to empty all of the pickle dishes.

After the tables are cleared, further opportunities for displaying and comparing talents are offered.

Songs, recitations, impromptu speeches, musical numbers, etc., are called for and every one is given a chance.

One of the circumstances that adds to the interest of these gatherings is the number of different nationalities represented. This fact leads to heated and yet withal interesting discussions as to how this or that would be done in the old country, and the various viewpoints suggested preclude the possibility of any one going away with too high an opinion of himself.

For two weeks our camp has been making preparations for the first open meeting of our first-aid organization, which is to be held tonight. As this happens to be the first suggested entertainment of the season, word has gone out that it will be the event of the year. Since the first-aid team will, no doubt, insist on giving a little exhibition, we will have oratory, mirth, and music alternating with demonstrations of how to handle the wounded and the dying. And no one will consider the program unusual or out of tune. We take our pleasures seriously and can even find entertainment in criticizing methods of assisting the wounded.

*

New River Operators Honor Retiring Officers

As a compliment to the retiring president, Wm. McKell, and the retiring secretary, W. R. J. Zimmerman, the New River Coal Association served an elaborate banquet at the Dunglen Hotel, at Thurmond, on the evening of Jan. 5, when a handsome and beautifully engraved gold watch was presented to each of the retiring officers. A large number of the members of the Association were present. The presentation addresses were made by Hon. Jos. H. Gaines and R. S. Spilman, of Charleston, the former also acting as toastmaster.

Happy after-dinner talks were made by Hon. C. W. Dillon, on "How Legislatures Do So Much," Hon. H. W. McGinnis on "Raleigh County," John Laing on "Safety First," R. T. Hubbard, Jr., on "The Law and the Profits," and Attorney-General A. A. Lilly.

The newly elected officers of the Association are C. C. Beury, president; Wm. McKell, vice-president; N. S. Blake, secretary and treasurer.

Rescue Operations after Royalton Explosion and Their Lessons

By Oscar Cartlidge*

SYNOPSIS—The rescue work at the Royalton explosion was performed almost entirely by the aid of breathing apparatus, the wearers utilizing their outfits for almost the full time limit. The only failure was due to a chance being taken with spent apparatus. Crude American soda was used in the Fleuss apparatus instead of the imported article. Need for more safety lamps and electric lamps and better identification tags was made manifest. By reason of the use of breathing apparatus and the absence of fire, the mine was practically recovered in less than 20 hours.

The recovery of the mine after the explosion at Royalton was the occasion of much successful work, conducted largely by men in breathing apparatus, the bodies of all but about thirteen of the total of fifty-two having been carried back to the base by men so equipped. This work was done by the rescue teams of the Illinois Mine-Rescue Commission and of the Madison Coal Corporation. The cars of the Bureau of Mines took no part in the work.

The Benton Mine-Rescue Car and Rescue Station

This is stated to show that the hope of the director of the federal bureau has been fully justified, and Illinois is now in position to give adequate assistance in case of such unfortunate disasters. The rescue work proceeded without a hitch, and the apparatus proved to be equal to the full time of service for which it was rated.

The explosion in the North Mine at Royalton, Ill., Oct. 27, 1914, occurred at about 7:35 a.m., just after the men—in all 346—had been lowered into the mine for the day's work. A few were still on the bottom, and others were on their way down the entries to their respective working places.

A Few Preliminary Facts

Charles A. Sine, general superintendent, had just reached the bottom on a tour of investigation, and. strange to say, he was only bruised and shaken up while others near-by were killed. He was out directing the work of mine recovery on the following day.

The mine is about 325 ft. deep, has been in operation nearly five years and has an average output of 3000 tons per day of eight hours. It is worked by the room-and-pillar method. The coal is about 9 ft. thick, 7 ft. being taken in the advance and the remaining 2 ft. of top coal being drawn after the rooms are extended their full length.

The explosion was confined to the northwest section of the workings, and presumably was the result of a body of gas being ignited by coming in contact with an open light, as safety lamps were not used.

The call for help reached the Benton station, through State Inspector of Mines George L. Morgan, at about 8 a.m. Benton is about 20 miles northeast of Royalton, and the roads being good, the trip was made by automobile, part of the crew arriving and being in the mine at 11 a.m.

Many Lives Saved by Reversal of Air

Preceding their arrival, the mine manager, James Brown, and others, who were on top at the time of the explosion, descended into the mine and brought out the wounded and those in the unaffected area. Before going below, Mr. Brown, we understand, had the air reversed, making the hoisting shaft the downcast. At the time of the explosion the air was being forced into the mine at the escapement shaft.

I have no personal knowledge of the manager's reasons for this action, but I assume that he knew in what part of the mine the explosion originated and also that there were many men at the shaft bottom and along the main entry on the way to the interior. I have no hesitancy in saying that this reversal of the air current saved many lives. Two men, however, found near and to the east of the escapement or first and second west may have perished because the direction of the air was changed. An inspection of the map will show that reversing the air caused the noxious gases to return directly to the air shaft, principally over that part of the mine that had been worked out and abandoned.

Details of the Rescue Work

In the first party that descended into the mine at 11 a.m., was W. L. Morgan, inspector; Edward Laughron, county inspector; James Brown, mine manager; Dr. Springs, colored;

---

*Manager of mine-rescue stations of Mine-Rescue Station Commission, Springfield, Ill.

NOTE—A detailed account of this explosion appeared in our issue of Nov. 7, 1914.

Shep Clayton, miner; James Towal, superintendent, Benton Rescue Station; M. J. Carraher and Walter Nichols, assistants of the Benton Station. The three latter carried breathing apparatus. All in the party were able to get to within one hundred feet of the air shaft by the heading on the west side of the shaft. At this point they encountered bad air, whereupon Messrs. Towal, Carraher and Nichols explored to the air shaft with apparatus, but discovered no bodies.

They then all returned to the main shaft; went up the main east entry to the main north, and up the main north to the fourth west off the main north. Up to this point ventilation was fairly good and but little disturbance evident, except at the east side of the shaft bottom, where a large pile of rubbish had been thrown up against the loaded cars. This material had evidently come from the west.

Clothes Completely Stripped from Victims

Leaving the rest of the party at the fourth west off the main north, where foul air was again encountered, the men with breathing apparatus proceeded up the fourth west to a point about one hundred feet from the first north off the fourth west, where one body was found, and about fifty feet inbye, two more. The clothes were stripped completely off the bodies, except that the trousers of one man were still hanging over the shoes.

At the first north off the fourth west they found a car turned upside down with two bodies, much mutilated, lying on top. Another body was found inside of the second north.

The rescuers next explored the crosscuts between the first and second north and carried three bodies to the fourth west, where men without breathing apparatus took them to the shaft. This party then returned to the surface, and the rescue team of the Madison Coal Corporation, Dewmaine, John Lyons, captain, having arrived with its equipment, a first team composed of Towal, Carraher, Dixon, Hudson and George Clayton, and a second team comprising Nichols, Lyons, Hawley, Hooper and Bass (the last three colored) proceeded to a point where the first two men were found. Here a base for further operations was established.

Supporting this breathing-apparatus squad, was a crew to reestablish ventilation temporarily. This included James Dunn, Thomas Carraher, E. Laughron, A. J. Skelton, James Brown, Shep Clayton, John Duncan, R. P. Medill, Thomas Watts, Evan D. John, John Eddy, Bernard Cosgrove, Charles Story, John Nutall, James Forrester, William Burton, George Bagwill and Dr. Springs, all mining men in the southern end of the state.

Before going inside, a curtain was hung on the west side of the shaft across the main entry, one in the "forty-five" to the east of the shaft, and a regulator curtain was placed in the main east at the first south, for the purpose of forcing more air to the base of operations.

More Rescuemen Available Than Needed

At about this time I arrived from Springfield. After consulting with the state inspector, the superintendent of the Benton station and the mine officials and learning that everything was progressing favorably, I concluded that we had enough rescuemen and equipment on the ground, counting the team that was on the way from Eldorado. It did not seem necessary to send for any of the state rescue cars. Subsequent events proved that this conclusion was justified.

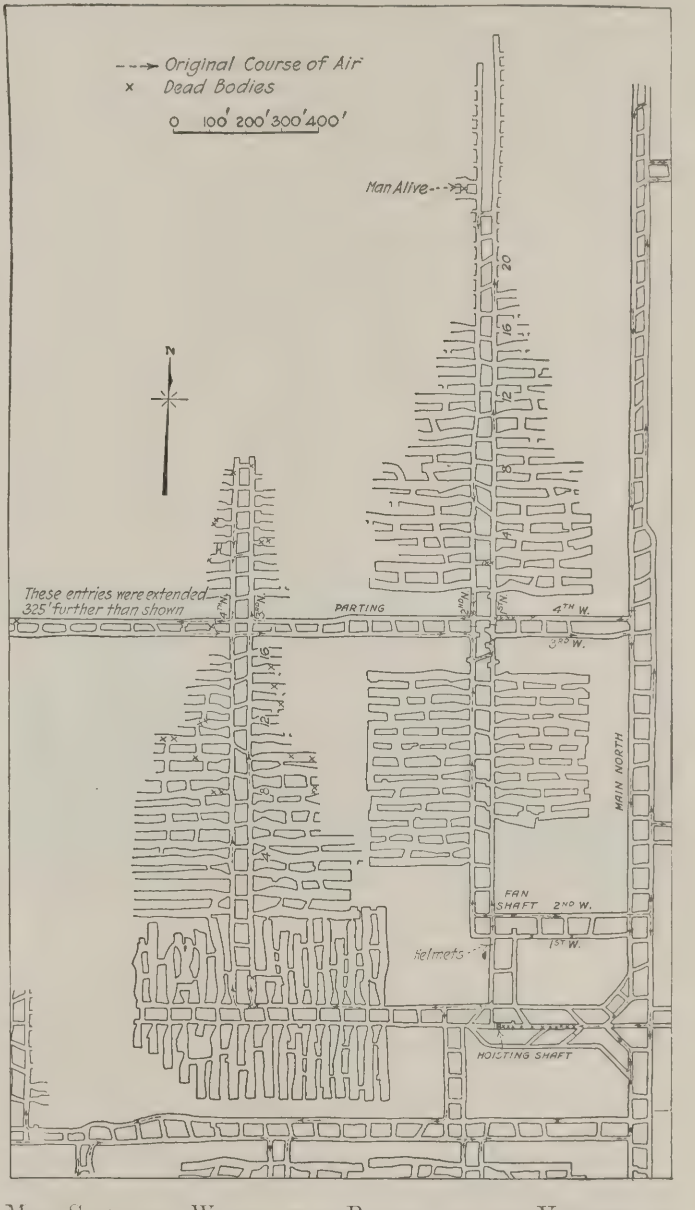
No one had at that time done anything to make stoppings of any permanence, and there was a dearth of lights, so we busied ourself in securing men to tighten stoppings, in procuring lights, extra oxygen, soda, etc., leaving Mr. Towal in charge of the inside rescue crews, while we alternated between the inside and back work.

Up to the point where the base was established the ventilation had been made fair with temporary stoppings. The first team donned breathing apparatus and explored the fourth west to the fourth north, went up the latter and out by the third north. Eight bodies were found on this trip.

Trips Occupying about 1¾ Hr.

The rescuers then ventured down the fourth south a short distance and then retreated by the third west to the base. No more bodies were seen. The parting on the fourth west was nearly blocked with cars, and much violence was indicated; the force of the explosion traveling toward the east in the third and fourth west, and toward the south in the third and fourth south. This fact suggested to us that the origin was probably in the third or fourth north. The trip occupied 1 hr. 45 min., and satisfied everybody that no fires resulted from the explosion.

The second team was then sent up the first and second north. This team explored all the rooms on the first that were standing, there being 35 turned. They then inspected 10 rooms on their return down the second north. In the crosscut between Rooms 25 and 24 of the latter heading a man who was still alive, but in a dazed condition, was found reclining on his powder box. His carbide lamp was burning at his side. Two of the squad returned to the base for assistance and carried the man to the first north where there was better air, due to the work of the temporary ventilation squads. He was brought out, and, I understand, has recovered. The man found at the door between the first and second north had a pinkish color, and the pulmotor was tried on him for possible signs of life, but to no avail. On this trip the men in the breathing apparatus traveled for 1 hr. and 40 min. in their helmets. While the rescue teams rested, the temporary ventilation squads worked in the first south and found three men.



Map Showing Where the Bodies of the Victims in the Royalton, Ill., Explosion Were Found

The breathing-apparatus squad reported that all stoppings between the first and second north were intact, and after the air had been turned into them, Messrs. Dunn, Johns and party explored the balance of the second without finding any dead.

A third breathing squad composed of part of the Dewmaine team and part of the Benton team explored to No. 12 room on the fourth south. On this trip three bodies were found, one at No. 13 under a car and two in No. 14. Four more were found later, farther in. It was now about six o'clock and the teams rested; the ventilating squads working up the fourth west.

One Man Suffers from Use of Depleted Apparatus

A mixed breathing squad composed of Dewmaine, Benton and Herrin men then carried bodies out of the third and fourth north to base, and then explored to face of the third and fourth west. This pair of entries is about 325 ft. farther in than the map indicates. Two bodies were found about three hundred feet from the face, and the squad carried them out, four men being detailed to each stretcher.

Nichols and team then started to explore the third and fourth south but only got a short distance when one of the team became sick and the men returned to the base. This sickness was due to using an apparatus that had previously been in service and in which the chemical had not been renewed, as it was thought that it would last for the short trip contemplated. Leaving the one man the other four returned and explored the fourth south returning up the third south. The O'Gara Coal Co.'s team having arrived from Eldorado, was then sent in under the captaincy of W. G. Taylor, to explore the rooms in the third and fourth south. They discovered and brought out eight bodies.

This ended the exploration of all the explosion area except the escapement entries. Fresh air was turned down this pair of headings, and two bodies were found. One near the escapement shaft and the other about one hundred feet outbye. One body was also found in the sump at the main shaft.

All But about Thirteen Bodies Recovered by Apparatus Men

It was now 5:30 a.m. of the day following the explosion. Forty-seven dead bodies had been removed from the mine by the rescuers, and all but two or three of those inside had been carried to fresh air by men wearing breathing apparatus. According to the records of the company two were still missing, but it was certain that if there were any others in the mine they were not alive. It not being necessary for breathing apparatus to be used further the general manager informed us that his men could handle the rest of the work, and the mine manager organized regular shifts for the cleaning up of the mine, with competent men in charge, and, while this was in progress five bodies were found. We stayed at the mine all of Oct. 28, and upon leaving left Mr. Nichols to stay as long as the mine manager wanted him.

The Car Shed and Rescue Station at Benton, Ill.

The dead were located as follows: Ten at the shaft bottom; 5 in fourth west up to the first north; 3 in the first and second north; 3 in the first south; 8 in the third and fourth north; 2 in the third and fourth west, past second north; 8 in the third south; 7 in the fourth south; 2 in the back west at third south; 2 in the first west or escapement road; 1 in the first west off the main south; 1 in the sump. This totals to 52 men.

The barometer at Royalton, at 7:30 a.m., registered as follows, the readings being corrected to a sea-level basis: Oct. 26, 29.98 in.; Oct. 27, 30.42 in.; Oct. 28, 30.15 in. This indicates a rise of 0.44 in. in the 24 hr. preceding the explosion.

Conclusions

This was the first large explosion in Illinois since the establishment of the state mine-rescue stations, and we believe the exploration of the mine and the recovery of the dead in less than 24 hr. after the explosion occurred justify the efforts put forth by the Mine-Rescue Commission for the propagation throughout the state of mine rescue and first aid.

We have demonstrated the fact to our own satisfaction that breathing apparatus worn by trained men is of great value in exploration and the recovery of the dead after an explosion. It has been shown that the types of breathing apparatus used are practically safe when worn by experienced men, and that long exploration trips to locate the dead and living and ascertain the presence or absence of fires can be made in irrespirable air. We also found that crude caustic soda can be used for rescue work with the Fleuss apparatus, for our men used this absorbent exclusively.

We learned that there are not enough safety and electric lamps at the average Illinois mine, and suggest that every mining man who goes to an explosion should take with him all the lamps he can secure. We also learned that the reversal of the air current after an explosion is sometimes justified.

Every miner while underground should have fastened to his person an identification tag. Some of the bodies were practically without clothing, which goes to show that checks or other identification marks carried in the pockets are not reliable.

Two of the Eldorado team used Draeger 2-hr. apparatus, all the rest of the teams being equipped with the Fleuss outfit, designed for equally extended time of service.

All the men who wore the breathing outfits are, I believe, with the possible exception of Mr. Lyons, holders of Illinois Mine-Rescue Commission certificates.

In addition to the men previously mentioned in this article, much credit is due to James Reid and John McClintock, state mine inspectors; James Seymour, Joseph Morris and George Morris for their valuable assistance and advice.

*

Ventilating the Face of Entries

By M. D. Cooper*

When driving two parallel headings, ventilation is secured in both by making one the intake while the other acts as the return. At intervals, break-throughs are driven through the coal separating the headings, in order that the air current may travel from the intake to the return heading. As the work advances and a new break-through is completed, the preceding break-through is closed with a wooden, brick or concrete stopping. At times it becomes impossible to properly ventilate a heading by means of break-throughs alone, in which case a brattice must be constructed.

A good type of brattice is a partition of brattice cloth carried up from the last break-through. At that place, a door is hung across part of the entry in order to force the air current up one side of the brattice and back on the other side.

In Fig. 1, which shows the general arrangement for ventilating both headings in a two-entry system, the right entry is the intake, while the return air goes out through the left entry. Just outside of the break-through, a door *A* is located in the right entry. A line of posts is set from the door to a point about 20 ft. from the face. To the posts 6-in. ship-lap is nailed and the brattice cloth nailed in turn to the boards. The posts may be spaced according to the length of the boards, but in general if the distance between posts much exceeds 10 ft., the boards cannot be rigidly fastened and it becomes increasingly difficult to tighten the brattice to the roof.

---

*Ellsworth, Penn.

The air travels as indicated by arrows between the brattice *B* and the right rib, sweeps the face, returns between brattice *B* and the left rib, passes through the break-through, up along brattice *D* to the face of the left entry, and then out the left entry.

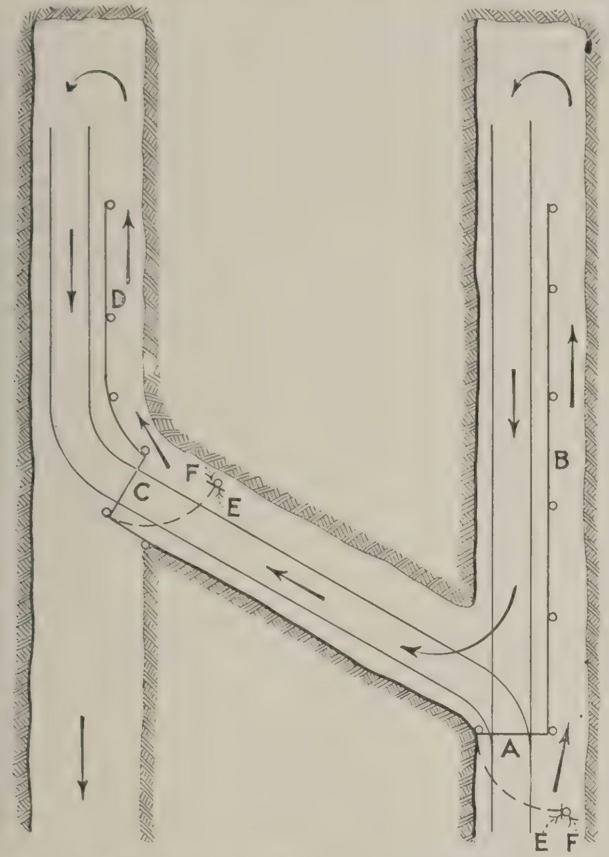


FIG. 1. VENTILATING ARRANGEMENTS OF THE TWO-ENTRY SYSTEM

In order to give a reasonable area on the narrow side of the brattice, it is best to have the entryman lay his track as near the rib as possible, while giving sufficient clearance for his cars. The air may be directed up either the wide or the narrow side of the brattice, but it is generally better practice to cause the intake air to travel the narrow side, as the restricted area increases the velocity of the air current, making it unnecessary to carry the brattice so close to the face as in locations where the intake must be the wide side. This results both in a saving of brattice and in giving greater freedom of movement to the entryman and machine runners.

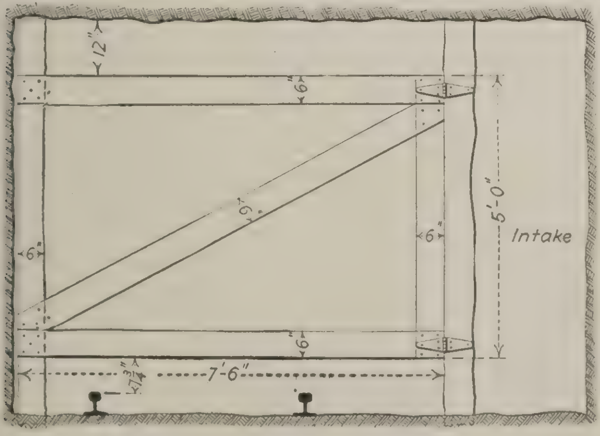

FIG. 2. A BRATTICE DOOR

BUILDING THE MINE DOORS

For use at *A* and *C*, Fig. 1, a simple door built of shiplap, and intended to be covered with brattice cloth, is shown in Fig. 2. This door is suitable for an entry 7 ft. high and 10 ft. wide, in which the track gage is 42 in. In building the door it is best to cut off the necessary boards to the required length, place the side boards across the track and the top and bottom boards in position over the first two. Then drive one nail in each corner, square the door by moving the corners until the diagonal distances are equal, attach the diagonal board, and tighten the door by driving three or four 6-d. nails into each corner and bending the points over. The post to which the door is hung must be slightly inclined toward the face of the entry in order that the door may swing closed by gravity after it is released.

The door is held open by means of a button *E*, Fig. 1, this being a short board attached by a 20-d. nail to the post *F*. Galvanized-iron strap hinges are used for attaching the door to its post, and it is better practice to use two or three 6-d. nails in each hole in the hinge, rather than one larger nail, for by so doing much time is saved when it becomes necessary to remove the hinge from the post.

If the height of the entry exceeds the width of the brattice cloth, the space between the boards supporting the cloth and the roof may be filled by cutting off strips of cloth of the proper width and fastening them by means of short sticks. The sticks are nailed to the boards at intervals of from 12 to 18 in., as shown in Fig. 3.

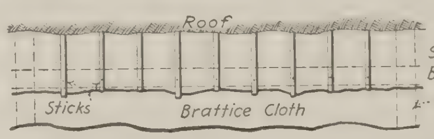

FIG. 3. METHOD OF EXTENDING THE BRATTICE TO THE ROOF

A brattice of this kind, if carefully erected, will prove quite satisfactory in conducting the air to the face. Moreover, when a new break-through is finished, the material may generally be recovered and used a second time.

⁂

Anthracite Shipments in 1914

Statistics show that the total shipments of anthracite from Pennsylvania last year were 68,342,601 long tons. This is 727,027 tons less coal than was shipped in 1913.

Total shipments of anthracite last month were 5,702,258 tons as against 5,662,618 tons in December, 1913, an increase of 39,640 tons. The amount of coal on hand at tidewater shipping ports decreased 141,365 tons, from 811,198 tons on Nov. 30 to 669,833 tons on Dec. 31.

The Lehigh Valley led in tonnage for the month with 1,055,349 tons; the Philadelphia & Reading was second with 954,827 tons; and the Lackawanna was third with 902,140 tons. The Central Railroad of New Jersey carried 710,604 tons, the Erie 703,037 tons, the Delaware & Hudson 641,952 tons, the Pennsylvania 530,200 tons and the New York, Ontario & Western 204,149 tons.

Coal Mining in Ohio during 1914

By J. M. Roan*

SYNOPSIS—Detailed account of the activities of the Industrial Commission of Ohio, Department of Inspection, Division of Mines, for the fiscal year ending Nov. 15, 1914. More than two-thirds of all accidents attributable to falls of roof.

The Mining Industry during the latter months of the year 1913, showed marked activity, and all indications pointed to a prosperous trade in the coal business for the year 1914. The mines during the early part of the year 1914, worked almost full time. On Apr. 1, 1914, the wage agreement between the miners and operators expired, and a large number of the mines in the state suspended operation until a new wage agreement could be entered into.

Run-of-Mine Law

The Run-of-Mine law passed February, 1914, and became operative 90 days after passage. This bill provided that every loader and miner of coal in the state, who, under the term of his employment, was to be paid for mining or loading such coal on the basis of the ton or other weight, should be paid for such mining or loading according to the total weight of his output.

This law put into effect a new basis on which wage agreements could be entered into between miners and operators of the state, as all previous wage agreements had been made on the basis of the ton or other weight of the amount of *lump coal* mined. On account of the provisions of this new law, it was a difficult matter for the miners and operators to come to any satisfactory agreement on a price based on *run-of-mine,* as conditions varied in different sections of the coal-producing districts of the state. In consequence, the coal industry of Ohio for the year 1914 was more or less demoralized, due to this changed system of mining. The industrial depression also served to lower the production and, as a consequence, the tonnage will probably show a decrease of 50 per cent.

During July, a number of conferences were held with the object in view of effecting a settlement, and agreeing upon a wage scale which would be satisfactory to both interests. Later on, district meetings were held, which resulted in several of the coal districts signing up agreements and resuming operations.

The Hocking Valley and Jackson County districts resumed operation about Aug. 1, as well as the Guernsey County district; many of the smaller coal areas are also in operation; however, eastern Ohio, which is the largest coal-producing district in the state, is still suspended.

Accidents

For the fiscal year ending Nov. 15, 1914, 76 fatal accidents were reported; from Nov. 16, 1913, to Dec. 31, 1913, 18 fatalities were reported; from Jan. 1, 1914, to Dec. 1, 1914, 59 fatalities were reported.

Causes to Which Accidents Were Attributable

For the fiscal year ending Nov. 15, 1913, to Nov. 15, 1914, the causes to which the fatal accidents were attributable were as follows: Falls of roof caused th death of 53 persons; mine cars, 11; motors, 5; minin machines, 2; premature explosions, 2; explosions of gas 1; electricity, 1; and miscellaneous, 1.

Measures of Safety

(a) *Safety Commissioner*—On Jan. 1, 1914, the Industrial Commission of Ohio appointed a safety commissioner of mines. This appointment was made with th object in view of reducing the number of fatalities in an around the mines and to devise any measures of safet that might be deemed advisable which would tend to lessen the number of accidents.

"Safety-First Consideration" was the slogan adopted The first publicity step taken into consideration by th safety commissioner was the issuing of monthly bulletins, giving an account of all the fatal accidents, a synopsis of all the facts and circumstances surrounding th death of each person, and comments made in regard to th manner by which the accidents might have been avoide or prevented.

(b) *Motor and Mule Trips*—Trip agreements regulating motor and mule haulage were also inaugurated This agreement provided for the regulation of the number of persons permitted to ride at any one time; fo the speed at which the trip should be run; for the prohib tion of carrying powder, and for the otherwise safe operation of the trip.

(c) *Reporting Conditions of Mines after a Long Su pension*—After a long suspension, such as was experience during the year owing to the operation of the Run-o Mine law and other industrial depression, mines ar liable to get into very unsafe condition from falls, accumu lations of gas, disarrangement of electric wires, the fillin up of refuge holes, etc. In consequence, this departmen issued a circular letter calling attention to these matte and requesting all mines to be thoroughly examined before being placed in operation. Especial attention wa called to the examination of all machinery, hoisting fans, hoisting signals, electric wires, refuge holes; in fac all mine equipment was to be thoroughly gone over and report made to the safety commissioner.

(d) *Solid Shooting*—In carrying out the provisio of Amended Section 976—1-2-3, of the mining law passed Feb. 5, 1914, relative to the method of minin known as "shooting off the solid," this department pr pared a list of questions which it was necessary for co companies to fill out and answer and return, together wi a petition to which was to be attached their own signatur as well as the the signatures of a majority of their em ployees, making request for mining coal by this metho

These questions and answers related to the followin Amount of powder used; size of bit used in drilling t hole; whether dynamite was used or cutting done; wheth squibs and fuse were both used, and reasons given as why it was necessary to mine the coal in this manner.

After these questions were fully answered to the enti satisfaction of the mining department, a permit was i sued, with fixed rules to govern this method of mining.

These rules regulated the amount of powder to be us and the spread of the bit. Dynamite was prohibited vell as excessive charges of powder; shots were to be fired n rotation, and in all mines where more than 15 men vere employed, all shots were to be fired at quitting time.

---

*Chief deputy and safety commissioner of mines, Columbus, Ohio.

(e) *Fireboss Reports*—Realizing the dangers encoun- ered in gaseous mines, this department prepared fireboss lank report books, which were mailed out to all mines nown to generate firedamp, and where firebosses were em- loyed. Coal companies were requested to have their fire- osses fill out these blanks daily in duplicate form, re- aining one report for their office records and mailing he other to the deputy mine inspector, in whose district he mine was located. After these reports have been gone ver by the deputy mine inspector, they are mailed to is office to be checked over and any suggestions offered hich may be deemed necessary. These blanks provide r reporting where gas was found, in what room or rooms, nd the number of the entry; also space was provided to eport other dangerous conditions, such as falls, bad p, etc. In this way the deputy inspector and this de- artment are kept in touch with the conditions of mines nown to generate firedamp, which are always considered e most dangerous.

(f) *Mine-Rescue Car*—One of the most important ctors relating to safety which the state has inaugurated as the purchase and equipment of a mine-rescue car. his car has already performed valuable service in a ine fire during the year, and in the reopening of a mine here a fire has originated and which had been sealed up r several months.

(g) *Oil and Gas Wells*—The law permitting oil and s wells to be drilled within the limits of coal-producing unties, although safeguarded by law, has caused serious ncern on account of some of them being drilled through al mines in operation, and proper precautions for safety t always being used in all cases.

So serious became the situation that a resolution was commended by this department and was adopted by the dustrial Commission of Ohio, July 6, 1914, requiring l oil- and gas-well companies to file a map, showing the cation of wells to be drilled, 10 days before commencing drill said well or wells.

Upon receipt of the proposed location, if satisfactory d in compliance with the statutes regulating same, a rmit is issued giving authority to drill these wells. is requirement met with opposition and disapproval many of the oil- and gas-well companies, and the mat- r was taken up with the Industrial Commission of Ohio. is conference resulted in a committee being appointed, nsisting of the representatives of three coal companies, ree representatives of oil- and gas-well companies, the ate geologist, a representative of the engineering de- rtment of the Ohio State University, and the commis- ner of safety and chief deputy of mines, division of nes, of the Industrial Commission of Ohio, acting as airman.

This committee was instructed to investigate the ques- n of oil and gas wells penetrating the coal-producing unties of the state from every angle, and was requested report to the Industrial Commission of Ohio some plan at would be satisfactory to all persons interested and ich would not work a hardship on the oil and gas com- nies. At the same time "safety" was not to be ignored, d the future operation of coal lands yet undeveloped s to be taken into consideration, and life and property tected.

(h) *Heating Mine Air*—Early in November this department issued a bulletin to operators, general superintendents, mine bosses and mine foremen, relative to dangers arising from cold weather, as the cold air entering the mine is warmed and absorbs moisture; it was also recommended that all dusty places be wet down. It was recommended that the air be heated to at least 40 to 45 deg. The method of carrying out this plan was left to the judgment of the mine managements, owing to local conditions varying in different parts of the state.

(i) *Checking Up the Deputy Inspector's Orders*—During the year this department put into operation a system of checking up all orders issued by the deputy mine inspectors to mine managements. In this way an order is followed up until complied with.

Mining Department Acts as Mediator

(j) *Matters of Arbitration and Conciliation*—During the year the safety commissioner and chief deputy have been called upon by the Industrial Commission of Ohio to act as arbitrators where disputes have arisen between employer and employees, and there has been difficulty in effecting a settlement. Chief of these was the settling of strikes in and around the brick plants and clay mines of the Shawnee and Straitsville districts, which, owing to disputes, had been suspended for about three months.

Operators and miners finally decided to arbitrate and requested the Industrial Commission of Ohio to name an arbitrator. This matter was referred to the mining department and all disputes were adjusted to the entire satisfaction of both employer and employee, and a three-year contract signed which covered in detail all classes of labor in and around the plants and coal mines. Many other local cases of arbitration have been disposed of by the mining department acting as mediator.

(k) *Rules and Regulations Affecting English and Non-English-Speaking Persons Employed in and around the Mines of the State*—Owing to the numerous fatal and nonfatal accidents in the State of Ohio, the greater number being attributable to carelessness and neglect on the part of the mine management and miners, the fact was brought to the attention of the Industrial Commission of Ohio, through the division of mines, that some of the laws of the state were, in many instances, being violated.

The mining department felt that a great many of the violations were due to the fact that mine managements, miners and men employed in general, did not familiarize themselves with the laws under which they labor; therefore, for the purpose of enlightening all nationalities in their own language, it was deemed advisable that excerpts of the mining laws be printed in pamphlet form and a set of rules attached thereto governing the different occupations in and around the mines, with a request that all familiarize themselves with the same in order to carry out the advice given, and as far as it is within the power of all those connected with mining in any way, to assist in seeing that the same is carried out.

The mining laws in condensed form, with rules, have been printed in the English language, and we expect soon to have them finished in the foreign languages, when they will be distributed to each and every person in and around the mines—superintendents, mine bosses, and all vested with authority, as well as miners and mine laborers.

Wolf Run Explosion

This explosion was of a most unusual nature and occurred at the Wolf Run mine, June 14, 1914, due to an explosion of firedamp. The fan, which was located at the top of a two-compartment shaft, and operated as a blower, had been shut down for a period of 16 days; during this time the mine filled with firedamp, the volume becoming so great that on this date it began to drift up the shaft, where a number of men were engaged in making repairs or alterations to the fan.

One of these men carried an open light into the fanhouse, igniting the gas. As the flame followed the column of firedamp down the shaft, the men ran from the fanhouse, escaping from the path of the explosion before its full force was manifested at the surface. Fortunately, all escaped serious injury, but two of them were slightly burned. Flame issued from this shaft in great volume and with considerable violence, igniting a pile of mine posts about 30 ft. from the shaft.

The greatest damage was done in the west part of the mine, a large number of stoppings in both live and abandoned workings were destroyed, and doors, tracks, timbering and wiring were displaced. The force of the explosion was manifested in the innermost workings, mine cars near the head of the workings being badly damaged. There was also some evidence of flame in some of the working places, but probably owing to a deficient supply of air, no fires resulted. The deficiency of air also probably prevented the explosion from being much more violent and destructive.

Following this explosion a number of conferences were held with the management and owners of the mine and plans discussed as to the best method of operating same to avoid similar explosions in the future.

Mine Fires

Superior No. 9 Mine Fire—On Mar. 1, 1914, the Industrial Commission of Ohio purchased a mine-rescue car for use by the department of inspection, division of mines, in mine-rescue work and for use in any emergency met with at mines, such as mine fires, explosions, or other mine catastrophes. This mine-rescue car has been fully equipped with helmets, resuscitating apparatus, and a small hospital fully equipped with first-aid outfits and surgical instruments. Hospital equipment on mine-rescue cars is a new feature and should prove of great benefit in cases of emergency.

Aug. 12 saw the Buckeye mine-rescue car on its initial trip, having received a call that the Superior No. 9 mine, located near Wellston, Jackson County, Ohio, and operated by the Superior Colliery Co., Detroit, Mich., was on fire, the tipple having been destroyed, and the fire extending to the timbers and coal on the bottom on the north side of the mine.

The fire occurred on Aug. 11, and the fire department at Wellston was called upon to assist in extinguishing the fire. The department responded and did excellent work. However, when the fire extended to the bottom, and there was fear that it would be difficult to control, the state rescue car was called and responded, arriving at the mine on the morning of Aug. 12, in charge of J. M. Roan, Chief Deputy and Safety Commissioner, and Assistant Chief Deputy J. C. Davies, who entered the mine at once upon arrival by slope or manway, and succeeded in reaching the fire.

After consultation it was decided to take the hose down the slope and up to the fire; from this position a stream of water was thrown on the flames for three hours, when the fire was under control. A force of men was then set to work to timber the run-a-round and make it safe in case it should be necessary to carry the hose on the south side of the mine.

A number of the deputy mine inspectors assisted in this work. On Aug. 13, it was discovered that the coal was on fire on the southwest side of this shaft, and it was extinguished by water thrown from the north side.

Aug. 14, another examination of this mine was made and no fire found. A. J. Lafferty, superintendent, U. S. Morris, general superintendent, Mr. Samuels, mine foreman for the company, and other employees of the mine rendered valuable service in fighting the fire.

Sunday Creek No. 301 Mine Fire—Aug. 16, 1914, the mine-rescue car was again called to assist the mine management of the Sunday Creek Co., Columbus, Ohio, in reopening their No. 301 mine, located at Congo, Perry County, Ohio. This mine experienced a serious mine fire Nov. 1, 1913, which was supposed to have been caused by electric wires. Several of the deputy mine inspectors were called upon at this time to assist Inspector Thos. S. Grogan, in whose district the mine was located.

The fire was located about 3000 ft. from the entrance to the mine. It was considered useless to try to extinguish the fire, and it was decided to seal it off. This work was attended with considerable danger, an explosion taking place while the work of construction was in progress. Fortunately, no one was injured, the workmen and those overseeing the work not having been in the direct line of the explosion. After further consultation it was agreed to be too dangerous an undertaking to continue the work of sealing off the mine in the locality in which the fire was located, and it was decided to seal the mine from the outside, which was done Nov. 9, 1913.

The mine having been sealed up entirely for a period of ten months, it was decided to reopen it to ascertain if the fire had been entirely extinguished, and the state rescue car arrived at the mine on Aug. 15, 1914, several of the deputy mine inspectors having been called to assist in the work.

August 17, 18 and 19, were spent in making ready to shoot the bottom of the shaft on the first north and third north entries, which was completed Aug. 20, 1914, and the fans placed in operation. An inspection was then made at the bottom of the shaft in the north third entry by Chief Deputy J. M. Roan, and Deputy Inspector L. D. Devore, when it was agreed that the fire territory would be explored that evening and that the helmets would be used for that purpose. At 10 o'clock each inspector, equipped with a helmet, entered the shaft. Inspectors Devore, Wheatley and Grogan were selected to lead the exploring party to where the fire territory was located. Chief Deputy and Safety Commission of Mines J. M. Roan, acted as a signal between the men making the examination and the reserve force of deputy inspectors, which was in the rear to act in case of emergency, if any accident should befall the exploring party.

Upon examination the fire was found to have been extinguished. On Aug. 21, the main shaft was cleaned out and an effort to remove the blackdamp from the mine was then in progress; this will require a great deal of time, as the mine has a large area, and there will be a number of stoppings to be built.

INSPECTIONS

Two thousand three hundred and fifty inspections were made by the 12 deputy mine inspectors, in addition to the inspections, joint conferences and investigations made by the chief and assistant deputies. Three hundred days were spent by the deputy inspectors and assistant chief deputy, in the oil- and gas-well fields looking up delinquent oil- and gas-well companies who were failing to carry out the provisions of the law relating to securing a permit to drill wells for oil and gas penetrating the coal-producing counties of the state; also witnessing the abandonment of oil and gas wells to see that they were plugged and sealed according to law.

FINES AND PROSECUTIONS

Fourteen prosecutions were reported to the department during the year; there may have been many more prosecutions brought by coal companies that have not yet come to the attention of this office. Of the number reported, eight were brought by coal companies against their employees, or loiterers, two by the deputy mine inspectors, and one by the safety commissioner of mines.

The most serious violations reported were for removing danger signals, nine in all. It does not seem that any miner or any other employee of a mine would become so careless or negligent of not only his own safety, but the safety of others, that he would remove a danger signal placed there by a fireboss making his examination in the morning before the men enter the mine. Violations for such causes as this cannot be too vigorously prosecuted and the full penalty assessed, no matter who the offending person may be.

One arrest was made for failure to supply props and timber by the mine management; one for a person entering a mine intoxicated; one for loitering around mine property, and one for violating the section relative to the use of motor haulage in mines; one for depositing calcium carbide on the inside of a mine. On Dec. 5, 1914, two men were prosecuted and fined for throwing back fine coal in a mine, contrary to the law.

MINING LEGISLATION

During the year the "Run-of-Mine" law was passed, regulating payment by weight for all coal mined; section 976—1, 2 and 3 of the mining code was amended, regulating the method of mining coal known as "shooting coal off the solid," and providing for a permit to be issued in all such cases based upon questions made out relative to the seam of coal; why it was necessary to so mine the coal; the amount of explosives used, etc.; this petition, requesting permission to shoot coal off the solid, was to be signed by the mine management and a majority of the miners employed at the mine desiring to mine the coal in this manner.

Section 934 of the mining laws was amended relative to mines at which ten or more persons were employed; for every 35 so employed, a waterproof blanket, a sufficient quantity of bandages and other linen and all other requisites were to be provided in case of accident; at mines known to generate firedamp, so as to be detected by a safety lamp, a sufficient quantity of olive and linseed oil is to be kept for use in emergency.

CONCLUSION

The Industrial Commission of Ohio has jurisdiction over a number of departments of state, of which the division of mines is one, and its powers are sweeping in effect. This commission has authority to enter any place of employment to collect statistics, and to examine provisions made for the health, safety and welfare of the employees therein; to enforce all the laws relating to the several departments under its control. It has power also to promote voluntary arbitration and conciliation between the employer and employed; to conduct free employment agencies; to license persons who desire to act as steam engineers, and operators of steam boilers, and to censor moving-picture films. With such power, which is almost unlimited, great and lasting benefits should result to the state of Ohio.

⁂

Don't let your fireman turn his fire upside down so that the ash is lifted to the top. Under those conditions the ash gets hot and melts and by the time it reaches the grates it will form clinker and slag. Boiler fires should be cleaned by the clock rather than by the appearance of the fire.—Bromley in "Power."

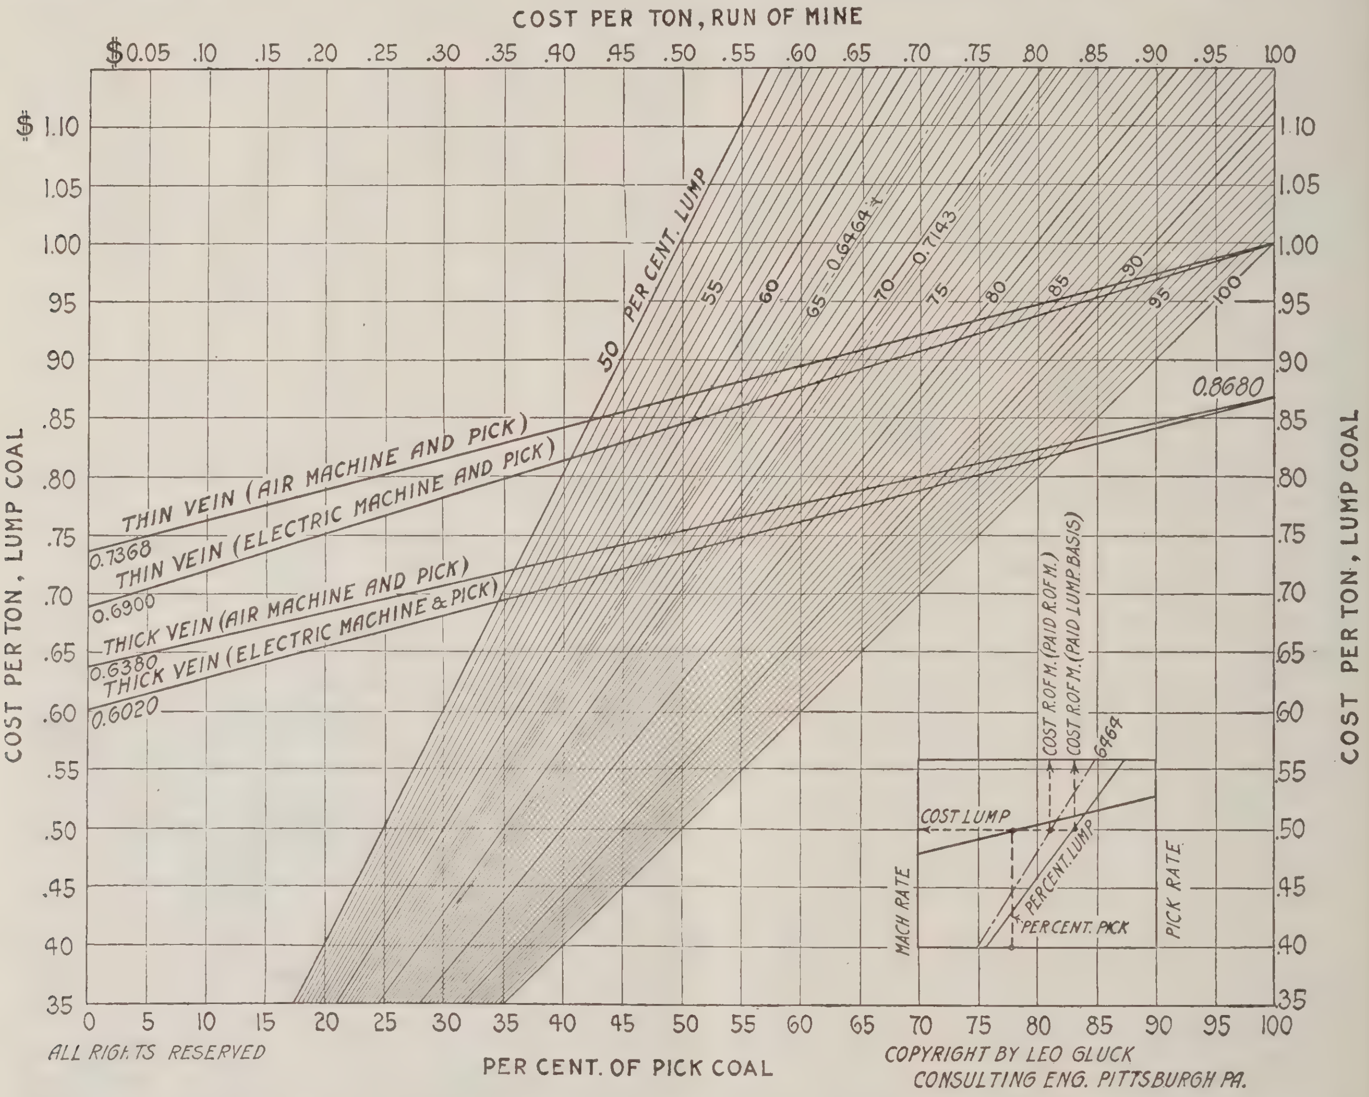
INCLINE AT A MINE OF THE CHATTANOOGA IRON & COAL CO., DUNLAP, TENN.

The Cost of Mining Coal

The accompanying chart showing the cost of lump and mine-run coal for all types of mining machines and mining rates will be found valuable for quick reference in many instances.

The chart, while primarily designed for the Pittsburgh district, can be used for any other machine or pick rate. If we mark a point on the left side of the chart, equivalent to the lump-machine rate, and then mark another point on the right side of the chart equivalent to the lump pick rate, a line may be drawn connecting the two points, and the chart becomes general.



General Chart Showing Cost of Lump and Mine-Run Coal for All Types of Machines and Mining Rates. The Chart Is Based on Rates for (1) Undercutting (2) Drilling by Hand, and (3) Loading in Rooms

To make it clear, let us assume the machine lump rate per ton as 69c.; the pick lump rate as $1. Then the line connecting these two points is marked (see diagram) "thin vein—electric machine and pick."

Now the basis for cost of mine-run coal (paid on the mine-run basis) for the Pittsburgh district, is shown by a dot and dash line as 64.64 per cent. lump. Calculations can be made for any other district by substituting another run-of-mine lump base line similar to the 64.64 line shown on the chart.

For example: Suppose the percentage of pick coal in the "thin vein" is 40 per cent. Then from the line marked 40, at the bottom of the chart, read up to the point where this line intersects the line marked "thin vein—electric machine and pick." We then read to the left and find the cost of lump coal is 81.4c. per ton. Again, from the point of intersection of the "percentage of pick-coal line" (40, with the "electric machine and pick line" read horizontally to intersect the line spoken of above, which shows the base percentage of lump in the mine-run coal. In this case, if this latter percentage is 64.64, we read over to this point of intersection, and then vertically up to the top of the chart, where we can read off the cost per ton of run-of-mine coal paid on the run-of-mine basis—in this case, the cost is about 52.5c. per ton.

For costs of run-of-mine (paid on the lump basis) assuming the run-of-mine to have 70 per cent. lump (30 per cent. screenings), from the point of intersection of the "percentage of pick-coal line" (40), with the "electric machine and pick line," read horizontally to the right to intersect the 70 per cent. lump line, then read vertically up to the top of the chart where we read off the cost per ton of run-of-mine coal (paid on the lump basis), which is for this example about 57c. per ton.

Storage-Battery Locomotives in a Developing Mine

The Nokomis Coal Co. is using a storage-battery locomotive in its new mine at Nokomis, Ill. The results this firm is obtaining are worthy of a passing glance, particularly at this time, when so much is being written relative to the efficiency of this type of haulage.

The storage-battery locomotive seems to be well suited to the needs of the new mine. It can be used in driving the main entry or haulageway until the roadway is extended a thousand or fifteen hundred feet, as no wires need be strung along the headings nor do the rails require bonding. Later on when the mine is developed the locomotive can be placed in a cross-entry or to gather from rooms, and "a no-mule mine" can thus be secured.

This is the system employed at Nokomis, which is one of the most uptodate mines in Illinois and bids fair to be one of the largest mines in the country. The coal is 8 ft. 4 in. thick and the shaft is located in the center of a 3000-acre tract of rich Montgomery County coal. The shaft was sunk in January, 1913, and today the mine is producing 2500 tons daily.

HAULS 1000 TONS AND COULD HAUL MORE

The cars have roller bearings, weigh two tons apiece and hold five tons of coal. The tracks are laid with 40-lb. rails and the roadways are kept in first-class condition. The six-ton storage-battery locomotive is hauling to the shaft bottom from the northwest main-line haulageway, a distance of 900 ft. with 500 ft. of 1½ per cent. grade against the load. It is also hauling from the southwest entry, also a distance of 900 ft. with a similar 500 ft. of 1½ per cent. grade against the load.

As above stated, the car and load weigh 7 tons and the locomotive is averaging about 200 cars in eight hours, which gives a tonnage of 1000 tons of coal hauled from these two entries by this single unit. This is equivalent to a gross tonnage of 1800 tons as the cars transporting the coal weigh 400 tons and make the trip both ways, once empty and once loaded. The motor has hauled as many as 212 cars in a day of eight hours. The average trip contains five to six cars, but to prove the capacity and ease with which this motor handled the work on the next to the last trip for the day, it was hitched to ten cars, or a combined trainload of 76 tons, including the weight of the motor itself.

SAVES WIRING ROOM ENTRIES AND YET DISPENSES WITH MULES

This machine will soon be placed at the actual work for which it was intended, that of gathering the coal from rooms and delivering the cars to the partings for main-line motors to collect. It will easily gather 200 to 225 cars a day. This demonstrates beyond a shadow of doubt that the storage-battery locomotive will take care of the early output of a new mine and later on it can be placed on room and cross-entry work. Thus it will do away with the mule entirely. It is also a flexible unit and can be taken out of one mine and placed in another with little trouble, wherever, of course, the gage is the same, as it requires no trolley wire or bonded rails.

The results the Nokomis Coal Co. has obtained with this method and the fact that it has now ordered two duplicate motors prove that where these machines are equipped with adequate batteries they will handle a large tonnage economically. This locomotive was manufactured by the Geo. D. Whitcomb Co., of Rochelle, Ill., and was especially designed for the work.

⁂

Two Christmas Days in Many Mining Camps

In many of our coal-mining towns, there will be celebrations of two Christmas days, and the same is true of New Year's Day. This is due to the fact that many of the miners are members of the Greek Catholic Church, which has never accepted the Gregorian calendar, by which time is measured by most of the civilized nations. The adherents of the Greek faith, which include Greeks, Russians and the people from the Balkan States, use the old style calendar, which is 13 days later than the one generally used.

A one-day celebration of Christmas is also beyond the conception of the average foreign-born miner, as many require a day or two to get ready, and often the same length of time to recover from the festivities. The Polish miner celebrates the 25th and 26th of December. Thus it is necessary to shut down the mines for at least four days for the first Christmas, and after the Christmas holidays are over the same miners have another holiday on January 1.

Where there are a number of Greek Catholics another period of idleness begins on January 7, and continues for several days, and New Year's day for these people occurs on January 14.

Coal mining presents many queer problems, and one of the queerest is the celebration of dozens of different holidays by the foreigners throughout the year. Often these celebrations, unannounced to the management, will draw away enough workers to seriously hamper the operation of the mines. The difficulty comes from the varying nationalities of the workmen, and each nationality or religious sect has its "holy days" and other occasions for celebration.

There seems to be no remedy for the situation, as an attempt to bring about any uniformity in the observance of these holidays would be like trying to get all the foreign-born miners to speak the same language.

⁂

Replacing Valves in Triplex Pumps

A short time ago, says C. H. Lloyd in *Power*, I saw a tool for holding in place the springs on a pump valve where the valve chests open at the side and there is no room to hold the spring down with one hand and start the nut with the other. I always press the spring together and tie it on each side; then it can be dropped in place and the nut put on without difficulty, after which the string is cut to release the spring.

⁂

When it is desirable to use compressed air for hoisting, the air can be stored in large receivers. The Anaconda Copper Mining Co. at Butte, Mont., has a number of these 10 ft. in diam., 30 ft. high, having a combined cubical capacity of about 70,000 cu.ft. and capable of retaining about 500,000 cu.ft. of free air, an amount which the compressors combined could not compress in half an hour. The air pressure is maintained constant by a back pressure of water which reduces the capacity of the receivers as the air is used.

The Coal Fields of Ohio

By J. S. Burrows*

SYNOPSIS—A description of the Ohio coal fields containing the best authenticated data there are on the subject. The geology and commercial importance of the different seams are carefully and accurately worked out. This is the second article along this general line, the first having covered the state of Pennsylvania.

The Ohio coal field embraces an area estimated at 12,600 square miles and lies entirely within the eastern half of the state. The field as a whole is a continuation of the Pennsylvania bituminous field to the eastward, and with it forms the northernmost part of the great Appalachian field, which extends southward from Ohio into West Virginia and Kentucky and thence through Tennessee as far as central Alabama.

The accompanying map of Ohio shows the coal areas and principal mining districts, the latter indicated by the numbered circles. The numbers refer to the table of mining districts which gives the particulars covering each district. The last column in the table of mining districts refers to the index column of the table of coal beds from which may be found the important coals of each district.

The table of coal beds is arranged geologically from the lowest known coal at the bottom of the table to the highest coal at the top. This table, which has been compiled from the best information available, is based on

MINING DISTRICTS—OHIO

Map No.	Name of District	Railroads	Kind of Coal	Principal Uses of Coal	Index Numbers Important Coal Beds
4	Cambridge	B. & O. R. R., Cleveland & Marietta Ry	Bituminous High Volatile	Steam, Railway and Domestic	4-7

The Coals of Ohio

Index No.	System	Series	FORMATIONS	NAMES OF COAL BEDS	NOS. OF COAL BEDS	LOCAL NAMES OF COAL BEDS	COMMERCIAL IMPORTANCE
1	(Upper) Carboniferous	Pennsylvanian	**Monongahela**	Waynesburg	8-b or 11	Macksburg	No commercial importance.
2				Sewickley	8-a or 10	Meigs Creek	Comparatively unimportant, coal with future value.
3				Redstone	9	Pomeroy	Mined in Gallia, Lawrence and Meigs Counties.
4				Pittsburg	8	Pittsburgh number eight	Third place in production. Will probably take first place in future. Occurs in southeastern part of the state and occupies the whole or a part of Belmont, Jefferson and Meigs counties, the most important productive areas, and Harrison, Guernsey and Athens counties.
5			**Conemaugh**	Crinoidal	7-b	Norwich and Patriot	Commercially unimportant.
6				Mahoning	7-a	Grof, Strip vein, and Brush Creek	Commercially unimportant.
7			**Allegheny**	Upper Freeport	7	No. 6 in Southern Columbiana County, No .7 in Stark County, and Southwestward, Black band coal in Stark and Tuscarawas counties, Big Vein of Salineville, Del Ray and Sherrodsville coal, Cambridge coal, Alexander coal of Muskingum County, Blue Rock coal of the Muskingum Valley, Bayley's Run and Norris coal of the Hocking Valley, Waterloo coal of Gallia County.	Second place in production, and extensively mined in Guernsey and Carroll counties and an important coal of the Sunday Creek district.
8				Lower Freeport	6-b	No. 5, No. 6-a in Stark County and Southwestward Whan coal of New Lisbon, Steubenville Shaft coal, Hamden Furnace coal of Vinton County, Hatcher coal of Lawrence County.	Thin and uncertain except in the Steubenville district along the Ohio River where it is mined to some extent.
9				Upper Kittanning	6-a	No local name	Absent or of no value.
10				Middle Kittanning	6	No. 4, Osnaburg coal of Stark County, Pike run and Dennison coal of Tuscarawas County Coshocton coal, Upper Zanesville coal, Upper New Lexington coal, Nelsonville and Straitsville coal, Great Vein of the Hocking Valley, Carbondale and Mineral City coal, Upper Zaleskie coal, Washington Furnace coal, and, Sheridan coal.	First place in production and extensively mined in Hocking, Perry, Tuscarawas, Athens, Coshocton, Carroll and Muskingum Counties. The coal known to the trade as "Hocking Valley coal" is taken from this bed.
11				Lower Kittanning	5	No. 3, No. 4, Leetonia, Creek Vein, Hammondsville, Potter's Vein, Clay Vein, Mineral Point coal, Lower New Lexington coal, and New Castle coal of Lawrence County.	Thin but persistent bed found in nearly every county in the coal fields of the state and the source of a considerable output in Tuscarawas County where it reaches its greatest thickness.
12				Upper Clarion		Limestone coal of Jackson and Vinton counties, No. 4 of Mahoning County, No. IV-a.	Commercially unimportant.
13				Lower Clarion		Limestone of Jackson and Vinton counties, No. 4 of Mahoning County, No. IV-a.	Commercially unimportant.
14				Brookville	4	Gray Limestone coal, Upper Limestone coal, Winter's coal of Vinton County, Flint Run coal, Conway coal of Lawrence County, No. 3-c.	Generally unimportant, coal mined to some extent in Vinton County.
15			**Pottsville**	Tionesta	3-b	Wartman coal, Bolivar coal of Stark and Tuscarawas counties.	Commercially unimportant.
16				Upper Mercer	3-a	No. 4, No. 3, Bruce coal of Mahoning County, Strawbridge cannel of Holmes County, Bedford cannel of Coshocton County, Newland coal of Vinson County.	Commercially unimportant, coal bed changing at some points into low grade cannel.
17				Lower Mercer	3	No. 2 of Mahoning County, Blue Limestone coal, Flint Ridge cannel.	Generally of little commercial value, but mined to some extent in Carroll and Mahoning counties.
18				Quakertown	2	Wellston coal, Jackson Hill coal.	Generally thin commercially unimportant coal bed, but most important coal of Jackson County where it has been extensively mined although the production of this area is gradually declining.
19				Sharon	1	Palmyra, Block coal of Mahoning Valley, Briar Hill coal, Massillon coal, Wadsworth coal, Jackson Shaft coal.	Formerly extensively mined beginning in 1828 but now nearly exhausted. Principal operations at present in Stark County.

the Pennsylvania nomenclature. As stated in the first paper of this series, covering Pennsylvania coals,* the official names of formations and coal beds adopted for the State of Pennsylvania, are considered the standards of reference for the coals of the Appalachian fields.

Originally the Ohio coals were designated numerically from No. 1, which is now correlated with the Sharon coal, consecutively up to No. 8, which is the Pittsburgh seam, there being considered but eight coal beds in all. Later discoveries, however, made it necessary to increase the series. This was accomplished by adding more numbers to coals higher than the Pittsburgh and by using a letter with the old numbers where the addition of an intermediate seam came within the old series of numbers. This system has caused some confusion in identifying the Ohio coals, which is greatly increased through the use of a large number of local names for the same bed, both within the same, and in different districts.

In the table of coal beds presented herewith, the correct, or Pennsylvania names, for the coal beds are given precedence, followed by the old Ohio system of numbers and then the numerous local names.

The coals of Ohio are entirely bituminous in character, that is, of the high-volatile type, and while they are mostly used for steaming, railway and domestic purposes, several of the seams yield coal suitable for special purposes, such as rolling-mill and blast-furnace work. Other seams yield coal which is widely known as a high-grade domestic fuel.

⁂

One soldier out of every four men—that is the measure of the response given by the miners of Northumberland and Durham to the call to arms. Over 40,000 of the 170,000 organized colliers in the two counties are in camp. The miner, as a rule, makes an excellent fighting man. He is not of imposing stature, but he is tough and fearless. The pit has no place for the weak or timid.—"New York Evening Post."

*"Geology and Location of the Coal Fields of Pennsylvania," Coal Age, Vol. 6, p. 459.

Durable and Fireproof Linings for Mine Shafts

Much has been written of late concerning the construction of durable and fireproof mine shafts. A further contribution to the existing literature upon this subject may not, however, be without value.

The problem involved divides itself into two phases, first the lining of a new shaft and second the protection of a shaft lining already in place and in use, so as to render it both durable and fireproof.

When a new shaft is to be sunk, the engineer may consider the nature of the strata to be penetrated, and then select from several excellent designs which have been tested in actual use the one which circumstances and financial limitations may prove to be the most satisfactory, all things considered.

Excellent designs of concrete linings for shafts were described in Coal Age for Nov. 7, 1914, and in *Colliery Engineer* for August, 1913.

The Allen & Garcia Co. of Chicago is at present engaged in lining a new shaft at Sesser, Ill., with premolded beams and slabs. The latter being cast complete at a factory in Indiana and shipped to the mine, to be lowered and secured in place in a manner quite similar to that employed in timbering. A description of a somewhat similar installation may be found in the *Engineering Record* of Oct. 31, 1914.

It is the purpose of this paper to describe a method of lining a shaft which may be applied to a new operation or adopted for the protection of one that may have been timbered and which it is desired to protect against fire, decay or corrosion.

"Gunite" is a trade name to denote the grout deposited by means of the cement gun. The mixture usually employed is composed of one part portland cement to three parts of sand. When this is "shot" by an air pressure of about 25 lb. per sq.in. by means of the cement gun, the product adheres tenaciously to the surface of application, regardless of whether this surface is masonry, wood or steel. It is quite dense, being about 23 per cent. heavier than 1 : 2 : 4 concrete, while tests have shown it to be impervious to water, nonabsorbent, and possessing a much higher tensile and compressive strength than ordinary high-grade concrete. A 2-in. layer of gunite is considered a safe fire and rust protection for steelwork in skyscraper construction, when subjected to a temperature of 1700 deg. F. for four hours. A 1½-in. layer will protect steel buntons or mine sets against corrosion indefinitely, or it will protect wood or steel from any mine fire which may occur.

A Common Practice

A practice not infrequently followed in coal mining is to line the shaft with solid concrete down to the rock, from which point onward an ordinary thin lining of wood is employed. On the other hand, the same shaft might be lined with wood throughout its entire depth, the sizes of the timber depending upon the depth of the shaft and the pressure encountered. A 2-in. layer of reinforced gunite would fully protect this wood from fire and seal off all water and air, making a shaft at once dry and fireproof. The water-logged timber behind the gunite lining would never be subjected to the action of the air and would consequently never decay or require repair.

In the case of a new shaft with new timbers, the gunite protection insures durability as well as fireproofness. Since decay in wood requires the presence of moisture, warmth and air, the exclusion of the latter renders these timbers proof against deterioration. There is the further advantage that sinking may be pursued in the usual manner, and the gunite applied on the night shift after the shaft is completed and while it is in operation during the day. This grout lining is also an extremely efficient means of sealing off the airway in the shaft from the hoisting and manway compartments. In an old shaft, on the other hand, if decay has not already made damaging progress, the shaft may be fireproofed and secured against further deterioration by this method.

There are many instances, also, where a timber lining may be omitted entirely through the rock strata. This is accomplished by sinking and trimming close to the required dimensions and then sealing up the interstices of the rock with gunite applied before the mineral has had opportunity to disintegrate. In this case the grout is shot into every crack and crevice, not only covering the surface, but cementing adjacent strata together.

In some mines it is necessary to use heavy sets either of wood or steel, with lagging on the outside. In this case, the entire inner surface may be protected by reinforced gunite. This method was employed in lining the Cary shaft of the Odanah Iron Co., at Hurley, Wis., a description of which may be found in *Black Diamond* of Oct. 31, 1914. In this case the three-compartment shaft was lined with 3-in. wood plank, carried by I-beam sets. Lagging and beams were then covered with 2 in. of reinforced gunite. The shaft was originally so wet that the sinkers were obliged to work in oilskins. The portion which was lined as above described is now, however, perfectly dry.

The extent to which the various methods of shaft lining are to be employed will depend largely upon the cost of the material necessary. The method of sinking and lining with timbers, as heretofore followed, will doubtless be continued largely in the future, and in general it is believed that when permanency is considered, the method of timber lining and protecting this lining with gunite will be found least expensive. The great advantage claimed for this process is that it can be applied at a relatively small cost to shafts either old or new without seriously interfering with the operation of the mine.

Coal Mining in the Transvaal

By H. F. Mariotte*

The following are the coal outputs and prices per ton in the Transvaal, Union of South Africa, since 1910:

COAL OUTPUT OF TRANSVAAL

		Gross Receipts			
		Totals		per Ton	
	Tons Sold				
1910	3,970,000	£986,200	$4,802,794	5.0s.	$1.21
1911	4,344,000	1,021,000	4,972,270	4.7	1.11
1912	4,752,000	1,045,000	5,089,150	4.4	1.05
1913	5,225,000	1,143,000	5,566,410	4.3	1.03
1914 (estimated)	5,266,885	1,180,526	5,749,162	4.5	1.07

The output and value of the coal produced again increased in 1914. There are coal-bearing areas in the province still untouched, and it is not unlikely that, owing to the increased demand for coal caused by the war, efforts will soon be made to develop these resources.

*Mining engineer, Central Mining & Investment Corporation, 1 London Wall Bldg., London, E. C., Eng.

The Labor Situation

SYNOPSIS—A conciliation committee is appointed to restore industrial peace in the Ohio coal fields now on strike. The operators move to run "open shop" mines. In Colorado, the U. S. troops being removed, the militia has to be called in to replace them, though, so far, this service is local. The union in Illinois obstinately demands a favorable decision while admitting that it is in the wrong.

The statement of President Dwight P. Cary, of the Lorain Coal & Dock Co., most adequately describes the strike situation in the eastern Ohio field:

> During the ten months in which the miners have been on strike in eastern Ohio, they have been treated by the operators with every fair and reasonable consideration. They have been permitted to occupy their houses without molestation, and no attempt has been made to operate the mines, either with former employees or nonunion labor. There has been no war against the miner's union. At all times since the so called mine-run law became effective in Ohio, the eastern Ohio operators have been willing and have offered to negotiate a contract on the mine-run basis. The only matter in question has been the price and any statement made to the contrary is absolutely false and misleading to the miners and the public.
>
> All contracts in Ohio, Indiana and Illinois and in the Pittsburgh district of Pennsylvania, the area comprising the central competitive field, have been made under the conditions formulated in the report of the miners' policy committee, which provided that all contracts should be made at the price prevailing in the last agreement or its equivalent. The miners' organization has signed contracts with the operators of Illinois and Indiana and of the Pittsburgh district of Pennsylvania providing the same wage scale as prevailed in the preceding agreement.
>
> It also made a contract with the operators of the Hocking Valley district of Ohio in which the scale is approximately 3c. per ton less than the scale prevailing under the last agreement. Nevertheless it has demanded that the operators of eastern Ohio pay an increase of approximately five per cent. above the price prevailing in the last contract.
>
> The strike of the last ten months has given our business to the operators of other states and districts, and an increase in our price would enable them to retain it. This is the reason why we have opposed the increase. Just why the miners' organization should hold their eastern Ohio miners on strike for ten months, demanding a scale that is a decided increase over our last contract price, and over that given to competing operators, thus playing directly into the hands of our competitors, is something that we fail to understand.

The Pursglove-Maher Coal Co. states that its eviction order which was effective Jan. 15 has been held up pending the result of the federal investigation of the strike situation. This statement was made after it was definitely decided that the U. S. Department of Labor would take a hand in the settlement.

A Conciliation Committee Appointed.

To this end the Department on Jan. 5 appointed Hywell Davies, one of its representatives, one of the two unsuccessful conciliators in the Colorado dispute, and Daniel J. Keefe, formerly Commissioner-General of Immigration, Dec. 1, 1908 to May 31, 1913. In 1882 the latter was president of the Lumber Unloaders' Association and since 1893, except during an interval of two years, has been president of the International Longshoremen, Marine & Transport Workers' Association. He was an original member of the National Civic Federation and was at one time sixth vice-president of the American Federation of Labor and was a member of the Industrial Peace Commission in 1906.

On Thursday, Jan. 7, Hywell Davies arrived in Cleveland, Ohio, and conferred with President W. R. Woodford of the Pittsburgh Vein Operators' Association. On the same day Daniel J. Keefe discussed the situation with President T. P. White, Vice-President Frank J. Hayes and Secretary-Treasurer William Green, of the United Mine Workers of America. This meeting occurred at Indianapolis, Ind. On the following day the conciliators met at Cincinnati, Ohio.

Desire Conciliation if Conciliators will Concede Claims

A meeting of conciliators, operators and miners was arranged for last Wednesday, Jan. 13, but we have no advices as to its outcome. Thomas Haggerty, C. J. Albasin and Thomas Cairns have all declared themselves as not unfavorable to the investigation. C. J. Albasin, the local president, however, in writing to W. B. Francis, of the House of Representatives at Washington, while thanking him for his action toward the appointment of conciliators, declares his firm intention not to be conciliated unless his demands are granted in full. T. K. Maher, of the Pursglove-Maher Coal Co., said the operators welcomed the federal investigation and had no fear of the result.

"Open Shop" Operation to Be Attempted

On Jan. 7 the eastern Ohio operators, after a three-day conference, announced that they would open their mines on the "open shop" basis. The operators voted unanimously for that policy and it is expected that efforts will be made to start the mines in Belmont, Harrison and Jefferson Counties. At several mines instructions were given that the miners were to be informed of the intention to start the mines and that those desiring work must apply individually. Preference is to be given the old employees in every case. Failure to obtain a sufficient number of union men will result in the bringing in of other men from outside of the district.

A special committee, comprising W. R. Woodford, Michael Gallagher, H. E. Willard, Joseph Pursglove, S. H. Robbins, of Cleveland, George M. Jones, of Toledo, and Judge R. L. Wildermuth, of Columbus, was appointed to direct the reopening of the mines and to remain in Wheeling, W. Va., to watch developments until they were again working. Only one mine will be opened by each company at this time.

It was reported on Saturday that the Somers-Roby Coal Co. had 50 men at work in a mine in Belmont County and on Monday had 60. This is one of the properties opened under the open-shop system.

Moving Out of Ohio

It is said that the Lorain Coal & Dock Co. will close all their Ohio mines except the Crescent and will supply their trade from a new mine in Logan County, W. Va., the work of erecting the tipple progressing rapidly. Samuel and James Pursglove, large stockholders in the Pursglove-Maher Coal Co., are preparing to let contracts for a new tipple in Logan County, W. Va. The Troll Mining Co., of St. Clairsville, Ohio, purposes to close its mines indefinitely. No matter what the outcome of the strike may be, operating in Ohio will not be attractive and the first two companies will probably endeavor to get all their coal in West Virginia.

Miners in Illinois Declare Themselves Not Guilty But Will Pay the Bill

A serious break between the United Mine Workers and the Illinois Operators' Association threatens as the result of a dispute over the wages at the mine of the Berry Coal Co. at Spring Valley. The miners have been on strike for several weeks, and the operators insisted that the strike be called off.

The United Mine Workers' officials contend that their miners are in the right, but have agreed to reimburse the coal company the amount of money in dispute if it will acknowledge the claim. As a matter of principle, the operators will not concede this, and have served notice that they will have no further dealings with the miners' organization until the Berry strike is settled. The U. M. W. of A. are trying, according to rumor, to have the Central Illinois Coal Operators' Association and the 5th and 9th District Association agree not to support the Illinois Operators' Association, thus bringing about a disagreement that is likely to cause much confusion and trouble in the Illinois field.

Union Desires to Buy Mines

The United Mine Workers of America has offered $200,000 for the holdings of the Bache-Denman Coal Co. in the Hartford Valley, Arkansas. The transfer is to be conditioned on the quashing of all actions growing out of the troubles between the coal company and the miners, including a suit for $1,450,000 brought by the company to recover for the burning of their tipples and houses.

Militia Called Out In Colorado

The U. S. troops being entirely withdrawn from Colorado, on Jan. 9, Sheriff Jeff Farr, of Walsenburg, concluded he could not protect the jail at that place in which 15 strikers were incarcerated charged with murder, conspiracy, and other crimes, in the mine battles of last spring. Samuel DeJohn, one of the alleged participants in the La Veta ambuscade, is reported to have turned state's evidence, and as he is imprisoned in the same jail, there might have been not only a jail delivery but a lynching. He is the only man who took part in the La Veta attack who has not been taken to Pueblo. A company of 70 militiamen was furnished by Governor Ammons, and two more are ready to assist in case of an emergency.

Editorials

Coal Beds and Their Characteristics

Recent correspondence and even some technical reading have convinced us that the public and some mining men have a hazy idea of the relative unimportance of determining the particular bed from which a coal supply is derived. Of course, it is well known that in *any particular locality,* one bed is clean, another not so clean and perhaps a third is relatively dirty and a fourth may not be workable. Then, also, of course, thickness varies most markedly.

Nevertheless it is also true that as far as freedom from bone, slate and sulphur is concerned, any one bed of coal will vary immensely over large areas. In the bituminous regions of Pennsylvania, for instance, the best coal in eastern Clearfield was the Moshannon or Lower Freeport, in Indiana it is the Miller or Lower Kittanning, in parts of Cambria, the Upper Kittanning. In many places where the Miller is good, the Lower Freeport is worthless, and where the latter is good, the Miller bed can be placed on the market only with difficulty.

We know that a host of people will immediately, on reading this, defend the Miller bed as being everywhere a low-volatile coal of great calorific power. As a matter of fact, where that bed does not have the qualities mentioned, it is not called the Miller bed, but the Lower Kittanning. The low volatility is not a quality of the bed but an attribute of location which it shares with all the other beds in the same locality.

The Miller bed today is being sold as Moshannon coal in Clearfield County, Pennsylvania, because the Lower Freeport, which rightly bears the name "Moshannon," has been almost entirely worked out. The purchaser is really not deceived. He desires a low-volatile coal and he gets it, even though the fuel may come from the Clarion or the Lower Kittanning seam. If he should secure the real Moshannon he will probably find it a badly weathered coal, as most of it now comes from formerly abandoned outcroppings.

To show how largely volatile content varies in the same bed, we will quote these analyses from the report of the U. S. Bureau of Mines, the United States and Maryland Geological Surveys and the Second Geological Survey of Pennsylvania.

TABLE CONTRASTING IDENTICAL BEDS IN PARTS OF PENNSYLVANIA

	Moisture	Volatile Matter	Fixed Carbon	Ash
Lower Kittanning—				
Windber mine, Somerset Co.	3.2	12.5	80.6	3.7
Pulaski Township, Beaver Co.	2.2	40.9	49.5	7.4
Upper Kittanning—				
Windber, Somerset Co.	3.0	12.0	77.4	7.6
New Salem, Armstrong Co.	1.2	37.9	52.8	8.1
Lower Freeport—				
Stony Creek, Cambria Co.	4.7	13.8	72.3	9.2
Center Hill, Armstrong Co.	1.0	40.2	47.4	11.4
Upper Freeport—				
Conemaugh, Cambria Co.	2.6	14.9	72.4	10.1
Shippingport, Beaver Co.	1.5	41.4	49.8	7.3
Pittsburgh—				
Eckhart, Allegany Co., Md.	0.7	17.6	75.9	5.8
Bruceton, Allegheny Co.	2.9	36.2	55.1	5.8

It will be seen that the range of values for volatile content is not quite as great in the Upper Kittanning and Pittsburgh beds as in the others. That difference solely arises from the fact that we have taken Armstrong and Allegheny County values in those instances and the coals in those counties are not nearly so high in volatile matter as those in Beaver. As the percentages of volatile matter are about equal in any given boring, it is likely that if we had analyses of Upper Kittanning or Pittsburgh coal near Shippingport, Beaver County, we would find those fuels would have over 40 per cent. of volatile matter, and if we could find Upper Freeport coal at Windber and obtain an analysis, it would probably not be far from 12.0, which is the value for the Upper Kittanning at that point.

It will be noted that one analysis is from Maryland. It is so taken because the figures for volatile matter in that state rule low. Pittsburgh coal is nowhere found in Pennsylvania so near the great uplift, but even in the Salisbury basin of that state that bed is found to contain only 19.61 per cent. of volatile matter, which is much less than the 36.2 at Bruceton.

It is well to add that the excellent analyses in the books published by the Bureau of Mines under the title "Analyses of Coals," as Bulletins 22 and 85, especially the latter, are not by any means complete. It is only just to add that the authors of the bulletins make no claims for completeness except to say they completely cover the tests of the Bureau between July 1, 1904, and June 30, 1913.

Thus in Pennsylvania only 19 counties are partly covered, whereas in all 37 are coal producers. In the State of Ohio the analyses of the coal in only 10 counties are given, whereas 28 counties are reported as coal-producing in E. W. Parker's report. Erroneous ideas can easily be formed by assuming the lists given to be representative of American coals rather than typical of fuels offered to the United States Government for test or purchase.

To state the purport of this editorial in another way: Fuels from different beds in the same districts of Pennsylvania more closely resemble each other than coals from one and the same bed in different parts of the state. Superincumbent and subjacent coals are usually much alike in texture, coking qualities and volatility, whereas coals of the same bed in different counties may not even serve the same industrial purposes, so utterly unlike are they.

⁂

The Year of the Great War

We do not know which year will best fit the title of this article. Perhaps there may be several years of the Great War before the struggle is completed, but let us never lose heart. When we compare the cost of the strife with the stock of gold and the holdings of corporations, we are horrified by the immensity of the expenditures, but nations are bigger than their hoardings and stronger financially than their joint-stock companies, and the inefficiencies and wastes of the people are so great that, if these are only surrendered, the champion waste of all wastes, war, can be allowed to continue for years without exhaustion.

Let us be careful of the excessive use of superlatives. It is true the war may be Armageddon, but it does not spell annihilation. Let it not be forgotten that the annual governmental expenditures of the Allies, omitting those of Japan and Portugal from the list, as these countries are really not in the war, amount to the colossal sum of \$5,093,006,000. Similarly the annual government outgo of Germany, Austria-Hungary and Turkey amounts to no less than \$3,704,527,000. It is easy to see, therefore, that the nations involved have so far not borrowed much more money than would run the governments for a year in peace.

It is interesting to note that the world's governments spend in the piping times of peace \$12,626,938,000. These figures obtained from the *World Almanac* show that a large draft on resources can be made, and the world's pockets will meet the strain without disaster.

The wealth of the world is largely of comparatively recent growth. Yet the property of the principals on the side of the Allies foots 184 billions. On the other hand, that of Germany and Austria-Hungary alone is 105 billions. All this takes no count of colonies and minor contestants as Turkey, Servia and Montenegro. If their property is proportional to their annual expenditures, the Allies must have a wealth of 243 billion, and the Teutonic league, resources of 110 billion dollars.

If America would try and forget the struggle, which is not the only source of her misfortunes, and would steadily have faith in herself and a little more consideration for her capitalists, she would experience unfettered prosperity.

Her financial isolation, though so generally deplored, has placed her where the surges of foreign tides can do her no harm.

The Illegitimate Dealer

Out in Indianapolis, a large furniture installment house, for the second time, has entered into the retail coal trade for the winter season. Such cases are not new to the coal business, instances of this kind being on record in many parts of the country. They are none the less a source of irritation, and frequently create bitterness on the part of the strictly legitimate dealers. However, efforts of this kind have seldom ever attained to serious proportions, for it is obviously illogical that a business venture of this character, dependent for success upon the destruction of another business, can long prevail.

So far the scheme has not extended to large proportions, and it is understood that the quality of the coal handled is in keeping with the prices at which it is offered. Under ordinary conditions the dealers' organization would, of course, take immediate steps to compel the operator furnishing coal for such an enterprise to withdraw from the business. But the company supplying this coal seems to have no regular dealer trade.

A Brighter Outlook in the Middle West

Indiana and Illinois coal producers are devoting considerable time and thought to the uniform sizing of coals, and are getting closer together than ever before on the matter of prices and the question of regulating production. While these remedies are not a panacea for all ills, their majority adoption will have a far-reaching effect toward betterment of the coal trade in the Central West. The agitation for concerted effort in these directions is causing many to feel that better conditions will prevail next season, which tends to make the mine operator feel more hopeful.

Producers generally feel that higher prices will be received in the early months of this year than in previous years, and express confidence that benefits will accrue from the movements now afoot to afford the coal man an opportunity to receive his share of the rising prices generally connected with the cost of living. The mine owners of the Central West probably receive a smaller return on their investment than any other kind of industry, and this unfavorable condition will be largely overcome by price agreements, restricted production and uniform methods of preparing coal.

Who Gets the Promotion?

It has been impossible to handle all the replies to the Cartoon Problem, "Who Gets the Promotion?" in time for this week's issue of Coal Age. An earnest effort was made to get the matter in final shape, but the task was too great for the time available. Several days have been required simply to read and classify the answers, for no question ever advanced by Coal Age has attracted such widespread interest and elicited so many replies.

Out of the great number of answers sent to us, 102 have been selected by the judges as worthy of consideration. It would require a special edition of our paper to print even this number; so it has been decided to abstract and condense the majority of the answers, only publishing in full the replies selected by the judges as having the greatest merit.

One thing has been shown clearly by the answers received—no single one of the three men up for promotion has all the worth-while arguments or sympathy on his side. High coal-mining officials with thousands of men under them differ wholly in their opinions and choice. Everybody admits the value of a pleasing personality, as indicated by one of the applicants who is popular with his associates. Everyone also condemns being grouchy, although one of the most important mine presidents in the country selects the "grouch" for advancement because of his otherwise excellent qualities.

It is seldom that a question comes so close home to everyone generally as the problem advanced in the cartoon we published. We are all hoping for promotion, and we all realize that certain of our personal traits will be weighed by the boss when he makes his selection of a man for advancement. Consequently, it is likely that Coal Age readers will be afforded an opportunity to reflect on the matter of their own personal assets, in the way of individual characteristics, when the letters on the "promotion problem" are published next week. It is just possible that some of the answers may help us understand why the other fellow was promoted and we were not.

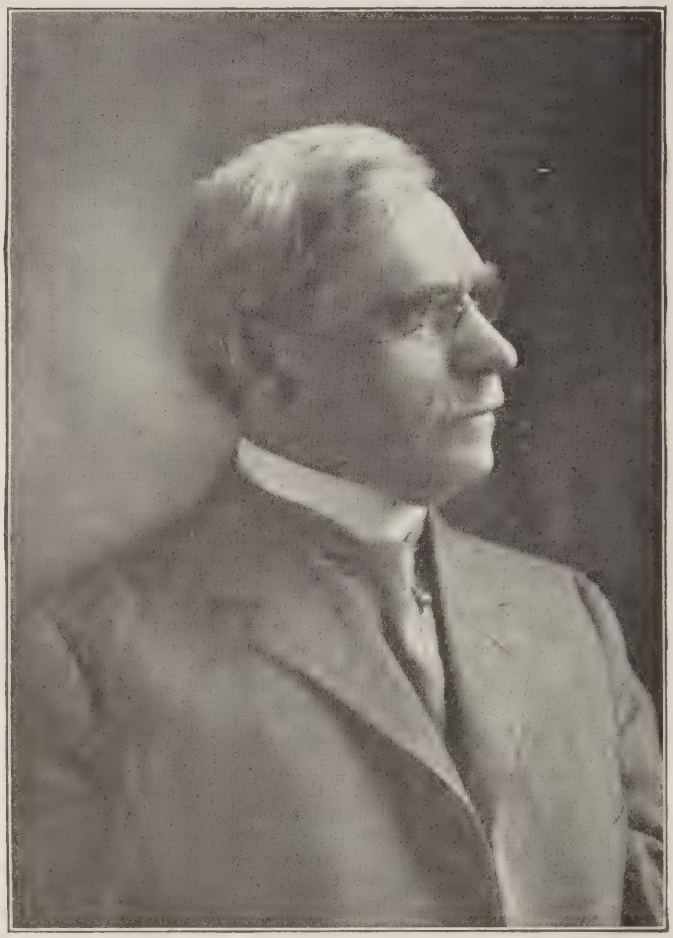
Coal Age Indexes Now Ready

Indexes to Coal Age are furnished free to all who ask for them. The index for the last half of 1914 can now be obtained by addressing a request for one to the Subscription Department, Coal Age, New York City.

Thomas Lynch

On Jan. 1, from the Church of the Most Holy Sacrament, in Greensburg, Penn., occurred the funeral of Thomas Lynch, for many years president of the H. C. Frick Coke Co., as well as many other industrial firms. Death occurred from exhaustion following an operation for septic peritonitis.

Of all men who have ever materially influenced the coal-producing and coke-making industry of the land, few, if any, have possessed greater power and at the same time have been more self-effacing. Born of Irish parentage in Uniontown, on Aug. 13, 1854, Mr. Lynch attended the common schools until he was 17 years of age. He then started his business career as a clerk in a store. In 1875 he began clerking in the Frick company's store at Broad Ford. In 1877, the H. C. Frick Coke Co., then owning 200 coke ovens and about 150 acres of coal, began to expand beyond the confines of the Morgan Valley, leasing what was then known as the Valley Works from Willson, Boyle & Playford. Mr. Frick selected the ambitious clerk in his Broad Ford store to take charge of the new operation, making Thomas Lynch superintendent and store manager. He was also given charge of the Anchor and Ferguson Works, at Dunbar, in 1878, when these were acquired by the H. C. Frick Coke Co.



Thomas Lynch

In 1882, Mr. Lynch was named general superintendent of the H. C. Frick Coke Co., becoming at that time the virtual operating head of the firm. From this time on the Frick company began its phenomenal growth. With H. C. Frick as the executive head of the corporation, and Thomas Lynch as his assistant and chief of the operating department, the company soon dominated the coke trade, which position it has never lost.

In 1890, Mr. Lynch was given the title of general manager, retaining the same until about 1896, in which year H. C. Frick retired as president, Thomas Lynch being elected to succeed him. It was during this period that Mr. Lynch issued his famous Safety-First order.

As president of the firm, Mr. Lynch was by no means a figurehead; he maintained the same close touch with operating conditions which marked his career as general superintendent and general manager, and was admittedly the controlling spirit of the H. C. Frick Coke Co. At the time of his death he was not only president of that company, but was at the head of the coal-mining operations of the United States Steel Corporation. He was president of the United States Coal & Coke Co., of West Virginia; the Bunsen Coal Co., of Illinois; the National Mining Co.; the Sharon Coal & Limestone Co., the Republic Coke Co., and the Hostetter-Connellsville Coke Co., all of Pennsylvania.

On Dec. 16, 1879, Mr. Lynch was married to Miss Sarah Agnes McKenna, of Pittsburgh. At that time he made his home at Dunbar, moving to Greensburg about 1890. He is survived by a widow and the following children: Mrs. Joseph B. Wentling, Miss Sarah A. Lynch, Thomas Lynch, Jr., Ralph Lynch, Clay F. Lynch, and Charles McKenna Lynch, all of whom reside in Greensburg, except Clay Lynch, who is general manager of the Bunsen Coal Co., at Danville, Ill.

Throughout his entire career, Mr. Lynch has been the friend of the workingman and the ardent advocate of safety. In the welfare work among miners, in which the H. C. Frick Coke Co. has admittedly taken the lead, he was strongly interested. He was a firm believer that attractive homes made contented workers and not only encouraged annual garden contests, but strongly supported large appropriations for sanitary improvements in and about the various mining plants under his charge and for safety appliances at the mines and instruction among the employees.

⁂

Largest Class of First-Aid Workers

The largest class of mine-rescue and first-aid workers yet trained in the West Virginia coal fields has just completed a successful course at Gary, in McDowell County, and 86 miners have been thoroughly trained for the work at that place by the crew of the United States Mine Rescue car No. 8, which has been in the Pocahontas field for the past two months. In addition to this number, six young men from the Gary High School were also given complete first-aid training.

The hearty and efficient coöperation of the officials of the U. S. Coal & Coke Co., at Gary, made possible the organization of such an unusually large class in this important work, and the enthusiasm manifested by every employee of the company indicates that the efforts of the U. S. Bureau of Mines in this training work will be of a permanent nature.

A large number of classes in the Pocahontas field have been trained by the crew of this car, and at each place enthusiasm and interest have been displayed by both mine officials and employees.

Legal Department

Aspects of F. O. B. Sales Contracts

By A. L. H. Street*

One of the latest and leading court decisions affecting agreements for sale of coal, f.o.b. the seller's mines, is that announced by the Texas Court of Civic Appeals, in the case of Richard Cocke & Co. vs. Big Muddy Coal & Iron Co., 155 Southwestern Reporter, 1019.

The opinion, recognizing the well established principle that delivery of coal to a railroad company at a mine under a contract of sale, f.o.b. mines, constitutes a delivery to the buyer, holds that in a suit by the seller under such a contract, to recover the purchase price, the buyer is not entitled to show that he did not receive any of the coal shipped. The court says: "The proffered testimony of Cocke that he did not get a lump of coal in Houston shipped by the Big Muddy Coal & Iron Co. was properly excluded, because the question was, did the coal company deliver on board the cars at the mine and the fact that only so much coal reached Houston would not tend to prove that it was not put on the cars."

According to the Texas decision, the best evidence of the quantity of coal delivered to the buyer was the record of the mine weights.

The Buyer May Reject a Coal Shipment if the Quality Is Not as Specified in Contract

Again, the Court of Civic Appeals holds that when a buyer of coal inspects that tendered for delivery and finds that it is not what the contract calls for as to quality, he is at liberty to refuse to receive it, and is entitled to sue for such damages as he has suffered in consequence of the seller's breach of agreement to furnish fuel of a better quality. But the buyer must either receive or reject the entire shipment.

The last report of the Texas opinion takes up the question as to how damages for breach of a contract to deliver coal of a certain grade are to be measured. On this point the court decides:

"Ordinarily, if a contract for the sale of personalty, unperformed on the part of the seller, is broken by him, the measure of damages is the market price of such property, less the contract price, and the market price for this purpose must be determined as to the time and place of the delivery agreed upon.

It is ruled, however, that if at the time the contract is made, the seller has notice or knowledge that the goods are being purchased for sale in a particular market, or to be supplied in pursuance of a particular contract, he may fairly and reasonably be deemed to have made the contract in contemplation of that purpose, and to have assumed the risks thereby entailed; then, if he breaks his contract, damages for loss caused thereby, if not uncertain and remote, may be recovered."

---

*Attorney at law, St. Paul, Minn.

Recent Judicial Decisions

Duty of Operator to Miners—The duty which an operator of a mine must exercise to promote the safety of his employees is commensurate with the danger to them. (Oklahoma Supreme Court; Davis vs. Rock Island Mining Co.; 144 Pacific Reporter, 600.)

Interpretation of Leases—When the terms of a coal lease appear to be ambiguous, but the parties by their conduct have placed a practical construction on the doubtful provisions, the courts will enforce the lease according to that construction. (United States Circuit Court of Appeals, Fourth Circuit; Prudence Coal Co. vs. Perkins; 217 Federal Reporter, 569.)

Seller's Right to Rescind Contract—Under an agreement for a sale of coal deliverable in installments and providing for monthly settlements by the buyer on the 10th of each month, and authorizing rescission of the contract as to further deliveries on his failure to make payments on that date, the seller acted within its rights in cancelling the contract where remittance due in the seller's hands on the 10th was not mailed until the 11th. (Kentucky Court of Appeals, Southern Coal & Coke Co. vs. Bowling Green Coal Co., 170 Southwestern Reporter, 1185.)

"Chokedamp" and "Firedamp" Defined—Prooof of Negligence—Carbonic acid is commonly known in mining operations as "chokedamp," because of its extinguishment of flame and animal life. "Firedamp" consists of light carbureted hydrogen, and is so called because of its tendency to explode when mixed with atmospheric air and brought into contact with flame. In a suit to recover damages for death of a miner resulting from inhaling deadly vapors, the burden is on plaintiff to show that it was caused by some negligent act on the operator's part. (West Virginia Supreme Court of Appeals; Well's Administrator vs. Sutherland Coal & Coke Co., 83 Southeastern Reporter, 385.)

Contributory Negligence of Tipple Boss—A tipple boss, in moving a car to the tipple, discovered the presence of a timber too close to the track, jumped from the car to remove the timber, and in attempting to re-board the moving car was crushed between the car and a tipple post, and was fatally injured. He was in charge of the particular place and had the duty of inspecting the surroundings to determine their safety for himself and the other employees of the operator, and was therefore chargeable with knowledge of the proximity of the post to the track. Further, it appeared that he could have safely re-boarded the car by waiting until it had proceeded a little farther. Held, that he was guilty of contributory negligence, barring any right of recovery for his death. (Kentucky Court of Appeals; Louisa Coal Co. vs. Hammond's Administratrix; 169 Southwestern Reporter, 709.)

Liability for Injury to Children—The principles of law which render one liable for injury to a child of tender years, caused by a dangerous condition which is attractive to such children, where no attempt is made to guard against such accidents, cannot be applied to a case where a coal company permitted a lot of empty coal cars weighing 1000 lb. each to remain on a level track, several boys more than 15 years old rerailed a car which afforded an obstruction to movement of the other cars down a nearby grade, and in their running the cars a child ten years old was killed. "Here the coal company was not negligent, because there is no evidence here that these coal cars had ever been attempted to be operated by children of tender years, or that it was likely they could have been operated by them. But that is not all of this case: The coal company knew and recognized the fact that these cars were being thus operated, or might be so operated, and took precaution to prevent it, and had derailed a car at the connecting point of the side track on which they were standing with the main track. * * * If that car had been allowed to stay there, nobody could have operated those cars, and it could not have been moved by children of tender years—it could only have been moved by large boys or men." (United States District Court, Eastern District of Kentucky; Barnhill's Administrator vs. Mt. Morgan Coal Co., 215 Federal Reporter 608.)

Sociological Department

First-Aid Contest at Gillespie, Ill.

SYNOPSIS—A thoroughly democratic first-aid meet, which miners and operators together financed and conducted. Some youths also gave an exhibition of their skill. The discount or demerit list shows further improvements, the result, doubtless, of matured consideration.

The third annual meet, under the united auspices of the American Mine Safety Association, Local Union No. 730 of Mine No. 1, and the Superior Coal Co., was held Dec. 8 at the Colonial Theater, Gillespie, Ill. Nine teams contested in the full-team event, 18 teams in the two-man and 38 men in the individual event.

Winners of First Place, Full-Team Event, No. 3 Team, Gillespie First-Aid Association

From left to right: John Aitken, Fullerton Fulton, Sr., captain; Fullerton Fulton, Jr., James Fulton. S. Trainer, the patient, is not present.

SUPERIOR COAL CO.
MINE RESCUE STATION.

James Boston and His Boys' First-Aid Team, the Members of Which Received State Diplomas

From right to left: Richard Harris, captain; Philip Shanahan, John Shanahan, James Bergen, Willie Carroll, Bartlett Carroll.

The judges were Dr. August F. Knoefel, president of the American Mine Safety Association, Terre Haute, Ind.; Dr. C. W. Hopkins, chief surgeon for the Chicago & Northwestern R.R., Chicago, Ill., and Dr. H. C. Blankmeyer, local president of the American Red Cross, Springfield, Ill. The recorders were F. F. Jorgensen, chief engineer for the Superior Coal Co., and H. D. Easton, instructor in the Illinois Miners' and Mechanics' Institutes. The managing committee consisted of J. Boston, chairman; J. R. Greer, secretary; J. Clarkson, C. Miller and J. Struthers.

John P. Reese, general manager of the Superior Coal Co., called the house to order at 9.30 and announced J. Boston as chairman of the day. After a short address of welcome by Mayor Rice, the individual contest started. Owing to the large number of entries and the consequent necessity of working in groups of six, this event occupied all the forenoon.

ONE-MAN EVENT

Only five minutes' time was allowed for the one-man event, which was as follows: Subject is supposed to be lying down and engaged in undercutting with a pick when he is caught by a fall of coal and has the right side of the scalp lacerated, the right ear torn off and the right jaw broken.

Few of the men were able to perform this test within the specified time. The rules of the contest allowed each man one minute in which to read the slip which stated the injuries, and then the slips were taken from the men and the word "Go" was given.

This contest resulted in four ties that were worked off immediately after dinner. The problem given for the tie was a dislocation of the right shoulder. Eight minutes' time was allowed, which was about twice as long as any of the men needed.

The winners and the prizes awarded for the individual contest were as follows: (1) Trophy cup, American Mine Safety Association medal, American Red Cross medal and $5 cash, won by J. Vrabel, Breese, Ill.; (2) Gold medal and $5 cash, won by W. B. Griffiths, Cuba, Ill.; (3) Silver medal and $2.50 cash, won by J. Struthers, Gillespie, Ill.

There were in all 18 prizes, consisting of cash and articles of utility.

TWO-MAN EVENT

Eight minutes' time was allowed for the two-man event, the following problem being offered: "While three men were engaged in taking down slate, one of them was caught and sustained a compound fracture of the lower third of the right leg, with bright red blood."

In this case also one minute was allowed each captain to read his slip, after which the first-aid work was done from memory. The allotted time proved ample.

The winners and prizes awarded in this event were as follows: (1) Two solid gold rings, presented by officials of the Superior Coal Co., and two American Red Cross medals, won by J. Struthers and W. Hood, Gillespie, Ill.; (2) Two pairs of gold cuff buttons, presented by officials of the Superior Coal Co., won by J. Easton and J. Fulton, Gillespie, Ill.

There were two other prizes, also donated by the officials of the Superior Coal Co.

Undoubtedly Gillespie stands at the very head of first-aid work in Illinois, having the greatest number of first-aid teams and of trained men. The spirit of first-aid is in the very air of the town and is evidenced not only by contests, weekly meetings of first-aid societies, etc., but also by practical results obtained by its application in the mines.

BOYS' EVENT

After the two-man event, J. Boston introduced his boy team, comprising R. Harris, captain, age 12; J. Bergen, age

12; P. Shanahan, age 11; J. Shanahan, age 9; Willie Carroll, age 11; Walter Carroll, age 8.

The first problem given the boys was that of a simple fracture of the right femur, a simple fracture of the left forearm and a scalp wound on top of the head. The second problem was that of a fracture of the left collar-bone and shoulder.

These small boys performed their work so well that it looked as though they would prove dangerous rivals to teams composed of grown men. On Dec. 3, Thomas English, of the Illinois Mine Rescue Station Commission, examined these boys and they passed the state examination in first-aid in a creditable manner. Oscar Cartlidge, manager of the commission, presented the state diplomas and first-aid buttons to these boys at the contest and commended them for the excellent showing they had made in their examination. It is unusual for youths of such tender age to pass state examinations of this kind, but after witnessing their exhibition work it was evident to the spectators that they are well qualified and worthy of such an honor.

DISCOUNT OR DEMERIT LIST

The discounts in use are worthy of consideration, as they differ somewhat from those in Miners' Circular 15 of the Bureau of Mines, and perhaps suggest more mature consideration. As J. P. Reese and Dr. R. F. Knoefel, past and present presidents of the American Mine Safety Association, respectively, were both prominent in the program, the meeting was evidently official, and the discount list must have the support of leading officers of the association.

The last item in the list is entirely new. This refers to controlling hemorrhage. The 14th and 15th items, which also relate to blood control, are given increased weight, as is also "ineffective artificial respiration" and "incorrect treatment." "Failure to be aseptic" and "unclean first-aid material" are less heavily penalized. On the whole, we believe all these changes are good. Another improvement is an increase in penalty for splints improperly padded or applied.

We have added, for comparison, to the list given below the old National Mine Rescue and First-Aid Conference's discounts. The Gillespie demerits are the outcome of discussion of these earlier attempts at a fair assessment of defects in treatment, and we think show a big improvement. The changes in many cases are such as have been advocated editorially in "Coal Age." We have added the Utah Fuel Co.'s scale for comparison. It should be stated that not only the discounts, but their description and order have been changed. Hence, only the Gillespie counts are stated with verbal correctness in the table:

COMPARATIVE DEMERIT LISTS

	Gillespie Meet	Miners' Circular 15*	N.M.R. & F.A.C.†	U.F.C.‡
1. Not doing the most important thing first	6	5	2	5
2. Failure of captain to command properly	1	2	2	2
3. Slowness in work and lack of attention	2	4	2	2
4. Failure to entirely cover wound or ignorance of location of injury	4	4	2	2
5. Ineffective artificial respiration	11	10	2	5
6. Splints improperly padded or applied	6	2	2	2
7. Tight, loose or improperly applied bandages	5	6	2	2
Insecure or "granny" knot	4	5	2	2
Unclean first-aid material	3	5	..	..
Failure to have on hand sufficient and proper material to complete a dressing	3	5	..	..
Lack of neatness	2	2	..	2
Awkward handling of patient	4	5	2	2
Assistance lent by patient	3	5	3	3
Tourniquet improperly applied	7	5	3	5
Failure to stop bleeding	8	5	5	5
Not treating shock	5	5	5	5
Failure to be aseptic	7	10	10	5
Incorrect treatment	12	10	..	..
Failure to temporarily control hemorrhage until tourniquet is applied	7	..	..	..

†Schedule of National Mine Rescue and First-Aid Conference, Sept. 28, 1912.

‡Utah Fuel Co. meets at Castle Gate, Utah, July 24, 1914, nd Price, Utah, Sept. 26, 1914.

FULL-TEAM EVENT

The team contest closed the afternoon program. The nine ams, each consisting of five men, one of whom was the tient, were handled in groups of three. The problem was: motor has "jumped" the track, knocking out the leg of a mber set and allowing the timber and slate to fall. The ip rider is caught under the slate and is found between e rails and in water. On examination it is noted that his right hand is cut off at the wrist, the fifth, sixth and seventh ribs of the right side are fractured and the outer third of the right clavicle has a compound fracture. The patient is in shock and is spitting blood.

After allowing 1½ min. for the captains to read their slips, 15 minutes' time was given for the work, and this proved more than was needed. In this event the captains retained their slips.

The winners and prizes were as follows:

(1) Superior Coal Co. trophy cup, five American Mine Safety Association medals, five American Red Cross medals, $20 cash donated by Local Union No. 730 of Mine No. 1—Won by Gillespie First-Aid Association No. 3 Team; F. Fulton, captain; J. Aitken, J. Fulton, F. Fulton, Jr., and S. Trainer, patient.

(2) Five gold medals presented by the Superior Coal Co. and $15 cash donated by Local Union No. 730 of Mine No. 1—Won by Cuba, Ill.; T. B. Trigg, captain; W. B. Griffiths, G. H. Trigg, J. Griffiths, and K. Hogan, patient.

(3) Five silver medals donated by the Superior Coal Co. and $10 cash given by Local Union No. 730 of Mine No. 1—Won by Farmington First-Aid Team; W. Brown, captain; W. Prosser, W. Crane, W. Watson, and R. Connell, patient.

There were four other prize-winning teams.

EVENING SESSION

At 7 p.m. the prizes were awarded by Dr. C. W. Hopkins, John P. Reese and others. The crowd was so great that it became necessary to close the doors of the opera house before the evening sesion began. The U. S. Bureau of Mines' kinematograph of coal-mining operations was a great drawing card. However, there was much interest shown by the public during the day and the house was full throughout the afternoon as well as in the evening.

The Superior Coal Co. trophy cup was awarded by Mr. Reese, who stated that this is the third and last contest for the cup. The present winners are to have possession of it for one year and then it becomes the property of the State of Illinois and is to be kept on exhibition at the Springfield Mine Rescue Station. It was first won Dec. 10, 1912, by Superior Team No. 1: J. Weir, captain; C. Miller, J. Cowden, J. Struthers and W. Hood.

It was won Dec. 9, 1913, by the Cuba team: T. P. Trigg, captain; J. Cooper, J. H. Trigg and W. Griffith.

⁂

A Miners' Co-Operative Store

By H. D. Easton*

The Gillespie Coöperative Society, of Gillespie, Ill., had a formal opening of its $1400 store building on miners' election day, Dec. 8, 1914. This is said to be the first miners' coöperative store in Illinois. The Scotch bandsmen made a picturesque feature with their pipes and kilts while furnishing the music for the occasion.

John H. Walker, president of the Illinois State Federation of Labor, was the speaker of the day. He enlarged upon the coöperative plan and encouraged the present society to look forward to the extending of their activities until a series of such stores are built over the state and all of these units do their purchasing through a coöperative wholesale house. This store, the first of the series, has already been occupied for a few weeks, but the formal opening was deferred until the day of the Gillespie first-aid meet. The speaking was in the Clan McIntosh Hall.

The store is of brick, two stories high, and has a large basement. The ground floor is used for groceries and foodstuffs in general, the second story is for dry goods and the basement for general storage. The building occupies a corner site on the main street which makes possible excellent window displays.

No One Can Hold over $25 of Second-Mortgage or over $500 of First-Mortgage Obligations

The Gillespie Coöperative Society was organized Apr. 21, 1913, with a capital of $1600. There are about 118 local members. To become a member, the applicant must buy a share at $5; each member is limited to five of such contributions. The money thus raised is called *share capital.* Each member is given a book with a number, on which his name does not appear, so that the private affairs of the shareholders are not divulged should anyone find the book.

---

*Instructor, Illinois Miners' and Mechanics' Institutes, 1142 West Monroe St., Springfield, Ill.

After a member has purchased his five shares, he is allowed to deposit money which is called loan capital; but of this he is not allowed to obtain more than $500. These two forms of capital are somewhat like common and preferred stock; the share capital draws 5 per cent. interest and the loan capital 4 per cent., each being paid quarterly. In case of financial difficulty, the loan capital has first claim on any available assets.

The division of the net profits, after paying all running expenses and the interest on the two forms of capital, is proportioned according to the amount of purchases made by the members. A member buying $100 worth of goods would receive twice as much dividend as another who had purchased but $50 worth. Of course, none but members participate in this dividend.

A STORE ERECTED BY MINERS TO SUPPLY THEIR OWN NEEDS, GILLESPIE, ILL.

DETAILS OF MANAGEMENT

Quarterly meetings are held and each member is fined 25c. for failing to attend a meeting. There is a board of directors consisting of nine men, three of whom are elected each quarter. There are three auditors, one of whom is appointed each quarter by the directorate. This plan always leaves experienced men both on the board and acting as auditors. A manager, the present incumbent being Herman Sies, is hired by the directorate. He, through the board, employs the necessary assistants.

The society plans to handle practically everything that a family needs and to carry none but first-class goods with prices according to value. No prices are to be cut. At present, the second story of the store is devoted largely to ladies' coats; there is to be special attention paid to certain lines in season and then, as the members become stocked up with the particular line, other goods will be taken up in the same manner.

CREDIT GIVEN WITHIN $10 OF HOLDING

The system of bookkeeping is greatly simplified by allowing and encouraging each member to purchase on credit goods of a value aggregating $10 less than his total capital. Fifteen dollars must be invested before credit can be given. As stated, a capital of $15 allows a $5 credit.

Many of the members prefer to invest their savings in loan capital rather than to leave the money in a bank. The Society not only allows 4 per cent. interest but compounds this increment quarterly.

The present board members are: Peter Harris, Jim Harris, Clyde Bernard, David Shaw, Doctor English, Mike Blaske, John L. Templeton, William Osborne and L. P. Preston. The other officers serve for one year and are: David McKaig, president, James Cowan, vice-president, Robert McKechan, secretary, and W. E. Schmidt, treasurer. Both the board members and officials are eligible for reëlection but cannot serve for more than two consecutive terms. The auditors' report shows the number of meetings attended by each official.

The coöperative plan is not new but is being followed with success especially in some colleges and universities. It is a long step from the old-time company store to the coöperative, but a step in the right direction. When miners become active in keeping up their own first-aid societies, coöperative stores, etc., they will have acquired an interest in local affairs that will lead very naturally t owning their own homes. All these movements favor th building up of a community of earnest, contented me and that in turn brings much help toward gaining peac and prosperity for both operators and miners.

SOME DETAILS AS TO FINANCE

[The auditors prepare a full and detailed report eac quarter. From it we learn that $2802.25 of share capita is owned by 118 members, making an average $23.75 pe member, which closely approximates the maximum pos sible holding of $25. The loan capital amounts t $3111.15 and is held by 91 members, making an averag of $34.18 per loan holder. The largest holding is $325.8 and the smallest $0.11.

The grocery stock is valued at $2772.45, the dry goo at $2121.67. The cash on hand and balance in bank tot to $2526.65. The total resources were $7921.44. The are $1374.14 of outstanding bills. The quarterly intere on shares and loan capital aggregated $46.63; the div dends on purchases for the quarter amounted to $423.4 The total sales are not given but the purchases of t store are recorded as $7702.68 in the three months pa During that same time $850.25 was paid for salaries a delivery of goods.

The figures are not large but the showing is commen able and it must be remembered that it closes already t fifth quarter of trading.—EDITOR.]

*

The number of coal mine disasters in the United Sta decreased 38 per cent. in 1913 according to the Fourth Ann Report of Joseph A. Holmes, director of the United Sta Bureau of Mines. "Although there was a slight increase the number of fatalities in coal mines," says the rep "owing to two large disasters, it is gratifying to know t there was a reduction in the number of accidents. Duri the calendar year 1913 there were eight disasters in wh more than five men were killed, as compared with 13 simi disasters in 1912, a reduction of 38 per cent.

Discussion By Readers

Mining Laws, Legislation and Mine Regulations

Letter No. 20—I want to suggest, in connection with the discussion of mining laws and legislation, that law makers can do much to increase safety in mines, if they will take up the matter of the fireboss and the shotfirer, and read into the mining laws of the state, a more definite statement of what these officials are expected to do during the working shift.

My observations lead me to the conclusion that, in many mines today, the fireboss and shotfirer have more work to perform than they can do properly in the time allotted them. In other words, they are unable to fulfill the requirements of the Coal Mines Regulation Act, in these circumstances and under the prevailing conditions. Such a state of affairs can only be remedied by a law fixing some standard amount of work that must be performed during the shift and which cannot be exceeded. In other words, the work a shotfirer is expected to perform should be so limited by law that it can be properly executed. If this matter be given proper attention by legislative bodies, I believe it will have a far-reaching effect and be of incalculable value in promoting safety in mines.

"Safety First" has become a very familiar phrase; and many large coal-mining companies are making it their slogan, for which they are to be commended. They reap the benefit, however, of their efforts in this direction quite as much as their employees. On the other hand, there are companies that do not push the "Safety First" proposition. I will not say that they do not favor it, however; but under the conditions so common to coal mining; such as a poor quality of coal, difficult mining conditions, keen competition in the markets and other causes, the adopted slogan "Safety First" is replaced by another, which is kept continually before the eyes of every mine official.

The cry is constant, "Coal! coal! coal!" No matter *how*—coal must be produced at the lowest possible cost, the only alternative being to close the mine. The company does not say "Take any and all risks to attain this result." But that is practically what it means. The factor of safety is almost wholly eliminated from the proposition. Consider, for a moment, the case of a fireboss in such a mine. His responsibilities, I venture to say, are equal to those of any other mine official. He is often required to fulfill the duties of both fireboss and shotfirer, in which case his responsibilities are increased three- or four-fold. In such capacity, he is called upon to fire all the shots in his section and to look after the general safety of all working places, traveling roads, ventilation, etc., as required by the Coal Mines Regulation Act.

It is easy to understand, that, in order to do this work conscientiously and properly, the fireboss should have a limited number of places in his charge or a certain number of men. I have known cases where the fireboss had a larger territory than was possible to examine in strict compliance with the requirements of the act, within the time at his disposal. I have known such men to give up their positions, on that account, rather than be compelled to face the chance of a possible accident, for which they would be held responsible and the later investigation of which would result in their being deprived of their fireboss papers and stamp them as unreliable men.

In such cases, the position is again quickly filled, probably by a man who has recently succeeded in getting his papers and is elated at obtaining and anxious to hold the position he secures. It is this that makes him willing to take the chances mentioned. The miners and other workmen in the mine know well enough that the law is not being carried out, and they, in turn, get careless likewise.

Obviously, the result is bad and the moral seems to be quite clear, "If the boss does not enforce and carry out the Coal Mines Regulation Act himself, how can he expect his men to do so?" This condition naturally continues until the headlines of the daily papers announce the occurrence of a disastrous explosion. The later investigation fails to discover the actual cause of the disaster, though many theories are advanced to explain the mystery.

VIGILANT.

British Columbia, Canada.

⁂

Humidifying Mine Air

Letter No. 1—Referring to the interesting inquiry, in regard to the humidifying of mine air, COAL AGE, Jan. 2, p. 29, the statement of "Miner" that the humidity imparted to the air current by the exhaust steam is practically lost at a distance of 600 ft. from the bottom of the downcast shaft, shows that he is not putting enough exhaust steam into the air passing down the shaft, to produce good results at all times.

My own practical experience has taught me that, with the winter temperatures one may expect in Ohio, it will require 1 hp. of exhaust steam for each 1000 cu.ft. of air entering the shaft. This will, of course, depend, to a certain extent, on the distance it is necessary to convey the exhaust steam before it reaches the downcast shaft. No doubt the amount I have mentioned will seem excessive; but when one considers that the thermometer often registers below zero, and that it is necessary, therefore, to regard such conditions, it will be readily seen that the amount is not in excess.

I would recommend that "Miner" increase the amount of exhaust steam delivered to the air current; and make frequent tests with a sling psychrometer, until the readings show, say 93 per cent. relative humidity in the live workings, which he states are 4000 ft. inby from the downcast shaft. Such relative humidity should be obtained when the outside temperature is at or near the freezing point; and, then, if the temperature should drop for a few days, there will no doubt be sufficient moisture in the mine to tide over this condition.

I would also recommend the placing of a two-way valve on the exhaust header, so that it will be possible to regulate the supply of steam according to the requirements. When the steam supplied to the intake current is sufficient one should be able to notice a steam fog or mist for a distance of at least 1500 to 2000 ft. inby from the shaft, days when the outside temperature is zero or thereabouts. If necessary, a 1½-in. live-steam line could be connected with the top of the downcast shaft, for emergency use in extremely cold weather.

A very good test, for observing the dust conditions in the mine, is to place sheets of white paper at various points in the entries and the workings; and observe how much dust collects on these, in a certain time, say weekly. I feel certain that if "Miner" will work along these lines, he will be amply repaid.

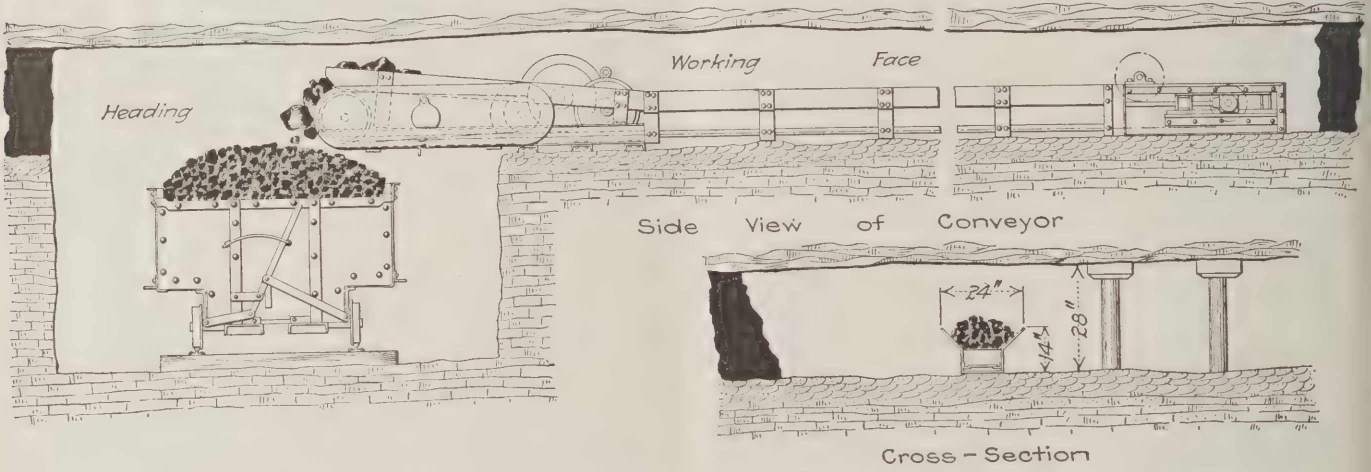
George Morris,
Mining Engineer.

Ralphton, Penn.

Loading Coal by Machinery at the Face

I believe the inquiry of John Harvey, Coal Age, Dec. 5, p. 920, refers to a mechanical coal conveyor, to be installed along the coal face, in a thin seam where it is impossible to take the cars because of a lack of headroom. As I have had considerable experience, in Scotland, in the handling of coal by means of the Blackett coal conveyor, at the working face of a thin seam of coal, I thought the following description would be of interest to Mr. Harvey and others.

This conveyor, which was 300 ft. long, was installed at a cost of $2000. I believe the seam of coal described by correspondent is admirably adapted to the use of a conveyor, as the most important consideration when installing such a machine is a good roof and bottom that will allow sufficient open space for its operation, so that the conveyor will not be impeded by unnecessary timbers and fallen coal. The hard sandrock floor and limestone bottom will require little timbering in the open space along the face of the coal. I have seen the conveyor worked successfully in a seam 2 ft. thick.



Sectional View and Cross-Section at Longwall Face, Showing a Link-Belt, Loading Conveyor

The Blackett conveyor required two men, at the loading end of the machine, for topping and switching the cars as they were loaded and for operating the conveyor. The machine was run by a 7-hp., three-phase, alternating-current motor. The mine cars held only 8 cwt., or 896 lb. (taking the cwt. as 112 lb.). When running the conveyor at its full capacity, we could load 60 of these cars per hour; but this supply of coal could not be maintained throughout the day. The 10 men working on this 300-ft. face of coal would average from 230 to 240 cars of coal per day or, say something over 100 short tons; but this would run the conveyor scarcely four hours.

In the seam to which I refer, before the installation of the conveyor, the men averaged only 3 tons of coal per man per day. By means of the conveyor, this output was increased to from 8 to 10 tons of coal per man per day. Again, previous to the installation, it had been the custom to pay for the mining and hauling of the coal to the side track, a distance of ¼ of a mile, a rate of 62c. per ton. Boys were employed for this purpose, except where the grade of the road was too steep for them to handle the cars, where men had to be used. This rate for mining and hauling the coal to the side track was reduced by the installation of the conveyor to 31c. per ton.

I may say that this installation was made in a seam 4 ft. thick, having a dip of 1 : 6, which was increased in places to 1 : 4. The levels were driven on the strike of the seam, about 300 ft. apart, cutting off the rooms driven up from the level below. Main headings were maintained every 300 ft. apart, and these were equipped with a drum and brake operated as a self-acting incline.

When it was decided to install the conveyor at the face, this was straightened and opened to a width sufficient to admit the conveyor line and still give room for the mining of the coal. For this purpose, the roof required to be supported temporarily by timbers, and "chocks" were built below the line of the conveyor. From 3 to 4 ft. of bottom had to be lifted on the main heading to permit the mine car to pass under the loading chute at the end of the conveyor. In this system, as the longwall face advanced, the temporary timbers were removed at the face and the conveyor moved forward.

The advantages claimed for the conveyor and verified, in our case, are the following:

1. A largely increased output of coal, per man per day, as the miner having no cars to handle, devoted his time wholly to the production of coal.

2. Decreased cost of maintenance and operation, per ton of coal mined.

3. Better working conditions and less timber, rails, etc., required, owing to the more rapid advance of the working face.

4. A more satisfied class of workmen, because the laborious handling of cars is avoided in this system.

THOMAS MULHOLLAND.

Ensley, Ala.

[In response to our inquiry, in reference to the installation of longwall conveyors, in the working of thin seams of coal in this country, the Link-Belt Co. has kindly sent photo of this machine, which we have reproduced, together with the following information:

Two of these machines were installed in the 28-in. veins of the Pennsylvania Coal Co.'s mines, at Dunmore, Penn., last April. These machines were set up on 250-ft. centers, in 16-ft. sections. The conveying medium consists of a single strand of H-type chain, having a 5-in. pitch and being 9 in. wide. The chain, which conveys the coal along a trough as illustrated in the accompanying figure, is operated at a speed of about 90 ft. per min. This machine was installed on a contract guaranteeing a capacity of 10 tons of run-of-mine anthracite per hour, with uniform loading. Each machine is equipped with a 7½-hp., back-geared electric motor, the gearing being provided with metal guards. As the coal face advances, the machine is moved forward by hand, using crowbars, chain blocks, or other simple means.

Two similar machines were also installed at the Hillside Coal & Iron Co.'s mines, at Mayfield, Penn., last September. The machines are in constant operation and giving good satisfaction, by accomplishing the work for which they were designed.—EDITOR.]

The Foreigner in Mining

Letter No. 12—The recent discussion of the foreigner in coal mining has been of great interest, particularly to the foreigners themselves—those who could read and understand English. There are many such among COAL AGE readers and they have read every word thus far written. I am one of these and was glad to notice Mr. Lantz' suggestion, in Letter No. 10, COAL AGE, Dec. 26, p. 1035, that the views of foreign-born mining men who have become Americanized and have adopted American standards of living would be interesting and valuable.

My practical experience in coal mining, during the last 20 years, has shown me that there is much unfair treatment of the foreigner in mining and that he is not given the same chances to advance and improve himself that are afforded American miners. As an illustration of this fact, I will cite one particular case in which a few native-born foreign boys had attended a night school where they studied for fireboss certificates. They, later, passed the examination successfully, received certificates of competency and filed their several applications for the position of fireboss, in the mine office. When there was an opening, however, the mine foreman sent for a few good American-born men; and the superintendent, who was a college-educated man, but knew little more of mining than an ordinary wood-chopper, was induced to appoint the newcomers, instead of the foreign-born boys who should have stood the first chance. In this way, the mine foreman actually put one over on the mine superintendent when he shoved these men back who were in every way competent to fill the position and brought new men to the mine to fill the places.

One may ask, "What chance does that give a foreigner, or what encouragement does it offer him to educate himself?" Had the mine foreman, in this case, been square and the superintendent a man of experience, and these men had been shoved along as they were able to go, they, in turn, would have started a hundred others on the same track, as it would have proved the benefit they had received from their education. But, I have not told all; the worst was yet to come. Later, when hard times occurred, the foreigners and their boys were laid off entirely. The mine foreman had no work for them: but single men—Americans—were kept at work, while these married foreigners, many having large families, were thrown idle. The boys who had studied were ridiculed by their less ambitious fellows, who taunted them with, "Well, aren't you fools; never going to get a job of firebossing; youse won't never be American citizens—not with such dirty officials as we have to work under"; and other like remarks.

I want to say, in closing, that many coal operators make a mistake in their treatment of the foreigner, and particularly the native-born foreigner. It is a fact worth observing that the children of these foreigners are being educated. They are ambitious; many of them are looking forward to a college education, and are making rapid progress. Few of them, indeed, will be contented to draw coke or dig coal all their lives.

It would be interesting and instructive to know what percentage of English, German, Swedish and Bohemian miners has been killed in the mines, during the past year. I believe they are the best class and highest grade of miners now employed in the mines of this country.

A FOREIGNER.

Mt. Pleasant, Penn.

Letter No. 13—I have been much interested in the discussion now in progress in COAL AGE, regarding the education of the foreigner. Inasmuch as one correspondent invites the opinions of foreigners, I am induced to break into the discussion.

As one who came from Europe, direct to the coal fields, several years ago, I have an intimate knowledge of the character, habits and aspirations of those humble persons now arriving from the Continent in such numbers. I have been in close working contact with many of this class, who, like myself, have become more or less Americanized. Also, having previously had many years' practical experience in educational matters, especially the education of workingmen, I have unconsciously formed the habit of observing and comparing the educational standards of the communities in which it has been my fortune to dwell. In this respect, I have had many opportunities of comparing the general education of the foreigner with that of the American workman in the coal fields of this country. I regret to say that the result has not always been to the credit of the American miner.

Many of the aliens who come direct to the coal fields from the mining countries of Europe are experienced miners and possess a good rudimentary education. But, the American miner is very prone to look upon even these with disdain, simply because they do not speak the language or understand what is said to them. There are besides, of course, a large number of a lower grade of foreigners, who reach the coal fields from the farming districts of Europe. As a rule, these gravitate to the coal fields from the larger cities where they have been long enough to obtain a fair knowledge of the country and the language. The most of this class do not aspire to enter the mines; and only do so because of their need of work or at the solicitation of friends already in the mines.

What the foreigner most needs is to learn the language sufficiently to enable him to speak it and understand what is said to him. They pick up this knowledge more rapidly in their daily work than by attending educational classes. In my opinion, any further education given them should be in the nature of acquainting them with the dangers of mining and the duties and responsibilities of citizenship in this country. The work of making a good citizen out of the foreigner is too often neglected.

Anyone familiar with the situation knows that far too many foreigners come to this country for the purpose of making easy money in a short time. They are sending this home to pay for the farm that they are anxious to go back and work. It would be better for the coal districts and the country at large if the foreigners we employ were given to understand that they must get their families here and be naturalized within a given time, say a year. It is not wisdom to have so many of these men crowded into the mining camps and living in the most degraded manner possible—often like hogs. The general tone of the camp is lowered because of their inordinate desire to save money and send it home. The natural result is to prejudice the mind of the American workman, who fails to realize that this is not their normal habit of life when in their own country.

To force this class of foreign labor to *declare their intention of becoming citizens of this country, within a year,* would probably mean a reduction of their number in the coal fields; but the grade of labor remaining would be of a far superior quality, and the talk of their education would be unnecessary.

It has been my observation that where the population in the coal fields consists of foreigners who are married and settled with their families, in their own homes, the workers prove to be the most reliable and respectable it is possible to employ. I believe, therefore, that everything should be done, in the way of education, to persuade or even compel this class of labor coming into the country to declare their intention of settling here and becoming good citizens. In closing, I may say that, while I believe in education, I am convinced that the foreigner needs no more attention, in this respect, than the average American workman.

WESVANIA.

Study Course in Coal Mining

By J. T. Beard

The Coal Age Pocket Book

CENTRIFUGAL PUMPS

The low cost of electricity and its increasing application for power and lighting, in mining work, together with the ease of installation and the flexibility and small expense for maintenance of the system has resulted in the development and successful adaptation of the centrifugal pump to mining conditions and requirements.

The centrifugal pump is, by its very nature, an electrically driven pump, owing chiefly to the high speed of rotation required for the development of its centrifugal force, and the same high speed of rotation is the prime feature of the dynamo or electric motor.

Efficiency—Motor-driven pumps of the centrifugal type present features capable of developing high efficiencies. It is now possible, by the improved design of the impeller and its casing, to obtain the same high efficiencies for all heads up to 250 ft., which fact alone adapts them to mining use.

What is generally understood as the "pump efficiency" is the **ratio of output to input;** which in centrifugal pumps is the ratio of the work performed (ft.-lb. per min.) to the brake horsepower reduced to the same basis. The "overall efficiency," which is a term sometimes used, includes the combined efficiencies of the motor and the pump. It is the ratio of the work performed (ft.-lb. per min.) to the kilowatts delivered to the motor reduced to the same basis. The efficiencies of the better class of these pumps vary from 45 to 78 per cent., depending on size of pump and head.

Rated Size of Pump—Centrifugal pumps are rated, in respect to size and capacity, by stating the diameter, in inches, of the discharge. Thus, an 8-in. centrifugal pump is one having a discharge connection 8 in. in diameter. This is also called a "No. 8 pump."

Size Required for Given Capacity—It is possible to estimate approximately the size or number of pump required to deliver a given quantity of water, G (gal. per min.), on the basis of an assumed average velocity of discharge of, say 12 ft. per sec., for heads varying from 80 to 90 ft.; and assuming, further, that this velocity will vary approximately as the square root of the head.

For example, calling the required diameter of discharge d, in inches; the desired capacity of the pump G, in gallons per minute; and the given head h, in feet, the calculation is as follows, on the basis of a velocity of 12 ft. per sec., under an average head of 85 ft.:

$$G = \frac{60 \times 12 \times 12\,(0.7854\, d^2)}{231} \sqrt{\frac{h}{85}} = 3.186\, d^2 \sqrt{h}$$

and, for the required diameter of discharge,

$$d = 0.56 \sqrt{\frac{G}{\sqrt{h}}}$$

However, since the sectional area of the volute, at the cut-off, is the factor determining the discharge, the above formula, at times, gives rise to misunderstanding.

The Coal Age Pocket Book

The Single-Stage, Centrifugal Pump—There are two general types of centrifugal pumps; namely, **volute and turbine** pumps. The "volute" type receives its name from the spiral form of casing that surrounds the impeller and conducts the water flowing from the impeller to the discharge pipe or nozzle. Volute pumps are generally single-stage pumps. The volute is the standard type of centrifugal pump, for all capacities and for all heads up to 250 ft.

The accompanying figure shows an outside view of a 10-in., double-suction, volute, motor-driven pump. All centrifugal pumps have the following essential elements or parts that combine to form the pump proper: **1.** A shaft that transmits the power from the motor to the pump. **2.** An impeller mounted on the shaft and rotated by it at a high speed. **3.** A casing that surrounds the impeller and confines the water within the pump till it is finally discharged at the nozzle or into the column pipe leading to the surface.

CAMERON TEN-INCH, DOUBLE-SUCTION, MOTOR-DRIVEN, CENTRIFUGAL PUMP

Advantages of Centrifugal Pumps—In this type of pump there is the entire absence of complicated parts such as valves, pistons, etc. Less floor space is required; cost of installation and maintenance is lower for the same service; and the action of the impeller is continuous, producing a steady discharge and eliminating shock and noise. The interior of the pump is readily accessible for inspection without disturbing any pipe connections or the alignment of the pump.

Inquiries of General Interest

The Simple Vernier

What is the principle of a simple vernier, by which it is possible to read with accuracy to a smaller division than that on the scale? Are all verniers constructed and read alike?

SURVEYOR.

Bethlehem, Penn.

The principle of the vernier depends on its divisions being less or greater than the divisions of the scale, by a certain fractional or decimal part of the scale unit. There are two kinds of verniers—the *direct* and the *retrograde*. In the direct vernier, the divisions on the vernier are shorter than those on the scale. In the retrograde vernier, which is not so common as the direct, the vernier divisions are longer than those of the scale.

A scale may be graduated for any unit of measure; as, for example, feet, inches, degrees, etc. The vernier may, then, be so divided as to read any fractional or decimal part of such unit.

Referring to the accompanying figure, the divisions of the scale marked 1, 2, etc., may represent feet or inches. These being divided, in this case, into ten smaller divisions, this scale is a decimal scale and each of the smaller divisions marks $\frac{1}{10}$ of the scale unit, whatever this may be.

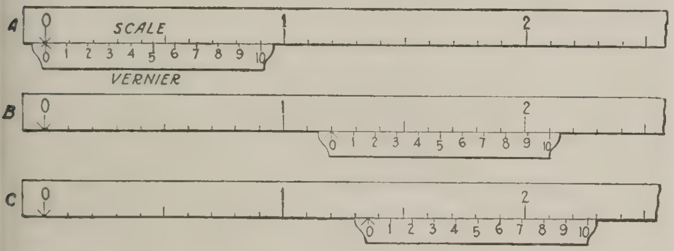

DIAGRAM ILLUSTRATING THE SIMPLE VERNIER AND SHOWING THREE POSITIONS ON THE SCALE

Now, in order to divide these smaller divisions again into ten parts, each of which will measure $^1/_{100}$ part of the scale unit, it is necessary to so graduate the vernier that ten divisions shall be equal to nine divisions of the scale (direct vernier) or to eleven divisions of the scale (retrograde vernier).

The vernier shown in the figure is direct, ten of its divisions corresponding to nine divisions of the scale, as shown at *A*. This makes each division of the vernier measure $\frac{9}{10}$ of a division of the scale. In other words, each vernier division is $\frac{1}{10}$ less than a division of the scale; and this difference measures, therefore, $^1/_{100}$ of the scale unit.

When reading, the position of the index of the vernier is first read on the scale. In the figure, the vernier is shown in three positions; at *A*, the vernier index reads zero; at *B*, the vernier index reads 1.2; at *C*, the vernier index reads something more than 1.3; and the excess must be read from the vernier, by observing the lines of coincidence where a vernier division exactly corresponds to a division of the scale, which is here the sixth division of the vernier. Since each vernier division is less than the scale division by $^1/_{100}$ of the scale unit, it is evident that the vernier index has advanced $^6/_{100}$ of the scale unit beyond the reading 1.3; and the full reading, in this case, is therefore 1.36.

It is important to notice that a direct vernier must be read forward, in the same direction as the scale is read. In a retrograde vernier, the vernier index is at the other end of the vernier, and the vernier is read back from this index or in the reverse direction from the reading of the scale.

⁂

Problem in Surveying

Kindly explain how the horizontal and vertical distances are calculated from the pitch distance, in surveying a breast or heading in an inclined seam. For example, if the heading has a pitch of 45 deg. and the measurement is 200 ft. on the pitch, what is the corresponding horizontal distance and the vertical rise?

ROBERT KRAMER.

Trevorton, Penn.

It is customary when surveying on steep inclines to make all measurements on the pitch or the dip of the seam, as the case may be. In order to reduce pitch or dip measurements to the horizontal and vertical distances, it is usual to employ a table of sines and cosines. For example:

$$Horz.\ distance = pitch\ distance \times cos\ \ pitch\ angle$$
$$Vert.\ distance = pitch\ distance \times sin\ \ pitch\ angle$$

The sine and cosine of 45 deg. are each 0.707, as given by the table of sines and cosines. Therefore, for a distance of 200 ft. measured on the pitch,

$$Horz.\ distance = 200 \times 0.707 = 141.4\ ft.$$
$$Vert.\ distance = 200 \times 0.707 = 141.4\ ft.$$

Since the angle of inclination or the pitch angle, in this case, is 45 deg., the three lines representing, respectively, the pitch, the horizontal and the vertical distances, form a right isosceles triangle, the horizontal distance being equal to the vertical distance, and the pitch distance being the hypotenuse. In this case, therefore, the square of the pitch distance is equal to twice the square of either the horizontal or the vertical distance, according to the rule, in geometry, that the square of the hypotenuse of a right triangle is equal to the sum of the squares of the two sides, which gives, in this case, the two sides being equal,

$$Horz.\ or\ vert. = \frac{pitch}{\sqrt{2}} = \frac{200}{1.414} = 141.4\ ft.$$

Also, since the sine of 30 deg. or the cosine of 60 deg. = 0.5, the vertical distance on a pitch of 30 deg. is always one-half of the pitch distance; and, likewise, the horizontal distance on a pitch of 60 deg. is one-half the pitch distance.

Examination Questions

Miscellaneous Questions

(*Answered by Request*)

Ques.—Calculate the following notes taken from a "level book"; and give the elevation of each station referred to the bench mark, whose elevation is 20:

Sta.	B.S.	I.S.	F.S.	Remarks
B.M.	6.70	....	....	Elevation of bench = 20
1	....	3.40	....	
2	....	4.20	....	
3	....	2.80	....	
4	....	5.70	....	
5	....	1.80	....	
6 T.P.	....	....	2.90	Sta. 6 = turning point
	8.30	....	....	
7	....	7.40	....	
8	....	6.50	....	
9	....	2.80	....	
10	....	8.40		
11	....	3.50		
12	....	2.40	....	
13	....	4.70	....	
14 T.P.	....	....	1.80	Sta. 14 = turning point
	5.40	....	....	
15	....	2.20	....	
16	....	6.80	....	
17	....	4.30	....	
18	....	....	3.82	

Ans.—In leveling, the backsights (B.S.) are all plus (+) sights, and must be added to the elevation of the bench mark (B.M.) or turning point (T.P.) on which the rod is held. The intermediate sights (I.S.) and foresights (F.S.) are all minus (—) sights and must be subtracted from the height of instrument (H.I.) to find the elevation of the station, which gives the following:

Sta.	B.S.	I.S.	F.S.	H.I.	Elevation
B.M.	6.70	....	....	....	20.00
1	....	3.40	....	26.70	23.30
2	....	4.20	....	....	22.50
3	....	2.80	....	....	23.90
4	....	5.70	....	....	21.00
5	....	1.80	....	....	24.90
6 T.P.	....	....	2.90	....	23.80
	8.30	....	....	32.10	....
7	....	7.40	....	....	24.70
8	....	6.50	....	....	25.60
9	....	2.80	....	....	29.30
10	....	8.40	....	....	23.70
11	....	3.50	....	....	28.60
12	....	2.40	....	....	29.70
13	....	4.70	....	....	27.40
14 T.P.	....	....	1.80	....	30.30
	5.40	....	....	35.70	....
15	....	2.20	....	....	33.50
16	....	6.80	....	....	28.90
17	....	4.30	....	....	31.40
18	....	....	3.82	....	31.88
	20.40		8.52		

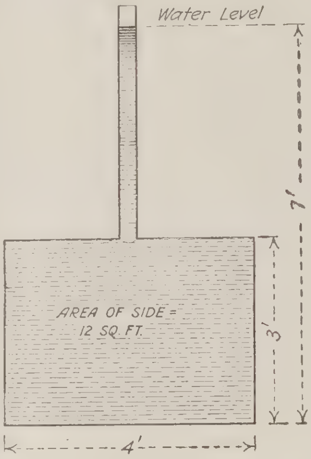
Proof 20.00 + 20.40 — 8.52 = 31.88.

Ques.—Explain how it is that finely pulverized clean coal ash when mixed into a stiff paste to which some common table salt (NaCl) is added makes a very good temporary substitute for fireclay.

Ans.—Ordinary coal ash contains dioxide of silica (SiO_2), sesquioxide of iron (Fe_2O_3), oxide of alumina (Al_2O_3), oxide of calcium (CaO) and magnesium oxide, (MgO). The addition of common salt or sodium chloride (NaCl) and water (H_2O) provides all the constituents of plastic fireclay, except the oxides of sodium and potassium, and the latter is often present either as the monoxide (K_2O) or the unstable peroxide (K_2O_4). There is therefore formed, by the addition of the salt and water, a mechanical compound closely resembling fireclay.

In the case of an ash from which considerable clinker has been sifted, we find also sulphate of lime ($CaSO_4$) and phosphoric acid in some of its forms, all of which deteriorate the value of the clay. Fireclay can thus be made for emergency use, for temporary repairs to fireboxes, etc.

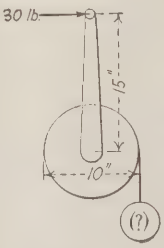
Ques.—Find the total pressure on the vertical side and total pressure on the bottom of the rectangular tank illustrated in the accompanying figure. The size of the tank is 4x4 ft. on the bottom and it is 3 ft. high. Into the top of the tank, which is closed, is inserted a pipe. Water is poured into this pipe and fills the tank, and also the pipe to a depth of 7 ft. above the bottom of the tank.



Ans.—The area of the vertical side of the tank is 3 × 4 = 12 ft. The water pressing on this vertical side has a mean head equal to the depth of the center line of this side below the level of the water in the pipe, or 7 — 3/2 = 5½ ft. The total pressure on the vertical side is, then, 12 × 5.5 × 62.5 = 4125 lb.

The area of the bottom of the tank is 4 × 4 = 16 sq.ft. The head of water pressing on the bottom is 7 ft. The total pressure on the bottom of the tank is, then, 16 × 7 × 62.5 = 7000 lb.

Ques.—What weight will a man be able to lift with a windlass, by exerting a constant force of 30 lb. on the handle? The radius of the handle is 15 in. and the diameter of the windlass barrel 10 in.



Ans.—In this case, the lever arm of the force exerted is three times that of the weight lifted, the former being 15 in. while the latter is one-half the diameter of the drum, or 5 in. Therefore, the weight lifted will be three times the force exerted, or 3 × 30 = 90 lb.

Ques.—A certain volume of air is under a pressure of 15 lb. per sq.in., at a temperature of 36 deg. F. What temperature will be required to increase the pressure of this air to 23 lb. per sq.in., assuming the volume remains unchanged?

Ans.—Assuming that the given pressures are the total pressures above a vacuum and remembering that, for the same volume of air, the absolute temperature varies directly as the absolute pressure exerted on the air and *vice versa,* which makes the absolute-temperature ratio equal to that of the absolute-pressure ratio; and calling the required temperature of the air *t*, we have

$$\frac{460 + t}{460 + 36} = \frac{23}{15}$$

$$t = \frac{23\ (460 + 36)}{15} - 460 = say\ 300°\ F.$$

Coal and Coke News

Harrisburg, Penn.

Three indictments, with a total of 126 counts, charging the Philadelphia & Reading Ry. Co. with violations of the interstate commerce laws relating to the transportation of anthracite and bituminous coal between Philadelphia and New England points were found by the Federal Grand Jury on Jan. 7. No date has as yet been fixed for the trial of the case.

Fifty-one counts in one indictment charge the railway company with failing to file with the Interstate Commerce Commission schedules of its rates and charges for coal transported over the Philadelphia & Reading transportation line of barges and tugs, which it owns, running between the coal fields in Pennsylvania and New England ports.

The indictment covers a period from Oct. 1, 1913, to Apr. 1, 1914, and involves continuous shipment of anthracite from St. Clair and Schuylkill Haven, Penn., to numerous points, including Boston, East Cambridge, Charleston, Brookline, Milton and Salem in Massachusetts and to Portland, Gardiner, Rockland and Bar Harbor, Maine.

There is also a charge against the company that it favored some of its shippers, especially the Philadelphia & Reading Coal & Iron Co., by granting them privileges and facilities in transportation that were not accorded to their competitors.

By its ownership of mines and rail and water lines the component parts of the Reading system have obtained a large control over the supply and output of coal through all of the New England territory. This power of control is largely attributed to the fact that the railway company is not dependent upon the rail routes to New England for service in carrying the coal but through its ownership of the barge line it is enabled to transport anthracite to New England at a cost lower than that imposed upon its competitors.

The railway company has never regarded its barge line to be within the regulations of the Interstate Commerce act, and upon this theory, has never filed with the commission tariffs showing its rates of transportation over the water route.

Should it be decided by the court that the barge line rates and charges must be published in tariffs and filed with the commission, all shippers will be given the privilege of using the barge line under exactly the same conditions as are now enjoyed by the Philadelphia & Reading Coal & Iron Co.

In the second indictment the railroad is charged with granting concessions to favored coal shippers by failing to collect demurrage charges on carloads of coal that have been held in the railway's yards more than 48 hours after the cargo reached Port Richmond. For 48 hours after a shipment reaches the point of destination it is held by the railway without charge to the consignee. For each succeeding day a carload is held in the yards, a demurrage of $1 is to be charged, according to the regulations of the Interstate Commerce Commission.

The indictment cites 50 instances where favored shippers had their cars detained at Woodlane yards, 8 miles from Port Richmond for many days beyond the time limit allowed for discharging the cargo, but the railway company made no claim for demurrage.

The period of these alleged violations is from Mar. 1, 1913, to Apr. 1, 1914, and are connected with bituminous coal shipped from West Virginia to Port Richmond, for transshipment to other points. Among the shippers alleged to have been favored by this method are the Mosco Iron Co.; the Glen Brook Coal Co., and the Hutchinson Coal Co.

Competitors of these companies, it was said, were not allowed these concessions, but were compelled to take their cargoes at their destination in Port Richmond, and if delay occurred necessitating a detention of 48 hours they were compelled to pay the demurrage charges.

The third indictment is substantially of the same character as the preceding one. It charges that between July 1, 1913, and Apr. 1, 1914, the railway company failed to collect demurrage on 25 rail shipments from mines to Port Richmond.

Whitney & Kemmerer, Blair Parke Coal & Coke Co., and the Maryland Coal Co. are cited as being favored also by the railway company in being relieved of demurrage charges.

After finding the indictments, it was stated that the aggregate of fines that could be imposed should the Government prove its charges would be $1,650,000, but it is not likely that the court would go to that extent in inflicting punishment.

It was stated that the questions of law involved in the cases are very interesting, and of importance not only to the railway company, but to the public as well. They concern the shipment of both anthracite and bituminous coal from points along the lines of the Reading railway and its connecting carriers to points along the coast of New England.

PENNSYLVANIA

Anthracite

Nanticoke—The distinction of having the greatest output of coal of any breaker in the anthracite region for the year 1914, is held by the Truesdale colliery of the D. L. & W. R.R. Co. The Prospect colliery of the Lehigh Valley Coal Co. ranks second in the list in coal production and is closely followed by the Woodward colliery of the Lackawanna company. The figures for the production in 1914 are as follows: Truesdale, 1,152,201; Prospect, 1,097,973; Woodward, 1,053,461. A feature in regard to the success of the Truesdale colliery is that it is the second colliery in the anthracite region to be electrically operated.

Scranton—Arrangements have been completed by the Delaware, Lackawanna & Western Coal Co. to give moving picture shows to all the employees, depicting safety means and methods and showing the right and wrong way of doing work in the mines. The company thinks by this method all the employees can be sufficiently schooled and educated as to the right way to prevent accidents and also how to act in case of accidents. Prizes amounting to over $100 will be given by officials of the company to employees at any of its collieries who submit the best suggestions for the promulgation of the safety movement. These suggestions must be written and handed in before Mar. 1, and each contestant is limited to 1000 words.

Avoca—That the property and employees of the Pennsylvania Coal Co., at its No. 6 colliery, are well protected from fire, was shown on Jan. 9, when a fire drill was held at 10:09 a.m. Forty-eight seconds after the sounding of the five short calls of the Erie system, several different plugs were opened, the hose stretched and ready for service and the entire 187 men and boys of the breaker were out in the open. This is the fastest time yet made. This is the same set of fire fighters which last year made the record of 53 seconds to prepare for action and this time was never equaled until they lowered it themselves. The test was an unexpected one, it never being thought that with the frigid weather a call would be made.

Hazleton—Cold weather found most of the springs and bore holes dry with no possibility of reopening until the frost leaves the ground in the spring. Mines are hampered for lack of water to run their boilers and pumps and devices to melt snow and ice are being installed at many collieries. With business brisk at the mines, suspension because of drought would mean heavy losses.

Silver Brook mine covering an area of 7½ square miles and containing several beds of coal, aggregating 22 ft. in thickness, which have never been touched, may be opened by the Lehigh Valley Coal Co. The property which was leased to the J. F. Wentz Coal Co., of Philadelphia, was abandoned and filled with water in 1906. It is stated that the coal deposits have been merely scratched and the resumption of operation will mean the employment of 1500 men.

Harrisburg—It is stated that the action in equity involving construction of the term "miner" in the Mine Foreman's Certificate Act, is to be appealed to the Supreme Court. Judge McCarrell, of the Dauphin County Court, declined to enjoin Chief of Mines James E. Roderick from issuing certificates to men who have not served five years as actual diggers of coal, holding that the Legislature did not make that a requirement.

Wilkes-Barre—When a half dozen employees at the Henry colliery of the Lehigh Valley Coal Co. at Plains were unable to show their union buttons recently, 700 men and boys, members of the United Mine Workers of America, declared a strike, and operations at the colliery came to a standstill.

Bituminous

Uniontown—Henry Ainsley was instantly killed and Harry Capitol was severely injured, Jan. 8, when the insulation on a 550-volt wire in the Evans No. 3 mine wore off and charged an electric coal cutter. When the men started the machine, Ainsley was thrown to the floor of the mine and came in contact with the rail which had been also charged. Capitol was burned on hands and arms.

Washington—Following the settlement of the action brought by the employees against John M. Greek, president of the Greek Coal Co., operating near Washington, for failure to pay his employees their wages, it was recently announced that the mine would reopen, giving employment to about 75 men.

Connellsville—It is expected that the coke industry will shortly reflect the pronounced improvement which has already taken place in the steel trade. Connellsville coke is now showing but little change over former figures, being approximately on a basis of 200,000 tons weekly, production and shipments being about equal.

Charleroi—Announcement was recently made that the Eclipse and Alice mines of the Pittsburgh Coal Co. would be started in full shortly, giving employment to 500 to 600 men each. Various factories and mills, as well as other industrial works, some of which have been shut down for months, are resuming operations.

Fredericktown—There does not seem much chance of Vesta No. 5 mine resuming operations for some time. This mine is one of the largest along the Monongahela River and is operated by the Jones & Laughlin Co. Commissaries have been opened to relieve the suffering of the poorer families. This mine when in operation employs between 1000 and 1200 men.

Monongahela City—The local Pittsburgh Coal Co. officials have received notices that mine foremen, firebosses and other minor officers shall at once sever their connections with the so-colled "booze clubs" or resign their positions.

Martin—The Martin mine of the Republic Iron & Steel Co., which has been on fire since Nov. 4, 1914, has as yet not been drowned out, though the pumps have been almost continuously in operation.

WEST VIRGINIA

Bluefield—Many Italians are making their way to Norfolk and other seaport towns, from whence they will sail to the Old Country or go to some other part of this, where they can secure employment. It is understood that some of the coal companies in the nearby fields, are unable to give all their men work, and this is probably the reason that so many are leaving this region.

Fayetteville—One of the largest mortgages ever placed on record in this county, was filed recently. It is from the Sunday Creek Co. to the U. S. Mortgage & Trust Co. and consists of 160 pages. It is issued for the purpose of refunding indebtedness represented by unpaid bonds, amounting to $3,838,000, issued in April 1910. Interest unpaid on these bonds amounts to $95,950 and the amount of the new bonds issued is $3,934,000. The bonds are to run 34 years at 4% interest. Coal lands and property in Ohio and West Virginia are covered by this issue.

Charleston—Advance pages of the biennial report of Earl A. Henry, chief of the Department of Mines, show that the production of coal in West Virginia, for the fiscal year ending June 30 last was the greatest in the history of the state. From 1005 mines in 33 counties there were produced during the year 65,783,088 tons of coal, as compared with 61,770,352 tons for the previous year. McDowell County led in production, although the output there showed a decrease from preceding years.

Huntington—The Lorain Dock & Coal Co., which has heretofore been one of the largest operators in the eastern Ohio field, announces the purchase of 14,000 acres of coal land in Logan County, which it intends to begin work upon at once. Reports vary as to the company's plans with reference to its eastern Ohio properties, J. W. Johnson, general manager, being quoted as saying that the company will not permit them to remain idle any longer than necessary by reason of the labor trouble, while it has several times been declared that the company will remove all equipment possible to its new West Virginia properties. In connection with the latter report, it is stated that the company will lease its Wheeling Creek and Lansing mines to the Youghiogheny & Ohio Coal Co., which owns adjoining properties, and which will operate the mines named from its own openings.

VIRGINIA

Bristol—With apparent prospects for a revival in the industrial world, there are evidences of renewed activity in the Virginia and Kentucky coalfields. In eastern Kentucky, the mining plants of the Consolidation Coal Co. and the Elkhorn Mining Corporation working in the field contiguous to the Virginia line are resuming operations, and it is expected that all the mines in that region will be in full operation within the next month or thereabouts. Hundreds of men have been added to the mining forces, and the number will be largely increased. It is said that already the railroads are realizing a large increase in the coal tonnage.

TENNESSEE

Jellico—The East Tennessee Coal Co., which a few months ago started a coal development at Lothair, in Perry County, Ky., announces that it will begin shipping coal Jan. 20. This new plant is one of the largest in the Perry County field. A connection with the Louisville & Nashville main line has just been completed, and put in operation. Several hundred men are being given employment.

Knoxville—The annual meeting of the Southern Appalachian Coal Operators' Association will probably be held on Feb. 2, according to announcement made here. At this meeting the election of officers will be the principal matter of business. Knoxville operators report that mines in this part of the state are under way again and that the recent cold weather greatly reduced the retail stocks on hand in this section. Business conditions are improving and the general tone of the market, it is said, is much better than it was 30 days ago.

KENTUCKY

Williamsburg—The Watts Creek Coal Co., operating mines at Woffard, Ky., north of here, has been sold to W. L. Moore, a local capitalist, for $4205. Mr. Moore will reorganize the company, which has been in the receiver's hands for some time and which was sold by the country commissioner, and expects to begin operating on the first of February.

Greenville—Charging that he was the victim of an unprovoked attack by employees of the Bevier Coal Co., and that he suffered 50 gunshot wounds in the side and back, Will Vance, himself under indictment for alleged participation in a "possum hunter" raid, has sued the coal company and a number of its employees for $5000 as damages. One of the defendants is J. P. Cox, who, as leader of a group of the company's employees, returned the fire of the raiders who attacked the company's store in which they were barricaded.

Frankfort—Some hope is expressed by interests which favored the Kentucky Workmen's Compensation law, that the Court of Appeals may reconsider its finding in that case. This hope is based only on the grant by the court of an additional 20 days in which the attorney general of the state may file his petition for a rehearing or modification of the court's opinion in the case. Three members of the court, one of them now chief justice, held in a dissenting opinion that the law was constitutional although the majority of the court ruled otherwise.

Harlan—The Haggin interests of Lexington and New York have bought a one-fourth interest in the Asher Coal Mining Co. of this section. The company's capital stock is $2,000,000 and the Haggin interests are reported to have paid $500,000 for their share. Judge T. J. Asher retains the remaining three-fourths. The company controls all the Asher land in Harlan and Bell counties, several thousand acres.

OHIO

Cleveland—Eastern Ohio coal operators, at a meeting recently held here, decided to open their mines under the open shop plan. Striking miners who have been idle since Apr. 1 last will have first opportunity under the scale offered by the operators. Notices that the mines in Belmont, Jefferson and Harrison counties will resume on a date to be selected later will be posted at virtually all of the operations in the eastern Ohio field. Should the strikers refuse the rate offered, they will be served with notices to vacate the coal companies' houses, failing in which eviction proceedings will be started.

Martins Ferry—Upon the settlement of the coal strike in eastern Ohio depends the opening of a mine in Jefferson county, which has been closed down for the past 7 years. This is the Royal Coal Co.'s mine located at Tarrs Run. It is stated that should the strike be settled, this mine would reopen immediately, giving employment to at least 400 men.

Carbon Hill—A new mine will be opened in the vicinity of Carbon Hill, Ohio, by interests from Nelsonville. It is planned to give employment to 50 men. Willis Ross and George Ridenhour are in charge of the project.

Marietta—A vein of coal has been opened on the William Covey farm located near the county infirmary of Washington County. The vein is 3½ ft. thick of good quality.

Columbus—The United States Supreme Court rendered a decision recently upholding the constitutionality of the Ohio workmen's compensation law. This measure was enacted several years ago and had been fought by certain interests. The decision upholds the right to classify employees with the provision that the operation of the law is to be limited to employers working more than five persons.

ILLINOIS

Marion—The axle or shaft on the top of the tipple, of the Big Muddy Fuel Co.'s mine, near here, recently broke squarely in two while the cages were midway between the bottom and the surface. Fortunately, no miners were in them, and when they went to the bottom no one was injured. The cables, in going down, tore away part of the upper portion of the tipple, necessitating a suspension of several days.

Danville—What is considered as remarkable among medical men is the case of Frank Partari, a coal miner, who suffered a broken back in a mine accident at the Carrier Mills, Saline County, more than a year ago, and who died on Jan. 2, at St. Elizabeth's Hospital here. He suffered absolutely no pain until the final week. This case attracted considerable attention in the medical world.

Harrisburg—Officials of the State Mine Rescue Commission have perfected plans for a rescue station here. This follows closely on the establishment of a relief or substation at Herrin.

Chicago—The Illinois Coal Operators' Association recently appointed a committee to consider methods of standardizing the sizes of bituminous coal to be mined and sold in the state. At the present time there are five sizes in common use. Operators in Indiana, Ohio, Pennsylvania, West Virginia and Kentucky have advocated the adoption of standard sizes for coal.

Willisville—The Willisville coal mines south of Sparta have reopened. These mines employ about 300 men and shut-down several weeks ago, when a race riot broke out and two Americans and two Italians were killed. In the reopening, both Americans and Italians got their old jobs back.

ARKANSAS

Russellville—Under a decree of the Chancery Court the property and lease of the Arkansas Anthracite Coal Mining Co. have been sold to satisfy a judgment for $16,500, rendered against the operators in favor of W. F. McBride, a miner who was injured while digging coal in the mines in March, 1913. The property was sold to the plaintiff who transferred his lease to the Southern Anthracite Coal Mining Co. which will operate the property for the remaining four years of the lease.

TEXAS

Albany—Announcement has been made of the discovery of a bed of coal 5 ft. thick on the ranch of S. Webb. 6 miles northeast of Albany. An oil well was being sunk on this land and at a depth of 675 ft. coal was encountered. Investigation showed the measure to be 5 ft. in thickness. Previous attempts to locate coal have resulted only in finding strata not more than 20 in. in thickness.

COLORADO

Denver—Fearing an attack by union miners on the jail at Walsenburg, Sheriff Farr, on Jan. 9, sent an urgent call for aid to Governor Ammons and a company of 70 militiamen in command at Captain Hill were placed on guard around the jail. There were about 15 strikers in jail charged with murder, conspiracy, and other crimes as the result of mine battles last spring. It has been predicted for some time that as soon as the Federal troops left the state trouble would start. The last of the regulars departed recently.

FOREIGN NEWS

Fernie, B. C.—One man was killed and two others severely injured as the result of a recent explosion occurring in the Coal Creek mine just before the men went down in the morning. Government Inspector of Mines Evans, who went below immediately after the explosion, was overcome by gas, as were his companions, Superintendent Caulfield, and Robert Adamson. Caulfield and Adamson were revived by the use of oxygen apparatus, but Inspector Evans failed to respond to this treatment and died in the afternoon. Two men who were near the entrance of the mine when the explosion occurred were badly injured, but aside from these no one was hurt.

PERSONALS

E. B. Lewis has been made traveling sales agent of the Philadelphia & Reading Coal & Iron Co., at Toledo. He formerly represented the company at South Bend, Indiana.

J. M. Roan, chief mine inspector of Ohio, is recovering from a severe illness, in Mt. Carmel Hospital, Columbus. Recently he returned from a trip in eastern Ohio and was threatened with diphtheria.

H. G. Davis, general superintendent of district No. 4, of the Delaware, Lackawanna & Western Coal Co., including all that territory in Wyoming Valley south of Kingston, on Jan. 6, tendered his annual banquet to all mine foremen of his district, and the event proved even a happier one than any heretofore given.

P. A. Coen has resigned his position as Northern sales agent for the Rail & River Coal Co., with offices in Toledo, to accept a position as general sales manager for the Sunday Creek Co., Columbus. Mr. Coen has already gone to Columbus to assume his new duties. He is widely acquainted with the coal business both in the mining and marketing departments. He has held many prominent positions throughout the country and was in charge of the Pittsburgh Coal Co.'s exhibit at the Louisiana Purchase Exposition in St. Louis.

CONSTRUCTION NEWS

Typo, Ky.—W. R. and C. P. Pense, of Philadelphia, Penn., have leased a coal boundary on First Creek and plan to begin development work immediately. It is said that an electrically equipped plant will be installed and that a daily output of 100 tons is planned for the beginning.

Floodwood, Ohio—Howard D. Manington, in charge of the construction of the power plant at Floodwood, Ohio, says the construction work has been delayed because of inability to secure materials promptly. The first turbine will be installed in January and it is expected that it will be making current by Feb. 1. Contracts have been made to supply the current to many mines in that section as well as to cities and towns. Athens, Nelsonville, Glouster, Albany, Buchtel and Murray City will be supplied with current.

Norton, Va.—The contract for the construction of the first post office building to contain provisions for a mine rescue station has just been awarded, and the structure will be erected immediately at Jellico, Tenn., in the mining region of that state. Another such post office building is under consideration for Norton. Norton is in the same general mining district, and not far from Jellico, but on the opposite side of the mountain range. It is the plan to equip both stations with mine rescue apparatus similar to that of numerous other stations already established in the mining regions,, From these points as headquarters relief can be sent quickly to the scenes of accident.

NEW INCORPORATIONS

Philippi, W. Va.—A. T. Thompson has incorporated with a capital stock of $100,000 to develop coal mines.

Cambridge, Ohio—The Coal Run Coal Co., of Cambridge, Ohio, has filed amended articles of incorporation increasing its capitalization from $5000 to $60,000.

Cincinnati, Ohio—Papers have been filed with the secretary of state increasing the authorized capital of the Reliance Coal & Coke Co., from $100,000 to $150,000.

Booneville, Ind.—The Boone Coal Co. has been organized with a capital of $15,000 to mine and sell coal. The directors are L. T. Shaw, C. E. Doane, William T. Shaw and others.

Charleston, W. Va.—Notice of an increase in capitalization from $500,000 to $1,000,000 was recently filed with the Secretary of State by the Main Island Creek Coal Co., of Logan County.

Wilburton, Okla.—The Wilburton Coal & Mining Co., of Wilburton, has been organized with a capital stock of $1000. The incorporators are James T. Katigan, Annie Katigan, of Wilburton, and John Campbell, of Ritchie, Mo.

Charleston, W. Va.—The Imperial Coal Sales Co., of Burnwell, in Kanawha County, was recently granted incorporation papers. This company is capitalized at $5000, and the incorporators are Quinn Morton, of Brunwell, W. S. Wood, Geo. S. Couch, Jr., S. B. Richmond and Charles Rumbaugh, all of Charleston.

INDUSTRIAL NEWS

Dayton, Tenn.—It is believed that the present mine inspectors, of Tennessee will not go out of office before the first of June unless the fever of "turn the rascals out" gets extremely high. It is not thought probable that this will be the case.

Wellsville, N. Y.—The New York office of the Kerr Turbine Co. will henceforward be in charge of Benjamin G. Fernald, recently appointed district manager. The office will remain in the Singer Bldg., but will be removed to Room 108 in the annex, or No. 45 Liberty St.

Pittsburgh, Penn.—From all parts of Pennsylvania come encouraging reports of renewed industrial activity, of men returning to work, and renewed confidence on the part of capital. This is to be noted especially in the steel and coal industries, two vital branches in the state's business.

Boston, Mass.—All the floating equipment of the Consolidation Coal Co. has been taken over by the Consolidation Coastwise Co. of Massachusetts. It was decided some time ago to divorce this department from the coal company, and the new concern was formed with the parent concern the principal stockholder.

Huntington, W. Va.—Figures recently given out by the Chesapeake & Ohio R.R. show that the coal and coke loadings in West Virginia and Kentucky coal fields increased 188.2% in the last ten years. Loadings for 1914 were 22,431,445 tons or an increase of 16.9% over the previous season. It is believed that 1915 loadings will exceed these figures.

Pittsburgh, Penn.—Reports are current that negotiations have been practically completed between J. V. Thompson, of Uniontown, and interests believed to represent the United States Steel Corporation, for the sale of the major portion of 200,000 acres of coal land in Greene County, Penn. It is variously estimated that the transaction involves from 18 to 34 million dollars.

Pittsburgh, Penn.—Ten towboats were started south with coal on the Ohio River Jan. 10, the total shipment aggregating about 2,000,000 bu., or in round numbers 80,000 tons. This shipment about cleaned up the anchorages of coal in the local harbor, much of which had been tied up since the middle of last summer. Some of the towboats will turn back after getting below Wheeling.

Pittsburgh, Penn.—The total shipments of coal for 1914 from the Monongahela River mines passing through Lock No. 4 were 170,278,500 bu., or a decrease of 39,998,500 bu. from the total shipments for 1913. This decrease in shipments during the past year is attributed to low water preventing the return of boats from Southern ports in sufficient quantities to keep the mines in operation.

Morgantown, W. Va.—It has been announced by J. B. Hanford, of the Elkins Coal & Coke Co., that his firm has just closed a contract of 20 years' duration to furnish the Lehigh Coal Co., of South Bethlehem, Penn., 600,000 tons of coal annually. This contract is one of the largest ever handled by the company, and means that all the mines in this section will run on full time for years to come.

Boston, Mass.—The Darrow - Mann Co., an old house here and latterly the local factor for the Caperton interests in the New River field, has been absorbed by the New England Coal & Coke Co. The larger company will be sales agent for the same coals handled by the Darrow-Mann Co., and will also operate the sea-going tugs and the larger barges that have belonged to the Commercial Tow Boat Co., a concern that was closely allied with the Darrow-Mann Co.

Columbus, Ohio—No bids were received by receiver Charles Cohenour, of the Maple-Gallia Coal Co. when the property of the defunct firm was offered for sale at the Court House, Columbus, Jan. 9. The property, which consists of two mines in Athens and Vinton counties, was appraised at more than $36,000. The capacity is about 800 tons daily. Negotiations are now pending to sell the property at private sale and the court will be asked for instructions.

Columbus, Ohio—Of interest to the coal interests of Ohio is the announcement that all of the operating offices of the Toledo & Ohio Central, the Kanawha & Michigan and the Zanesville & Western railroads will be consolidated in Columbus. Frederick B. Sheldon, former president of the Kanawha & Michigan, has been made vice-president of the Toledo & Ohio Central and the Zanesville & Western, which are subsidiary lines to the New York Central system. The general and operating offices of the companies have in the past been located in Toledo but the lease on the offices expires in May.

Philadelphia, Penn.—The official decision of the Public Service Commission ordering a reduction of anthracite freight rates from the Pennsylvania regions to this city gives the companies until Jan. 18, or six days longer than was originally expected, in which to apply for a rehearing before the commission or make a direct appeal to the Dauphin County Court. The original tentative announcement made in the anthracite rate case bore the date of Dec. 12, 1914, and therefore it was believed to take effect Jan. 12. Copies of the final decision, however, which have been sent out by the commission within the last few days bear the date of Dec. 18.

Somerset, Penn.—According to Baltimore & Ohio railroad men there is no longer any reason to doubt that there is a genuine boom in the coal business. Many of the mines in Somerset County, which have not been operating above nominal repair work for months, are now on full time and considering the advisability of putting on extra shifts to keep up with their orders. The Somerset transfer yards for the past week have been jammed with loaded coal cars going out and with empties coming in. The coal is going east to Tidewater, west to the Mississippi and north to Canada. Some of the orders are said to be for European fleets.

Coal Trade Reviews

General Review

Anthracite under heavy pressure with operations rigidly curtailed. Bituminous steady and showing occasional gains. Stocks reduced by the holiday curtailment. Urgent business in the Middle West.

Anthracite mining has slowed up appreciably under the influence of the milder weather, and the trade is distinctly flat, with a marked tendency toward heaviness. Most of the large companies are cutting down running schedules, and those continuing on a full-time basis are only doing so in order to accumulate a surplus against some possibly severe weather and a consequent slow movement. The market is entirely lacking the customary midwinter snap.

The Eastern bituminous agencies report a very slight improvement, which is due to a restriction in operations rather than any increased demand. The surplus tonnages at Tidewater seem to be substantially reduced as a result of the curtailed output over the holiday period, and there is no pressure to move demurrage coal. Even though this change for the better be scarcely perceptible, sales agencies are showing a greater confidence in preliminary negotiations on new contracts, while spot prices are slightly firmer. It is highly probably that the abnormal vessel rates will cause such an irregular movement in the Coastwise trade that the market may be subject to more or less violent fluctuations.

The marked improvement noted in the Middle Western field for the past several weeks has reached to the Pittsburgh district, where the industrial demand is decidedly better, though still substantially below normal. There has been considerable coal taken off the spot market, while operations are slightly heavier and show indications of a sharp increase. While nothing in the nature of a boom is anticipated, it is thought in all quarters that there will be a gradual and strong improvement along conservative lines from now on.

The improvement in Ohio is confined more particularly to railroad buying, and has not attained to large proportions. In domestic circles the approach of spring is already becoming a feature in the situation, and dealers are showing a tendency to be more conservative regarding their purchases in order to avoid the possibility of carrying over any large surpluses. What few contracts have come up have been closed at last year's figures. The Southern market is obviously overstocked and has failed utterly to respond to the improved conditions noted in other directions. Domestic consumers are not buying to the extent anticipated, and dealers are restricting their orders to the minimum.

With the exception of occasional spots where the effects of the warmer weather are being felt, the Middle Western market continues to broaden out in a most satisfactory manner. Numerous orders have been placed for rush shipments, while certain sizes have shown an unexpected strength, and price advances have met with no resistance, but apparently created a heavier buying movement. The railroads seem to be coming into the market stronger, and spot prices are in some instances higher than contract quotations for the first time in a long period.

ATLANTIC SEABOARD

BOSTON

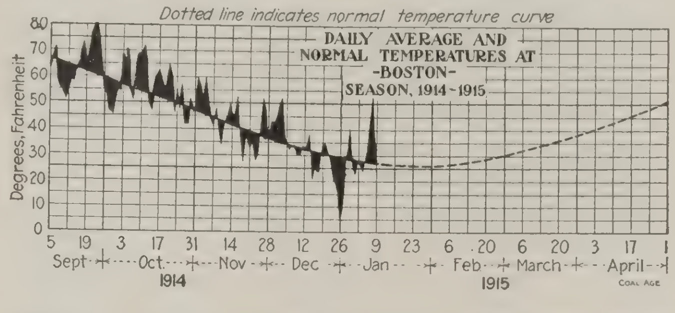
Improvement continues but very slowly. The mild spell slows up the buying and prices on Pocahontas and New River are practically without change. Receipts here still light on account of slow movement of transportation.

Bituminous—While there is undoubtedly an improvement in the situation on Hampton Roads coals, the progress is very slow. It is the restriction of output, however, and not an enarged market that causes the improvement. The expected renewal of inquiry off-shore has not at yet developed into any proportions and it is still a hand-to-mouth market in New England. Contract demand is generally better because of recent interruptions to shipping. Preliminary talk on contracts he coming season shows more confidence on the part of the ales agencies than a month ago; current views of the probable state of prices are a notch higher than was the case then.

The spot market, on the other hand, is very little firmer than in November and December; $2.70 is about the upset price for the favorably known grades f.o.b. the Virginia terminals, the price at which the Panama Railroad contract was awarded. This is a season when sales of cargo lots are very infrequent in this territory but all the shippers are pressing for orders and the feeling is general that prices would be made to suit the buyer who happened to be in the market. The number of such, however, is very small.

The surplus of coal at all the distributing points is rather less than has lately been the rule. "Market cargoes" are less frequent and prices more even; $3.68 is still the minimum price f.o.b. Boston but with trade rather slow.

Georges Creek demand is still constant, the shippers being well supplied with business. In order to get forward coal in sufficient volume a number of sailing vessels and outside barges were chartered to make up for light receipts due to bad weather along the coast a fortnight ago.



The choicer Pennsylvania coals enjoy a fair business on the basis of restricted output but the ordinary grades are rather druggy. There seems nothing better in sight until Hampton Roads shippers get higher prices.

Anthracite—Orders are beginning to come in freely now to most of the wholesalers. Retail trade is good in all directions. All sizes are in good supply and the only delay in loading has been due to weather interruption in the movement of boats.

Prices on bituminous at wholesale are about as follows:

	Clearfields	Cambrias Somersets	Georges Creek	Pocahontas New River
Mines*	$0.90@1.50	$1.15@1.65	$1.67@1.77	
Philadelphia*	2.15@2.75	2.40@2.90	2.92@3.02	
New York*	2.45@3.00	2.70@3.20	3.22@3.32	
Baltimore*	....	....	2.85@2.95	
Hampton Roads*	....	....	....	$2.60@2.75
Boston†	....	....	....	3.68@3.78
Providence†	....	....	....	3.63@3.73

* F.o.b. †On cars.

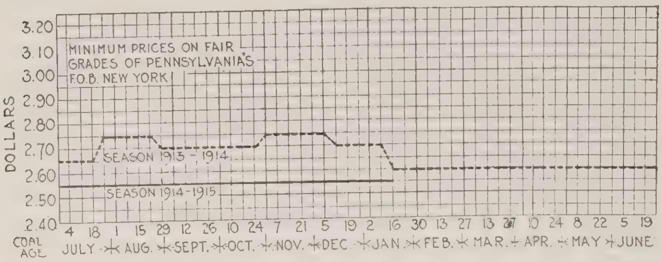
NEW YORK

Bituminous still marking time though stocks are somewhat reduced as a result of the curtailed operations over the holidays. Heavy reduction in working schedules the feature of the anthracite trade.

Bituminous—As a result of the curtailed operations in the bituminous fields over the holidays, stocks are somewhat lighter and the operators continue cheerful over the outlook. Some operators report the December tonnage as the best they have had for a long time, one large company in particular claiming it to be their heaviest month since March. Current operations also seem to be slightly increased. Occasional odd tonnages are still heard of on demurrage, but there is no general pressure on consignment coal.

The continued advance in vessel rates is creating much interest in the trade. If the situation becomes much tighter in this respect, the difficulty in obtaining vessel tonnage will make the movement irregular and must inevitably result in a fluctuating market. There is nothing much of interest developed so far, on new contracts, but the outlook is not at present regarded as favorable. At no time since last April has the spot market been at a higher level than contract figures, and it is clear that buyers will be conservative about new contracts. Any advances are, of course, not being considered, but, on the other hand, the agencies will make a determined fight for the same prices as last year, though concessions will no doubt be necessary.

The New York market is quotable on the same basis as follows: West Virginia steam, $2.35@2.55; fair grades, Pennsylvania, $2.55@2.65; good grades of Pennsylvania, $2.70@2.80; best Miller Pennsylvania, $3.10@3.15; Georges Creek, $3.15@3.25.



Anthracite—The return of more moderate temperatures has caused a slowing up in the hard-coal trade. At this time the market is more or less controlled by weather conditions, and prices fluctuate accordingly. The situation was so slow last week, that the Reading Co. reduced operations to only three days, other companies curtailing likewise, though not to such an extent. A few of the companies are producing in excess of the market requirements in anticipation of a heavier demand and slower movement should the weather become severe as is liable to be the case at this time.

The steam sizes are in fairly good demand, especially the higher grades, while pea coal is rather short. Chestnut is in good demand, with shipments slow in the line trade, but prompt at Tidewater where the companies are drawing on their storage supplies. There is not much individual nut coal in evidence. Stove coal is bringing the full circular, and the demand and supply are about equally balanced.

The New York hard-coal market is now quotable on the following basis:

	Upper Ports		Lower Ports	
	Circular	Individual	Circular	Individual
Broken	$5.10	$4.60@5.10	$5.05	$4.55@5.05
Egg	5.35	5.00@5.35	5.30	4.80@5.30
Stove	5.35	5.25@5.35	5.30	5.20@5.30
Chestnut	5.60	5.45@5.60	5.55	5.40@5.55
Pea	3.55	3.45@3.55	3.50	3.35@3.50
Buckwheat	2.80	2.50@2.80	2.50@2.75	2.15@2.75
Rice	2.30	2.20@2.30	2.00@2.25	1.35@2.25
Barley	1.80	1.60@1.80	1.75	1.25@1.75

PHILADELPHIA

Anthracite trade continues to lack tone. Curtailed operations still effective. All sizes in easy supply. No immediate improvement noted in bituminous, although prospects look better.

Anthracite—The unseasonable weather of the past week has proved a further drawback to the anthracite trade. It was confidently expected that the beginning of the new year would see good business, but the weather has been against this, and partial operations at the mines have been the rule rather than the exception. Judicious distribution of the output has been necessary in order not to crowd any one point with a surplus and even with this, it is understood that considerable coal is nearly on demurrage at Tidewater. All sizes are in good supply. The market is still slow on broken, and it is understood the reduction of this to smaller sizes has been necessary, in order to provide a disposal for it. Egg is also long. There appears to be a slightly better call for pea and buckwheat; in fact, it is understood that stocks are being drawn on for the latter. The requisitions for rice are about equal to the output.

The trade as a whole requires the stimulus of cold weather, and without this, is likely to drag.

Prices at Tidewater rule about as follows:

	Circular	Individuals
Broken	$4.75	$4.50
Egg	5.00	4.75
Stove	5.00	5.00
Chestnut	5.25	5.00@5.10

BALTIMORE

Anthracite demand quite brisk, and dealers experience a general activity. Slow betterment evident in the bituminous trade. Export movement only medium, and subject to delays.

The December consumption of anthracite was quite heavy, and January is seeing a vigorous call from many quarters. The small trade is particularly bright. In the soft-coal trade there is a slow betterment, but the general business world remains cautious. The producers now have their mines generally down to a much reduced basis, and the return to full capacity operations will only be done when business of a favorable nature develops.

Spot business generally is about fair. Some of the better Pennsylvania coals showed up a little stronger the past week, sales to the trade at the mines being made around $1.35. Lower grades ranged from 95c. to $1.10 or $1.15. In West Virginia the demand remains poor for gas three-quarter with the price around 90c. The export movement continues about medium. A few charters are being announced, principally to Cuban ports. The fact that the allied navies continue to stop many vessels at sea has caused several delays in the reporting of steamers destined for the foreign coal trade.

HAMPTON ROADS

Movement for week fair. Government taking coal by colliers and barge schooners going into the export trade.

The movement from Tidewater for the week was about the average. Some large cargoes have moved to New England and there has been some coal taken by the government. The export and bunker movements have not been so heavy as at times during last month; however, the dumpings for the first ten days of the month they will run considerably in excess of those for the same time during December.

Prices remain at circular with a poor demand for spot coal. The accumulation at Tidewater is somewhat lower than it has been for some weeks, although there is ample on hand to take care of any call that may be made.

A number of the coastwise steamers which have been trading from Hampton Roads are now in the foreign trade and barges and sailing vessels are taking their places in the coastwise business. Schooners are also being pressed into the export coal trade, two of them having been loaded during the week, one for Porto Rico and another for Rio de Janeiro.

OCEAN CHARTERS

Coal charters have been reported by the "Journal of Commerce" as follows:

Vessel	Nationality	From	To	Tons	Rate
Edward H. Cole		Norfolk	Rio Janeiro	1395	$5.25
Kenwood		Baltimore	Cienfuegos	797	
Blackheath	British	Baltimore	Alexandria	2978	7.40
Ubbergen	Dutch	Baltimore	Preston and Banes	1150	
Thomas F. Pollard		Baltimore	Texas City	617	1.15
Hugh Kelly		Baltimore	Texas City	698	
Josephine		Baltimore	Galveston	842	
Angiolina	Italian	Baltimore	Italy	2262	

Note—Steamers are indicated by **bold face** type, all others being schooners.

OCEAN FREIGHTS

Rates continue at previous high levels and there are no indications of any immediate relief.

A steamer was chartered during the past week for case oil, from here to Brazil, at equivalent to $9.60 on coal, and steamers are now offering for coal, from north of Hatteras to Buenos Aires or Rio at $9, and intimating that they will accept less. A large steamer was recently chartered for coals to Alexandria at $10.80 and steamers are offered at $9.60 to the West Coast of Italy. Freight market conditions are practically the same as a week ago. We would quote freight rates on coal by steamer as follows:

To	Rate	To	Rate
Havana*	$2.00	Guantanamo	$2.50@2.7
Cardenas or Sagua*	2.50	Demerara*	4.50
Cienfuegos*	2.50	Bermuda	2.40@2.5
Port of Spain, Trinidad	2.75@3.00	Vera Cruz*	2.50
St. Lucia	2.50@3.00	Tampico*	2.50
St. Thomas*	2.50	Rio*	8.40
Barbados	2.75@3.00	Montevideo, Buenos Aires or La Plata*	7.20@8.4
Kingston*†	2.50	Mediterranean	9.60
Curacao	2.25@2.50		
Santiago	2.50@2.75		

*About. †Small boats to Kingston $2.50@2.75. W. W. Battie & Co.'s Coa Trade Freight Report.

BUFFALO

Slow improvement in bituminous, but trade is very hopeful Manufacturers increasing operations. Anthracite continue rather dull.

Bituminous—There is a slow but steady improvement al along the line, which is expected to continue, but is not likel to develop into a boom. Shippers say that they get a goo day or two occasionally, which is the usual way that an in creasing trade manifests itself. At this rate prices will advance slowly, but there is some profit now and the increase volume will help materially.

The feeling in railroad circles is good and there is mor buying from that source than for a long time. As a rul railroad men state that they are expecting a good year, an if they do it will help the coal business.

The coal movement is steady. Nobody complains of de murrage charges and the snow and severe weather have n in any way interrupted deliveries. If there is no new di turbance in the situation there will be a good volume of bus ness doing in a month or two. The market is a little strong week by week, on the former basis of $2.80 for best Pittsburg lump, $2.70 for three-quarter, $2.55 for mine-run and $2. for slack. Allegheny Valley sizes are 25c. lower than Pitt burgh, with slack on a par with it.

Anthracite—The market is good at retail but shippers do not find it as active as formerly, though it is reported that sales from the Upper-Lake docks are good. The influence of the heavy summer sales is still felt and this may last all winter. The weather is not as cold as formerly, but the consumption to date has been decidedly greater than in any former winter for a long time. The disappearance of most of the snow has left the streets an almost solid sheet of ice, making it almost impossible to deliver anything with horses, but the automobile truck moves as readily as usual.

Loading cargoes for winter storage in the harbor has ceased for the time. There are ten large cargoes in the winter list, but the supply of coal to be handled in that way is short. It is likely that the trestles will again become active before spring, as it is desirable to put a good amount afloat in order to begin the shipping season as usual with a strong movement.

OHIO VALLEY

PITTSBURGH

Some new demand and increased requirements against contracts. Mines working at over 50% of capacity. Prices less irregular.

The demand for coal has continued to improve. For domestic purposes there is somewhat better call, while for industrial uses the demand is very decidedly improved, though it is still far below the average or normal. The increased industrial requirements do not reflect directly in the market for the reason that they apply almost wholly to shipments under regular contracts, but by giving the mining companies better shipments they decrease somewhat the insistence with which free coal is offered in the spot market. This week the coal mines of the Pittsburgh district are operating at 50% of capacity or more, and prospects are that there will be a further increase. There is now no question that the low point in operations was passed a few weeks ago, when the rate was less than 40%.

There has been a limited amount of contracting for the calendar year, in connection with inquiries that have been coming out as noted in the last report, but not a great deal, since the bulk of the contract tonnage runs to Apr. 1. The market for slack shows still more firmness, and many producers are holding out for $1 on prompt lots, though contracts are made at 90c. when running over the twelvemonth, and sometimes at a shade less. In mine-run and screened coal there is less irregularity and the market now has a semblance of steadiness on the basis of $1.15 for mine-run, the usual asking price on contracts being $1.20. We quote prompt coal as follows: Slack, 90c.@$1; nut and slack, $1.05; nut, $1.10; mine-run, $1.15; ¾-in., $1.25; 1¼-in., $1.35, per net ton at mine, Pittsburgh district.

TOLEDO

Toledo a weather market. Ohio operators to open mines under open-shop policy. Many leaving the state altogether.

The local coal situation remains practically unchanged. Conditions are regulated almost entirely by the weather, which has not been wholly favorable. There has been a hange in prices and some weakness is being shown in certain grades. Fine coal is a trifle stronger, but this is due to the act that slow production is bringing about a shortage in hese grades. Coal men here are optimistic and point to the mprovement among the railroads since the rate increase as ndicating that business is bound to be better a little later on. Local dealers will not be particularly affected by the mining ituation in Ohio. Those operators who have not concluded to leave the state altogether are going to reopen their mines nder the open-shop policy.

COLUMBUS

Steady business is reported in domestic lines. Prices are generally well maintained and a better feeling is evident in most localities. The steam business still slow. Production ight.

The coal trade in Ohio has been progressing steadily during the past week. Domestic trade is fair and orders are coming in better. Slowness still characterizes the steam trade. The tone of the market is a little better and most of the coal men are united in saying that future prospects are brighter.

Domestic sizes are about holding their own in the local trade. Dealers' stocks ran down to a pretty low point during the holiday and inventory periods and as a result the demand is better. There is a fairly good demand for West Virginia plints and Pocahontas. Anthracite is also moving fairly well. Retail prices are steady at the levels which have prevailed or several weeks.

Production has not increased materially although more steadiness is reported in most fields. The Hocking Valley produced about 65% of the usual amount and the same in the Crooksville, Jackson and Cambridge districts. The Pomeroy Bend field is producing about 80% of the average.

Strength is still shown in the small sizes. This is due to the continued low production of lump and the closing of the Lake trade. Nut, pea and slack is sold at 60 to 70c. and coarse slack is about 10c. less.

Prices in the Ohio fields are:

	Hocking Valley	Pomeroy	Kanawha
Rescreened lump	$1.50	$1.60	....
Inch and a quarter	1.45	1.50	$1.45
Three-quarter inch	1.35	1.40	1.35
Nut	1.15	1.25	1.15
Mine-run	1.10	1.15	1.10
Nut, pea and slack	0.65	0.75	0.60
Coarse slack	0.55	0.65	0.50

CLEVELAND

Warm weather and a large amount of coal have kept the market heavy. Consignment coal coming in and having an adverse effect.

Fine coals are being sold at $1.70 to $1.75 with a more liberal supply than is necessary for the demand. Brokers and operators are putting as much coal in on contracts as the consumers can stand. This has had a bracing effect, but the cost of the coal is so near the selling price there is no chance to cut quotations.

Some three-quarter West Virginia No. 8 is coming into the market on consignment and prices range as low as $1.95 on track here with $2.05 the top. There is little demand for coarse coal anywhere. The warm weather has reduced the retail demand and the trade has not had to buy more than a car or two to keep stocks up.

CINCINNATI

Slower buying due to usual slowing up at the beginning of the new year. General conditions fair and improvement is considered certain.

Business has been rather dull, due to the usual new year slowing up. The weather has been all that could be asked by the trade, but buying has been in relatively small volume. On domestic coal this seems to be due to the lateness of the season.

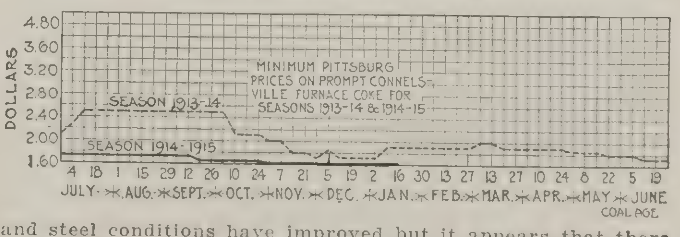
As heretofore reported, stocks were heavily drawn upon during the severe weather of December, but now that a new year has begun, most of the retail trade seems to be determined not to stock any considerable supply. The remarkably good transportation conditions have been a real handicap to business, as it has been possible at all times for retailers to secure supplies immediately on demand. If this were not the case stocking would undoubtedly be more liberal. Prices have been maintained at a fair level, as a rule, save in the comparatively few cases where distress coal has been thrown on the market.

COKE

CONNELLSVILLE

Coke market stagnant, contracts being closed and further activity awaiting the blowing in of additional blast furnaces. Production and shipments slightly decreased.

The coke market is decidedly quiet, as it has been since the contracting movement slowed up just before the holidays. Here and there negotiations have been in progress on small lots for various periods, but in general the market is stagnant, awaiting a fresh demand through the blowing in of additional blast furnaces. Of this there is no immediate prospect. Iron and steel conditions have improved but it appears that there was an excess of production when demand for iron and steel was at its lowest. There have been occasional purchases of prompt furnace coke, and a little prompt foundry coke is moving all the time. The market is quotable as follows: prompt furnace, $1.60; contract furnace, $1.75; prompt foundry, $2@2.20; contract foundry, $2.15@2.25, per net ton at ovens.



The "Courier" reports production in the Connellsville and lower Connellsville region in the week ended Jan. 2 at 202,497 tons, a decrease of 5633 tons, and shipments at 201,712 tons, a decrease of 5568 tons.

BUFFALO

Coke is moving much as before, with prices still at the bottom. This is not much confirmation of the general belief that business is better and will resume its old activity. There are reports of iron orders given and furnaces running stronger, but they can hardly do a much increased business till there is more demand for coke. Prices continue to rule quiet on the basis of $4.25 for best 72-hr. Connellsville foundry and $3.30 for stock coke.

CLEVELAND

For several weeks coke has been low and the demand small, but the trade is taking it in much larger quantities than heretofore, and the prices are firmer than they have been. This fuel goes to foundries and the trade that is supplied by foundries is a good criterion of the business improvement.

COLUMBUS

There is a better demand for coke in Columbus and central Ohio territory. Shipments are coming in regularly from Pennsylvania.

CHICAGO

Increased inquiries are noted for furnace and foundry coke to be taken under contracts for the first-half of the year. Very few contracts have been executed, and the presumption is that producers do not wish to commit themselves at this time. Prices are as follows: Byproduct, $4.75@5; Connellsville, $4.75@4.90; Wise County 72-hr. (select), $4.75; gas coke, $4.25@4.35.

THE STEEL INDUSTRY

Situation unchanged though operations are very slightly increased. Rail purchases continue light.

Steel works are increasing slightly their rate of operations and for this week a number of large companies are running at 40 to 50% capacity. The Steel Corporation's percentage is 45 and it may be able to increase this shortly to 50, as specifications are rather better.

Taking the trade through, the first half of January has brought no new turn. The railroads naturally require some time to canvass and finance their needs and have so indicated in response to intimations that early and very considerable buying was now expected from them.

It is not decided how much of the 150,000 tons the Pennsylvania Railroad has definitely decided to buy will be given out this month. The New York Central has placed a part of the 40,000 tons on which it asked prices on Jan. 4. The New Haven is to buy 18,000 tons and the Boston & Maine 15,000 tons. Western roads have given little sign of their probable wants. —"The Iron Age."

SOUTHERN

LOUISVILLE

Market continues heavy in spite of the optimistic reports from all quarters. Dealers carrying full stocks.

In spite of reports from the mining sections to the effect that the mines are getting under way again, the Kentucky coal trade is mostly in a pessimistic frame of mind. Steam coals are undoubtedly in better demand, but there is almost no call for domestic sizes notwithstanding the fact that December was unusually cold. This means that the production of steam coals is more costly.

Though some operators are selling for such prices as they can get, quotations generally on block coals are from $1.50 up; egg coals are hardly salable at even $1, while nut and slack ranges from 35 to 75c., according to grade, all prices f.o.b. mines.

MIDDLE WESTERN

CHICAGO

Activity characterizes general market. Normal winter weather maintains prices. Demand for Western coals brisk. Good undertone in Eastern coals and anthracite strong.

Increasing strength is noted in the local market, and a tendency toward development of trade on a broadening scale.

The continued cold weather has been a considerable factor toward further improvement. There has been a better demand for domestic coal and steam sizes with prices well maintained. It was thought that the holiday period would see the usual slackening up of orders but it was quite the reverse. Chicago yards have had a busy week, and have placed numerous orders with the operators for rush shipments.

Unabated activity continues in screenings although if the demand for domestic coals presists it is not unlikely that the fine grades will soften before long. Some of the best informed agencies believe that screenings will see a general reduction of from 10c. to 15c. per ton before the end of January.

The cold weather has served to increase orders for Franklin County domestic sizes, which have shown great strength. The increased circular prices from this district have apparently only resulted in a heavier demand. A number of shipments of domestic lump have been made at $2 and screenings are still firm at around 85 cents.

Circular prices are strongly adhered to in the Springfield district. While the demand for screenings from this section has slowed down slightly, the price has not declined.

One producing company in the Carterville field has held domestic lump firm at $2, and made no shipments under that figure during the past week.

Considerable eastern Kentucky coal has been sold in this market recently at full circular prices, and the tone is strong.

Hocking grades have been doing fairly well, although several shipments of consignment coal have been sold at comparatively low levels.

Smokeless is fairly steady. There has been some price cutting by Chicago retailers, but this is not of much consequence.

The situation in anthracite is practically unchanged from last week; the market is neither strong nor weak. Chestnut is short, and egg and stove shipments about equal the demand.

Prevailing quotations are as follows:

	Franklin Co.	Springfield	Sullivan	Clinton	Carterville
Lump......	$1.75@2.00	$1.50	$1.75	$1.50@1.65	$1.75@2.00

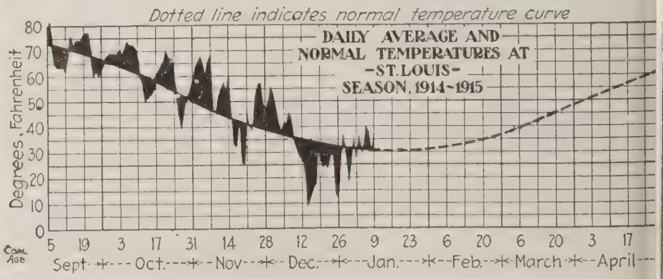
ST. LOUIS

Warmer weather has caused the market to slow up again Situation steady and will improve rapidly with lower temperatures.

The local situation is not as encouraging, as the marke has been somewhat heavy and dull on everything. Warme weather, instead of creating a better demand for steam sizes has reversed conditions, and screenings from both fields ar weakening. Washed coals from the Carterville field are i good demand; as a matter of fact, these are the only sizes tha are keeping up in price. But indications are good for col weather and there is every reason to believe that with th next touch of winter the market will be in a healthy condition.



In the Standard field there is no change to speak of, with the possible exception that some grades of Standard lump have been occasionally offered as low as 90c. With this condition existing, screenings dropped from 50 to 60c., with a promise of going to 45 or as low as 40c. Colder weather is the only hope for the Standard field right now.

Anthracite coal is not as strong as at the first of the year. There is very little demand at all for smokeless.

The prevailing prices are:

	Williamson and Franklin Co.	Big Muddy	Mt. Olive	Standard	Sparta
2-in. lump	....	....	$1.25	$0.95@1.05	$1.05@1.10

No. 5 washed nut	0.75@0 80	....	....	....	....

PORTLAND, ORE.

Milder weather again prevails and the demand is less.

The first shipment of blacksmith coal by way of the Panama Canal was made here a few days ago when the steamer "John T. Scott" arrived from Baltimore with 500 tons consigned to the Pacific Coast Coal Co. The steamer also took a shipment of coal to Seattle. A shipment of some 500 tons of anthracite from Philadelphia is due to arrive in a few days on the steamer "Cricket," which is now en route. It is said that this coal will be retailed for about $14 per ton.

FOREIGN MARKETS

GREAT BRITAIN

Shortage of supplies and prices irregular. Government cuts insurance rate.

Jan. 1—The London coal trade is largely affected by the holiday influence still, but the orders have come in freely during the week. Considerable disappointment is felt at the nonarrival of supplies. Some depots are absolutely clear of stock coal and the shortage is becoming serious. Colliery prices are irregular. Official lists are largely withdrawn.

The past week has brought forth further proof that, given adequate tonnage at reasonable rates, business could not be other than distinctly healthy. As was only to be expected, a holiday tone dominated the markets, and actual transactions were accordingly of a small character. The difficulty of obtaining supplies owing to the scarcity of wagons has developed into serious dimensions.

The United States Government has presented a protest to Great Britain, complaining of the treatment of American shipping by the British navy.

The Government rate of insurance of cargo against war risks has been reduced from 1½ guineas to 1 guinea per cent. The Colliery Guardian."

Coal Contracts Pending

Contracts listed in this department are authoritative in very respect except where the source of information is uestionable, in which event it is noted. All contracts re listed promptly on receipt and only repeated when dditional information becomes available or in the last ssue previous to the day on which bids will be closed. iberal remuneration will be paid for all legitimate otices of this kind sent in.

Contract No. 41—New York—The bids on this contract (p. 8), which provides for furnishing and delivering anthrate broken coal to the Brooklyn Bridge, were as follows: ohn F. Schmadeke, $3282; Charles D. Norton Co., $3342; Sterns ros., $3504. Address Department of Bridges, Municipal Building, Manhattan.

Contract No. 46—New York—Sealed bids will be received y the Board of Health until 10:30 a.m., Jan. 22, for furnishing d delivering white ash anthracite coal, as required, to the rious office buildings, clinics, hospitals, day camps and disinfecting stations of the Department of Health, in the different Boroughs of New York, and the tuberculosis sanatarium at Otisville, Orange County, New York. No bond will be required with the bid, but upon awarding the contract, a bond of 30% of the amount of the contract will be required. Deliveries are to be made between Jan. 1 and June 30. Blank forms and further information may be had at the office of the Chief Clerk, Department of Health, Centre and Walker Sts., Manhattan. S. S. Goldwater, M. D., is president of the board.

Contract No. 47—Batesville, Ark.—The Municipal Electric Light & Water Plant of Batesville will be in the market for 1800 tons of mine-run coal on Feb. 1. The approximate price is $3.35 per ton, and the coal is bought on a competitive basis, the usual test being the cost of evaporating 1000 lb. of water at the company's boiler plant. Address W. H. Walkup, superintendent, Batesville Water & Light Plant, Batesville, Ark.

Contract No. 48—New York—Sealed bids will be received by the Commissioner of Docks, Department of Docks and Ferries, until noon, Jan. 21, for furnishing and delivering coal. The amount of security required will be 30% of the total amount for which the contract is awarded, and deliveries are to be concluded in 90 days. Blank forms and further information may be obtained at the Department of Docks and Ferries, Pier A, foot of Battery Place, North River, Manhattan. R. A. C. Smith is Commissioner.

Contract No. 49—Harlan, Iowa—The Municipal Electric Light Plant of Harlan will be in the market for 2800 tons of coal about the first of next month. They commonly use Colfax (Iowa) steam coal, and the contract is let on a competitive basis, usually about Feb. 1. Address C. D. Lutton, superintendent, city of Harlan Light Plant, Harlan, Iowa.

Contract No. 50—Cleveland, Ohio—Sealed proposals will be received until noon Jan. 21 by the Commissioner of Purchases and Supplies for furnishing coal for the garbage reduction plant. Specifications and bid blanks may be obtained at the office of the Director of Public Service, Room 204, City Hall. A. R. Callow, Room 511, City Hall, is Commissioner of Purchases and Supplies.

CONTRACTS LET

Contract No. 28—Brooklyn, N. Y.—This contract (pp. 1009, Vol. 6, and 108, Vol. 7), which provides for furnishing and delivering anthracite coal to the various public buildings, baths, courts and comfort stations, Borough of Brooklyn, under Schedules Nos. 1, 2 and 3, has been awarded to Thomas W. Woods' Sons. Address Bureau of Public Buildings and Offices, Room 1003, No. 50 Court St., Borough of Brooklyn, New York.

Contract No. 30—New York—This contract (pp. 1009, Vol. 6, and 108, Vol. 7) has been awarded to Charles D. Norton Co., at $2.21 per thousand pounds. Address Department of Parks, Municipal Building, Manhattan.

Contract No. 35—New York—This contract (pp. 1048, Vol. 6, 108, Vol. 7), which provides for furnishing 7000 tons No. 1 buckwheat, 700 tons pea coal, 800 tons No. 1 buckwheat and 750 tons No. 1 buckwheat, has been awarded to Charles D. Norton Co. Address the Auditor, Bellevue Hospital, 400 E. 29th St., New York City.

Contract No. 36—Pittsburgh, Penn.—This contract (p. 1048, Vol. 6), which provides for furnishing the state penitentiary with its fuel supply for one year, has been awarded to the Youghiogheny Coal Co., of Pittsburgh, Penn. The grade used is nut and slack and deliveries are to be made at the rate of 20 to 35 tons per day, depending upon the season of the year. Address John Francies, Warden, Western Penitentiary of Pennsylvania, Pittsburgh, Pennsylvania.

Contract No. 37—New York—This contract (p. 1048, Vol. 6), has been awarded to the Consolidation Coal Co., Inc.; 14 Wall St., New York. The bids were as follows: For furnishing and delivering 150 tons of bituminous coal in Manhattan, $1155; for 150 tons in the Borough of Brooklyn, $1230; for 25 tons in the Borough of Richmond, $190. For furnishing and delivering 75 tons in the Borough of the Bronx, the Consolidation Coal Co. and Olin J. Stephens bid alike at $577.50, and there has been no award on this section of the contract. Address Robert Adamson, Fire Commissioner, Fire Department, 11th Floor, Municipal Building, Manhattan.

CONTRACT NOTES

The Consolidation Coal Co., Cumberland, Md., has recently received a contract to supply 60,000 tons of Fairmont 1½-in. double screened West Virginia steam coal to the Egyptian State Rys.

The Highland Creek Coal Sales Co. is reported to have received a small contract from the Egyptian State Ry. calling for 5000 tons of coal to be delivered during the months of December and January.

Financial Department

The Colorado Fuel & Iron Co.

President J. F. Welborn reports, in part*, for the year ended June 30, 1914, as follows:

Gross earnings from operation were $17,803,025.21, a reduction of $6,512,862.50 as compared with the previous year. The reduction in sales of iron and steel was $3,505,497.93 and of fuel, $3,007,364.57. Operating expenses were $16,729,255.25 and net earnings from operations $1,073,796.69, being a reduction of $2,546,496.38. Of this decrease, $1,325,176.19 occurred in the iron department and was due primarily to the general curtailment of steel business throughout the country. The decrease of $1,221,320.19 in the fuel department was caused mainly by the direct and indirect effects of the strike, though without the strike there would have been a substantial reduction in these earnings. Income from other sources was $577,477.39, making a total net income of $1,651,247.35. Bond interest, taxes, sinking funds and other charges against income amounted to $2,557,215.78, resulting in a deficit of $905,968.43.

STATEMENT OF PRODUCTION FOR YEARS ENDING JUNE 30

Short Tons—	1913–14	1912–13	1911–12	1910–11
Coal	2,428,992	4,091,667	4,038,852	4,233,756

Pig iron produced	268,883	416,467	426,659	397,701
Finished iron and steel	352,929	458,521	485,743	424,421

RESULTS FOR YEAR ENDING JUNE 30

	1913–14	1912–13	1911–12	1910–11
Iron department	$12,085,037	$15,590,535	†$15,140,523	†$13,775,664
Fuel department	5,717,988	8,725,353	†9,127,929	†9,159,021
Total gross earnings	$17,803,025	$24,315,888	$24,268,452	$22,934,685
Iron department	$1,569,288	$2,894,464	$2,766,775	†$2,502,566
Industrial dept. (fuel)	loss 495,518	725,802	†1,005,507	†975,783
Total net earnings	$1,073,770	$3,620,266	$3,772,282	$3,478,349
Add—inc. from secur.	391,229	563,439	526,270	535,672
Interest and exchange	186,248	192,190	150,423	135,927
Total net income	$1,651,247	$4,375,895	$4,448,975	$4,149,948
Deduct—				
Bond interest	$2,021,103	$2,026,780	$2,039,622	$2,091,610
Taxes	293,580	243,722	226,737	214,785
Real estate	99,221	142,531	138,317	151,263
Insurance, sociological, personal injury, etc	55,128	50,082	64,105	233,602
Equipment renewal	43,016	120,000	120,000	128,106
Loss on Col. and Wyo. Ry	....	....	....	b10,005
Loss on Crystal R. RR	36,000	36,000	36,000	36,000
Prospecting	18,168	29,588	22,965	24,904
Preferred dividends	c........	c(4) 80,000	(5) 100,000	....
Total deductions	$2,557,216	$2,728,703	$2,747,745	$2,890,276
Balance, sur. or def	df.$905,969	sr.$1,647,192	sr.$1,701,229	sr.$1,259,672

b Includes traffic contract guaranty at $25,000 per month ($300,000), less earned from traffic, as per contract for year, $289,995 in 1910-11 and $105,309 in 1908–09. c The dividend above deducted in 1912–13 is the 4% ($80,000) paid July 1, 1913; there was also declared at the same time a dividend of 4%, which was paid Jan. 1, 1914, and deducted from profit and loss. An extra payment of 35% ($700,000) was also made Mar. 20, 1913, on account of the 74% then accumulated dividends, leaving about 39% still due.

† Figures so marked are inaccurate, comparison being changed in later years, the general results for the year, however, remaining unchanged.

Virginia Iron, Coal & Coke Co.

President John B. Newton reports, in part, for the yea ended June 30, 1914, as follows:

The mines have produced 1,988,000 tons of coal at a profi of $449,775 as against 1,840,213 tons at a profit of $353,65 the preceding year.

The modern all-steel tipple at Toms Creek colliery has been completed and in every way fulfills our expectations i improved facilities for handling a steadily increasing produc tion. Further to increase the efficiency of this colliery, w are constructing a washery with a capacity for washing 200 tons of slack coal per day to wash the slack from whic your coke is manufactured, thereby improving substantiall the quality of same. We expect to complete this plant b Dec. 1.

EARNINGS FOR YEAR ENDING JUNE 30

Views of Anthracite Breaker, Wilkes-Barre, Pa.

"Do You Know Why Every User of the Barsteel Is a Booster?"

"It's because **Barsteel** locomotive features meet every coal mining demand.

"The **Barsteel** construction concentrates strength at points where there is greatest stress. Consequently, a frame **never has been broken on any locomotive in service.**

"The service record of the commutating-pole motors cannot be equalled. From a standpoint of maintenance they show better than all others.

"The large bronze motor bearings with oil and waste lubrication give better and longer service than any other kind. There are many cases where bearings have been in continuous service for three years.

"These, and the diagonally split motor frame, split gear case, open locomotive frame, and Vauclain removable gib make the Baldwin-Westinghouse **Barsteel** pre-eminent as the locomotive designed for mining work. Everything is simple, strong and easy to get at."

VOLUME 7 JANUARY 23, 1915 NUMBER 4

CONTENTS

WITH PRINCIPAL ARTICLES SUMMARIZED

*Illustrated Article

Foreword: *Page* 151

Stop! Look! Listen! Some forceful, vigorous remarks on safety in coal mining by the Safety Committee of the D., L. & W. R.R. Co.

General Discussion of the Problem, "Who Gets the Promotion?": *Pages* 152-164

Nearly 200 answers were received to the question indicated in a cartoon published recently in "Coal Age." Of all these replies, nine letters were selected by five judges as being the most interesting of the lot. "Coal Age" readers are requested to vote on these nine letters to determine the winning answer. In addition to the letters that are up for public approval, more than 20 other replies dealing with the same problem are printed.

*Contentment: *Page* 164

A poem by Michael Bernard.

Coal Production of India: *Page* 164

*The Hampton Roads Coals—II: *Pages* 165-168

A description and history of the development of the Pocahontas Flat Top field are given in this installment Particular attention is devoted to a study of the quality of different coals in the field. The uses of the fuel, transportation problems and other points are also covered. F. R. Wadleigh. COAL AGE, Vol. 7.

The Subscribers' Forum

Conducted by the Business Manager of Coal Age

Devoted to weekly discussions, interviews, etc. on the important subjects of your business and ours

THE New York Tribune has engaged Samuel H. Adams, the noted investigator, to write a series of articles on advertising and the following quotation from one of them is of special interest to us in the coal mining field.

"Honest goods honestly advertised, a dollar's worth for your dollar. Every man who has ever studied advertising will at once think of Marshall Field & Co.'s department store, in Chicago. Their advertising is *fact* advertising. There are no cataclysmic 'reductions in value;' no removal sales or 'selling out' of stock specially purchased for the purpose of selling out; no 'commercial' or 'trade' or other forms of near honesty. Other department stores there may be which maintain this standard—there are at least two in New York which come close to it—but I have as yet to examine any other general emporium advertising that can stand against rigid and detailed criticism.

"In specific lines there is much unimpeachable advertising right here in New York. To make up an arbitrary list from memory, I can recall, in years of watchfulness of the market, no deceptive advertisement by Tiffany, Gorham, Maillard, Budd, Simcox, Brooks, Crouch & Fitzgerald, Rogers Peet, Brokaw, Dunlap, Cross, Abercrombie & Fitch, Kaskel, Lucile, or Peck & Peck. Doubtless there are scores of others equally punctilious. In the national field, most of the standard watches, automobiles, candies, shaving soaps, talking machines, razors and many other lines are sold for exactly what they are on a basis of provable statement.

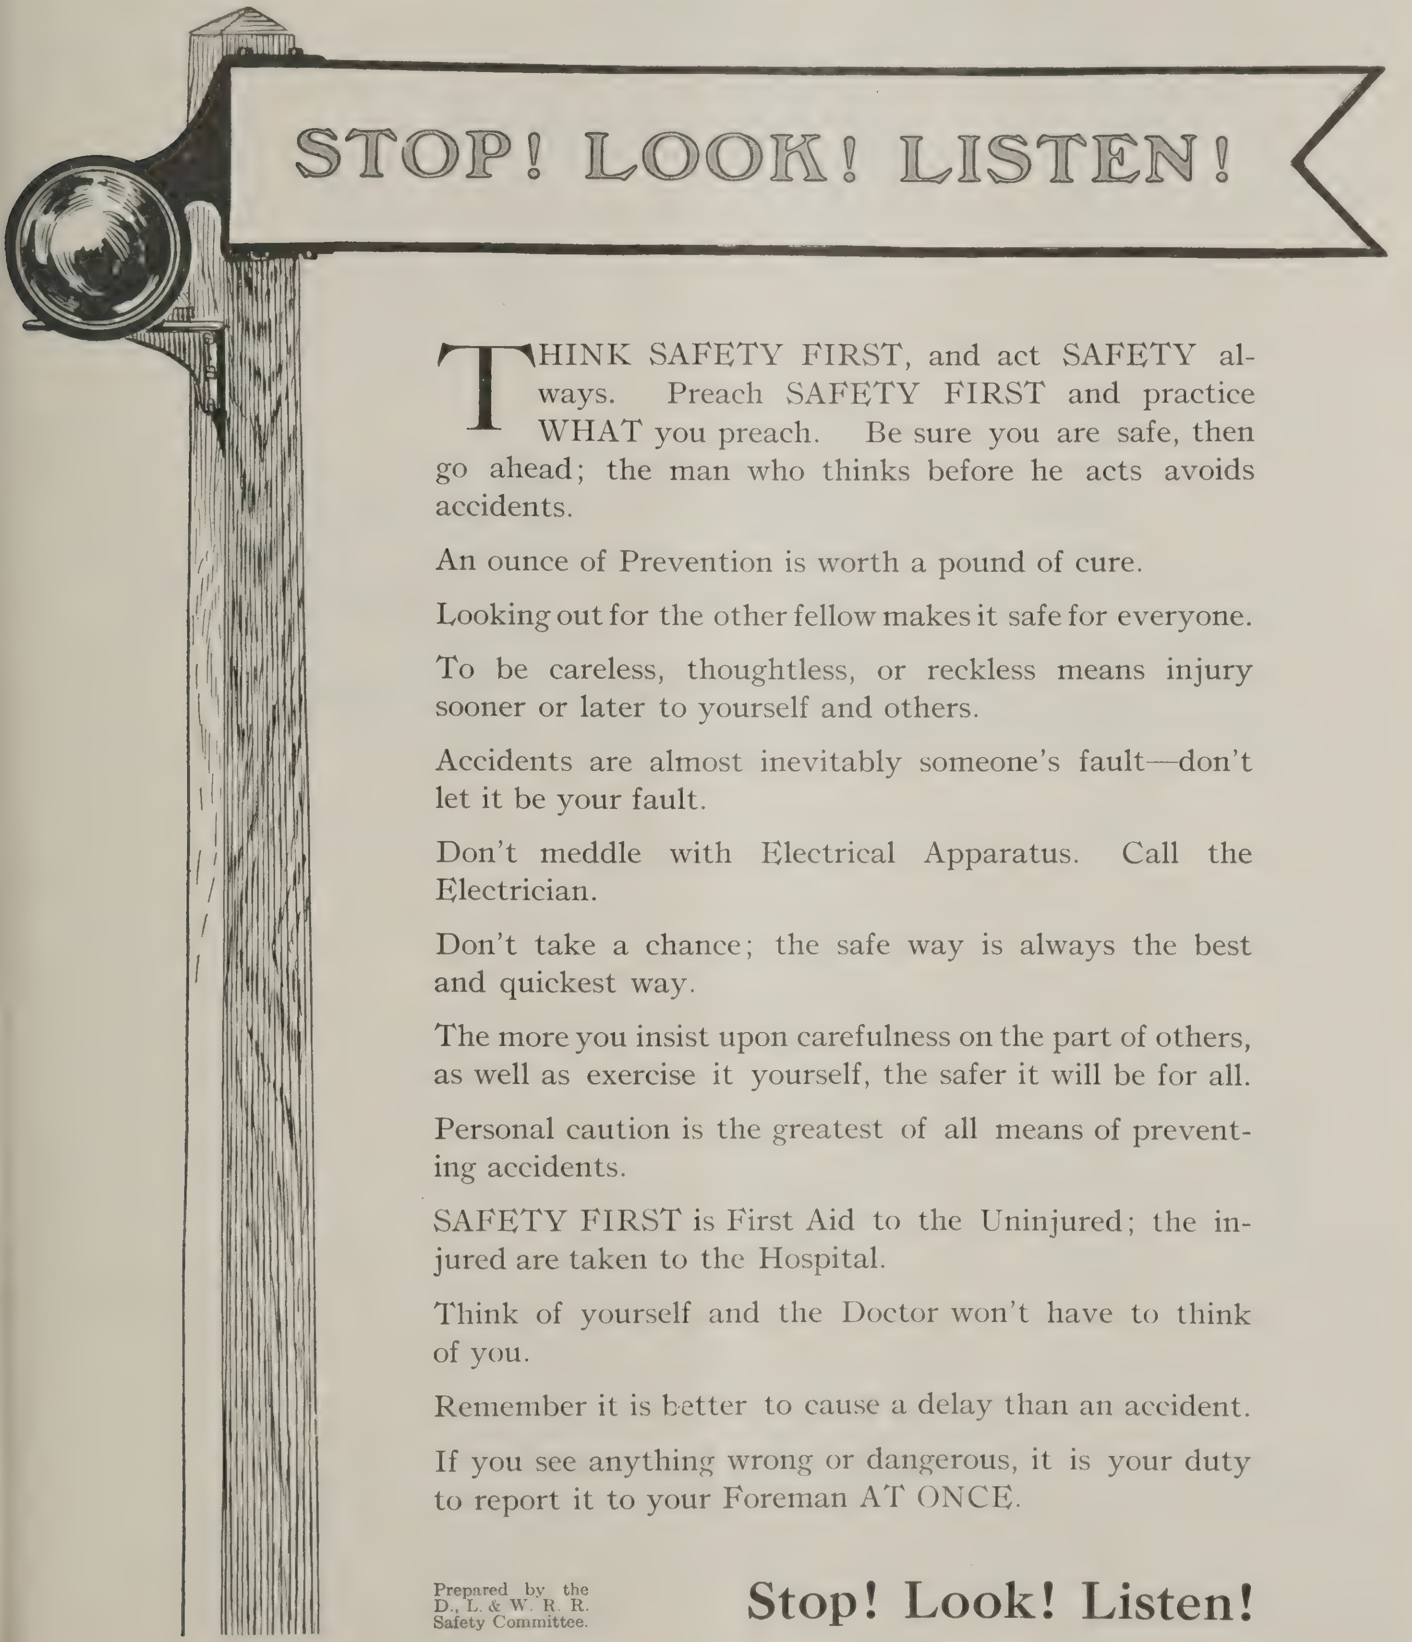
"The moral for your dollar is obvious. The most trustworthy advertising is that which confines itself either to a general statement of the nature of the merchandise offered or to description and identification of the article, with or without price stated. Goods which require the stimulus of abnormal reductions *may* be all right. Often there are real bargains arising from legitimate exigencies. But as a practicable purchasing rule, the merchant who offers you a dollar's worth for your dollar is the safest to pay your dollar to."

THE CHIEF POINT of interest to you is that the condition the Tribune is endeavoring to bring about in the newspaper field—absolute honesty in advertising—is a condition that *you* haven't had to worry about for a long time.

"Questionable advertisements," "fake claims," "exaggerated statements," "unreliable products."—We banished them all long ago and made our advertising pages a safe, profitable marketplace for everything you need to buy for your mines.

COAL AGE

Vol. 7 NEW YORK, JANUARY 23, 1915 No. 4



STOP! LOOK! LISTEN!

THINK SAFETY FIRST, and act SAFETY always. Preach SAFETY FIRST and practice WHAT you preach. Be sure you are safe, then go ahead; the man who thinks before he acts avoids accidents.

An ounce of Prevention is worth a pound of cure.

Looking out for the other fellow makes it safe for everyone.

To be careless, thoughtless, or reckless means injury sooner or later to yourself and others.

Accidents are almost inevitably someone's fault—don't let it be your fault.

Don't meddle with Electrical Apparatus. Call the Electrician.

Don't take a chance; the safe way is always the best and quickest way.

The more you insist upon carefulness on the part of others, as well as exercise it yourself, the safer it will be for all.

Personal caution is the greatest of all means of preventing accidents.

SAFETY FIRST is First Aid to the Uninjured; the injured are taken to the Hospital.

Think of yourself and the Doctor won't have to think of you.

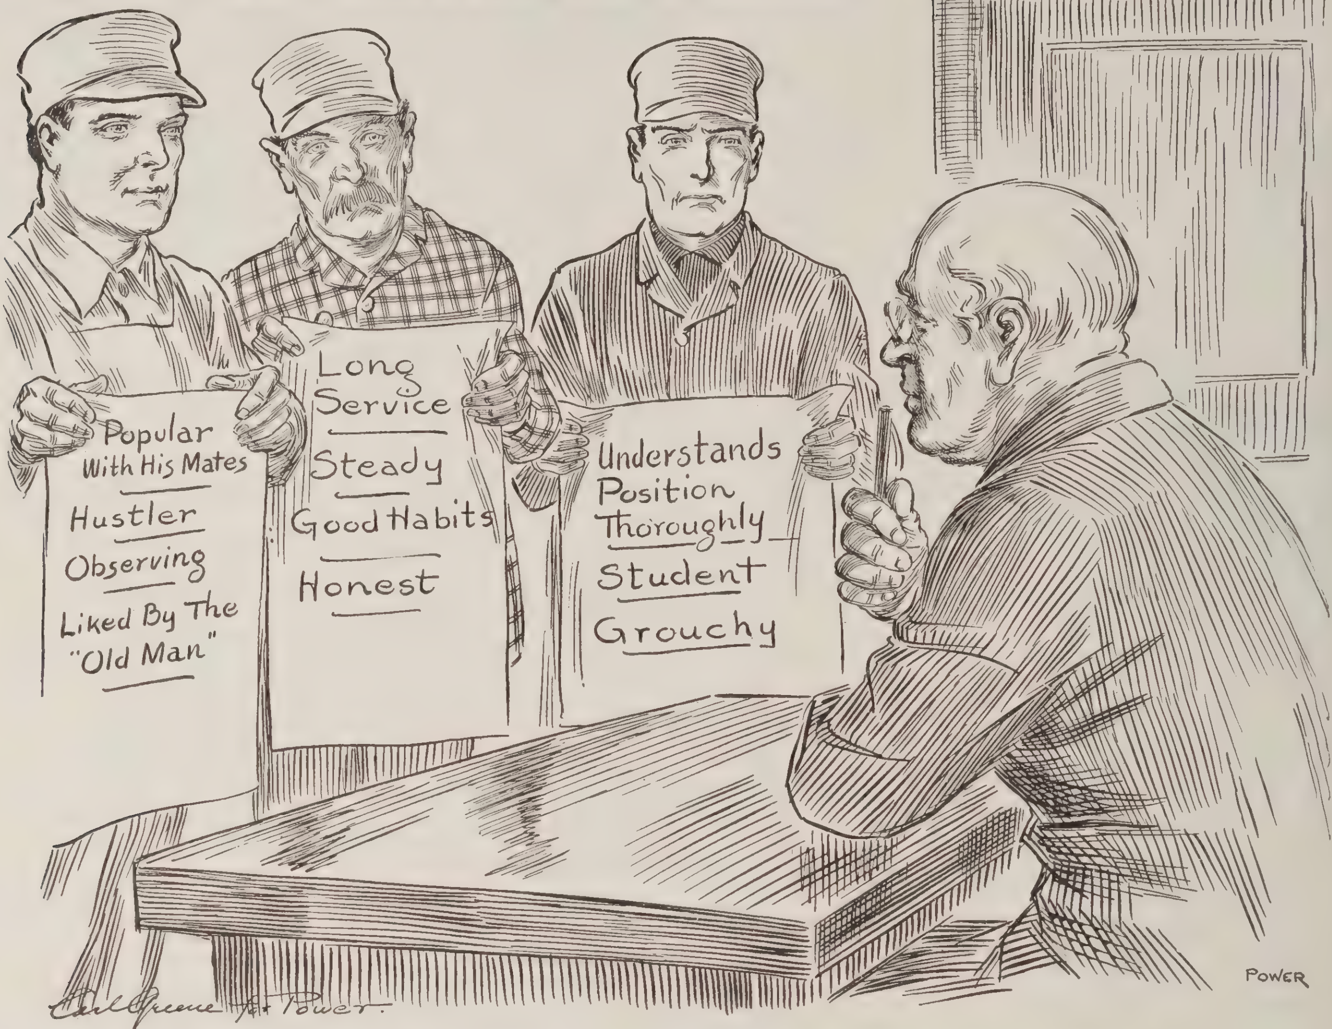
Remember it is better to cause a delay than an accident.

If you see anything wrong or dangerous, it is your duty to report it to your Foreman AT ONCE.

Prepared by the
D., L. & W. R. R.
Safety Committee.

Stop! Look! Listen!

FIVE JUDGES *were unable to agree on the winning answer to the cartoon-problem,* "WHO GETS THE PROMOTION." *It was therefore decided to let* COAL AGE *readers choose the winner. Read carefully the full particulars below and send in your selection on a postal card before February* 2. *Let us have* 10,000 *replies to this interesting question. Send your answer today.*



Who Gets the Promotion?

THE CARTOON-PROBLEM shown above was reprinted from *Power* in the Dec. 26 issue of COAL AGE. Answers to the question were invited, and the stipulation made that all replies must be in our hands before Jan. 9. Upward of 200 letters were received in response to the query.

Five judges were appointed, three of whom were editors on Hill papers. These five men selected 102 letters for careful analysis. Finally the contest narrowed down to 20 replies, and these were cut to an even dozen. But here our troubles commenced in reality, for it was evident that the problem was of such a nature that it permitted answers of great merit, although differing in choice and holding entirely divergent points of view.

The judges themselves were divided as to which man should be promoted, and this difference of opinion made a unanimous choice impossible. It was decided, therefore, to let COAL AGE readers choose the winner, and with this idea in mind, we are publishing nine letters selected by the judges as being best from the standpoints of originality and convincing arguments.

These nine letters are numbered 1 to 9, inclusive, and are not arranged in any order of merit; that is, letter No. 9 is to all intents as meritorious as letters Nos. 1 or 2. In voting, simply write a *postal card* to COAL AGE, New York City, stating the number of the letter you choose as the winner, and then sign your name. All replies must be received in this office by Feb. 2, so that the final result can be printed in COAL AGE, Feb. 6.

Let us have 10,000 replies to this interesting problem. It won't take but a minute of your time and only cost you a penny. The industry will benefit from the lessons that will be taught us all by the discussion.

There is no record of any open debate on this vital "promotion" question ever having been held before. We suggest that in all coal districts where there are mining classes, forums or institutes, the problem be discussed, for there are many men now in the employ of coal-mining companies who would thereby be awakened to opportunities at present neglected. We would be pleased to publish the results of any such discussions.

One great railroad company having heard of this cartoon-problem in COAL AGE has asked us for permission to reproduce the cartoon and publish the best answers, so as to reach all of its 30,000 employees.

If you want to have the biggest, the livest, and the most beneficial mining meeting in the history of your community, just advertise the fact that you are going to discuss the cartoon—"Who Gets the Promotion?"

The Nine Letters Selected for Popular Vote

[The following letters were selected by five judges as being the best replies out of nearly 200 answers received to the cartoon—"Who Gets the Promotion?" Note carefully the remarks on the opposite page, and send us today a postal card naming your choice of the nine letters here published. Since the discussion has exceeded all expectations, we are sure everyone will agree that it is much more satisfactory to choose the winning letter by popular vote of all Coal Age *readers. The letters here published have hardly been edited at all, and appear practically as we received them.*—Editor.]

Letter No. 1—Analyzing the qualifications of the three applicants whom we will call A, B and C, I find that A understands his position thoroughly, is a "student" and is "grouchy." Familiarity with his position is a valuable acquisition and needs no further comment. Being a student, he will perfect plans, solve problems, master details and be ready for future responsibilities. But he is grouchy—very unfortunate. Grouchiness indicates pessimism and pessimism suggests the merely commonplace in business. Grouchiness means narrow views, egotism and a lack of appreciation, suppressing hearty coöperation on the part of his helpers.

A grouch will neither have enthusiasm, nor encourage it in others, and enthusiasm is the lubricant of industry's wheels. If such a man possesses leadership it will be of the wrong kind. Discontent, leading to graver conditions, will breed under his rule.

B has "seen long service," is "steady," has "good habits" and is "honest." Long service indicates an intimate acquaintance with the mine, its possibilities and its dangers; also with the coal seam and its geological features. Being steady and of good habits, there would be no repetition of past mistakes, no radical errors, no overwhelming disasters. Ah! and he is honest, too! May one expect more?

It is not the brilliant men who succeed, but the men of character. Honesty is character's rock foundation, without which it is bound to topple. The desire to reward an old employee is uppermost. Nevertheless, he is lacking in certain requirements essential to a successful mine superintendent.

What of C? I find him to be "popular with his mates," a "hustler," "observing" and "liked by the 'old man.'" Popular with his mates, he will hold men during dull periods and attract others when tonnage is demanded. Ruling without friction or discontent, avoiding strikes and labor troubles, he will hustle sixty seconds of useful effort into every working minute, thereby producing the maximum tonnage at the minimum cost. Observing, he will stop evil tendencies, prevent accidents and ward off calamities. Being liked by the "old man" also proves him to be no narrow-minded partisan, or class favorite, but a broad-gaged, likable fellow with faith in his associates, in his employer and in himself.

Popularity is created by faith; faith gives confidence and confidence produces optimism. Altogether, they beget initiative, that quality for which the world offers its first great prizes. Also, from faith in others and confidence in self spring enthusiasm and leadership. In thought and in action he heads his procession; he sees with a clear vision; he speaks as one having authority, and he leads.

A solves problems; C grasps them intuitively by observation. B is a faithful horse, dragging his load; C is a dynamo radiating live currents.

Mining knowledge and experience; capacity and enthusiasm for the work; executive ability and leadership; these are the essential qualifications of a mine superintendent, and were I the boss I would give the office to C on points.

J. E. Butler,
Gen'l Mgr.

The Stearns Coal Co., Stearns, Ky.

Letter No. 2—Considering all the qualifications of the three applicants. I would select the man on the left. This is distinctly the age of young men, and this applicant is liked by the "old man," which indicates preferences in his favor. Being popular with his mates also will make him popular with his coöfficials and superiors.

A man who is a hustler and observing will certainly outstrip the man who has only held his position by reason of honesty, good habits and steady application. In this age of opportunity, when a man has grown old without having secured advancement from the work of a laborer to that of an official, it would seem rather risky to try him at a later stage in life, because with the constantly changing methods the younger mind is more flexible and adapts itself more readily to new conditions.

A pleasant and frank countenance is a valuable asset to any man, and for this reason I would not consider the grouchy applicant who understands his position thoroughly and is a student, because you can get more work out of subordinates by pleasant methods than by grouchy and disgruntled manners.

I frequently compare an old man placed in a new job with foreigners who come to this country at an advanced age. They show an inability to acquire a new language, and, in a similar manner, a man who is growing old can hardly be expected to adapt himself to the new ideas and working conditions which a promotion involves.

My attitude toward young men may change as I grow older, but belonging to the younger set myself, I indicate this preference.

Carl Scholz,
President.

Rock Island Coal Mining Co., Chicago, Ill.

Letter No. 3—Every mine official would do well to advance that applicant for a position who is studiously inclined and to place every reliance upon his efficiency and every confidence in his ability to grapple and surmount every obstacle. I feel assured that success would be the outcome of his promotion.

I do not desire to cast any reflections on the abilities of his two rivals in the cartoon, who, both, may be excellent men. I favor the student, however, for these reasons:

A studious man is, it is true, more or less grouchy. The application needed to master and attain superiority is severe and allows the brain no relaxation. His nervous system may naturally be as strong or even stronger than that of his competitors, but it is apt to be broken down by the demands made on it by his active mind, which is unceasingly endeavoring to meet those difficulties in his work for which usual expedients furnish no remedy and to ascertain the causes of difficulties and to prevent their recurrence by the means suggested in his keen analysis. One cannot have the favorable outcome of study without suffering somewhat from its disadvantages.

A man who makes no use of his brain power to reason or reflect for the benefit of his employer is unable to cope with the demands which his position makes upon him. His steadiness, his excellent habits and long years of service make him a methodical worker who turns out good results under normal conditions but render him as little adaptable as a machine to those unforeseen circumstances for which he has not made his experience prepare him.

The observing hustler is generally good-natured and noticed by his boss; his hustling makes him popular among his associates, and he is liked by all. But all this does not bring the efficiency which a mine official has a right to demand. The hustler has no time to ponder over the causes of troubles which arise, nor on the manner in which they can be prevented from recurring, and though his energetic nature may with keen glance overcome and smooth errors and mishaps, these obstacles will invariably return periodically, and he will meet them in the same incomplete manner.

A man who thoroughly comprehends his position also understands his responsibilities. His realization of them ever enlarges as his experience grows. His countenance may well bear some marks of the severe mental effort which the problems of the past have drawn upon it and the furrows which present difficulties are even now tracing. He not only sees the present failures, but the coming perfections, and becomes a student, often without being conscious of his ability to concentrate his mind in reflection. This concentration is often termed grouchiness. But take such a man and converse with him and his thorough knowledge will convince you of his serious disposition.

He has made friends, though he is not as popular as his competitor. He is competent, though he may not have given as long years of service. And why? Because he does not require these to form his character. When he sees errors he provides that there will be no repetition of them; he will study his problems till he is satisfied he has the correct solutions. His fellowmen must respect such a worker and will coöperate with such a superior intelligence. Thus it will be found that the student is the man whose service is most valuable to any corporation.

LEO H. MAYER.

1037 Maison Blanche Bldg., New Orleans, La.

Letter No. 4—Some of our railroads have tried to answer this question and have had it partially taken out of their hands by labor organizations, which insist on a more or less fixed rule of "seniority." This often works as badly as if there were no recognized line of promotion, but there is a principle involved which might be given more attention among coal operators.

To get the highest efficiency in labor it must be willing, interested and progressive. America is slow to recognize any fixed station in life for any individual, and no man is dropped so quickly out of consideration for promotion as the one who has "arrived," who holds a job, but is doing no more than simply what the job is supposed to call for.

On the other hand, it is too often the case that a man is not promoted because he fills well a certain place which is considered too important to risk a change, and yet of a class not admitting of an increase in pay. In order to stimulate interest, it is absolutely necessary to have a fairly well established line of promotion, and adhere close enough to the recognition of long, honorable service to put such deserving at a premium. Promotions depending absolutely on seniority soon develop a system which is simply a waiting contest with little superiority over that in which no definite promotion is in sight.

So much has been said about the popular "hustler," who elbows himself to promotion, that it sometimes seems a good idea to see if this "hustle" is just a product of recent successes, or if it is a quality which will continue through a considerable period of waiting. Strange we do not think of coupling the term "hustler" together with the quality of "long, faithful service," and apply them to the same candidate.

If I were boss and had under consideration the popular *hustler,* the steady, long-service *plodder,* and the competent *grouch,* I would send the latter to the doctor to have his liver treated, and then, consider the other two, first from the standpoint of what effect the promotion would have on my system of rewarding faithful service of all kinds, and second, as to the immediate results desired in the position to be filled. I would lean strongly toward long, steady, honest service, believing that rewarded faithfulness begets hustling, and that a little longer tryout should not stifle the ambitions of the true hustler.

In the coal business any system may have to go, however, if a "pinch hitter" is required. I might have to send for the man with the grouch.

JOSIAH KEELY,
Gen'l Mgr.

Cabin Creek Consolidated Coal Co., Kayford, W. Va

Letter No. 5—Everything else being satisfactory the man who understands a job, and has given evidence of the ability to handle it, is the natural nominee for the place. But, while technical knowledge and mechanical fitness are valuable factors in determining a man's desirability for any situation, they by no means qualify him for it.

We look for more than machine efficiency from men. Personal peculiarities have also their values and must be taken into account. The most competent workman discounts his own merits when he permits temperament or disposition to interfere with his efficiency.

No one man runs any job. He may direct or control it to a certain extent. But without the support and coöperation of every subordinate, the supervision of the most capable official is vain. And support and coöperation to be effective must be loyal and enthusiastic. Sullen service is more dangerous than active opposition.

The grouchy official can never figure on the loyalty of any man. That surly demeanor of his will alienate every friend, and cut out every ally in the struggle for results. It is the rift in the lute, the grit in the bearings of the machine that generates friction, heat and ultimate disaster. We should not hesitate to deduct a substantial ratio from the qualifying points of the grouch for his unfortunate temperamental shortcoming.

The case of the long-service, steady and honest workman is one that usually evokes popular sympathy. As there is no reference to any outstanding ability we must assume the possession of average ability only. And the honest, steady, average workman has his reward in steady work at average wages. Promotion to a position of greater responsibility or actual overseeing would be as unfortunate for him as it would be profitless and regrettable for his employers. The kindliest and most creditable act toward him would be to commend his faithfulness and industry, and increase the emoluments of his job.

Much could be said in favor of the popular, hustling, observing favorite of "the old man." We still believe in the education of the schools, and in the system and precision it evolves. But individuality is beyond its achieving. And, when all is said and done, it is the personal factor that is the determining one in human enterprise.

The popular, hustling, observing young man, of moderate accomplishments, will usually outpace and eclipse him who has a better grasp of the situation, but is lacking in tact and the knack of attracting friends and inspiring enthusiasm in others.

That hustle of his is based on a satisfactory grasp of the facilities of his task and is the issue of his habit of observation. Results will pile up and continue under his régime. His success will be a personal matter with every worker, and the smile of "the old man" will be like a lubricant to all the creaking sprockets and cogs that red tape interposes between routine and results.

J. R. ALLARDYCE.

517 S. Webster St., Saginaw, Mich.

Letter No. 6—The cartoon problem entitled "Who Gets the Promotion?" appearing on page 1030 of COAL AGE, describes clearly and with considerable force a problem that is continuously before all managers of large interests. In this particular instance, the selection of the man for promotion has narrowed down to three possibilities, each one representing an entirely different type of man. All of the applicants undoubtedly have given their best services and, considered as individuals, each one is entitled to whatever recognition in the way of promotion it is within the power of the manager to grant. But a selection must be made for this particular position, and however much the manager may feel like promoting the first man, who is popular with his mates, a hustler, observing, and liked by the "old man," he still feels that he lacks the one essential qualification for advancement.

The same is true in the case of the second man under consideration, who has been in the service of the company a long time, has always proven steady and reliable, honest and of good habits.

This, then, centers his attention on the third applicant whom he finds to be thoroughly qualified, in that he understands the duties of the new position thoroughly and in addition thereto is a student, which naturally leads to the belief that he will not let any opportunity pass by to increase his knowledge of the business.

This applicant's chief difficulty, however, is his grouchy disposition, which might prove a handicap in his intercourse with his fellow employees, but the manager finally decides that his duty to his company requires him to promote to this position a man who is fully qualified by his knowledge of the duties of that position, and decides also that, as manager, it will be his duty to take a *personal* interest in his new appointee and do everything possible to assist him in overcoming this one fault, feeling that it will be easier to do so than to promote a man who is not qualified by a thorough knowledge of the business.

A. W. CALLOWAY,
President.

The Davis Coal & Coke Co., Cumberland, Md.

Letter No. 7—If I were superintendent, the position would go to the popular man on the left, and my method would be one of elimination rather than selection. We will dispose of the third applicant, the one on the right, first. The fact that he is grouchy bars him from the place. A grouch would be the last man I would put in authority. There is scarcely a responsible position in mining in which the man who occupies it is not compelled to come in contact with men of all classes—employees, employers, buyers, sellers, etc.

And no matter to what class we belong, we are, after all, much alike, and all of us prefer the man with a pleasing personality to the grouch. It is advisable to treat employees with justice, and even though the grouch be absolutely just, his manner of dealing with his men has the appearance of unfairness. Miners are assertive. They not only ask for fair treatment, but demand it. And a grouchy man in a position of trust is a sure source of friction between employers and employees.

Employers who hold the pocketbook and know they can dispose of their foremen to their best interest, by promoting, demoting or discharging them, can get along with grouchy men. Still their intercourse will not be pleasant.

Send a grouchy man out to sell, and he cannot compete with the fellow with a smile. His product must be superior to that of his rival or the latter will get the trade.

The grouchy man may be a shrewd buyer, but he fails to gain the confidence, and at the same time, fails to secure the benefit of the experience of the man with whom he deals, and so, in spite of the fact that he is a student and understands the position, I reject the grouch.

The second applicant must also be rejected, but not so emphatically as the third. Long services, honesty, steadiness—these are weighty considerations, but they do not necessarily imply ability to fill the vacancy. A man who can neither read nor write might possess these qualities. Equipped with these good points, he could make a costly blunder every day. Now if he had the qualities needed for promotion, he would not be in competition with younger men, but would be occupying a higher position, gained during his period of long service. Vacancies frequently occur, and had he been fitted, his promotion would have come long ago.

And so I come to the first applicant, who receives the job. He is popular with his mates. Usually the man who is honest, square and sincere, who gives a fellowman a lift and has no exaggerated idea of his own importance is the man who secures such popularity. True, a man may sometimes become popular by being a spendthrift, through witty, senseless conversation and by going through life with a "devil-may-care" manner. But men of this stamp are usually seen through.

The statement that the "old man" likes him attests the character of the popularity the applicant has with his mates. The "old man" is a good judge of human nature, and he knows that the man has qualities worth-while. He wants to help the young man rise, partly for the sake of the young man himself, and also because he possesses qualities which the "old man" can capitalize.

The first applicant is observing and a hustler. He will, therefore, be a student and will soon become thoroughly familiar with the position, that is, he will soon have the qualifications of the third applicant. Only time is needed to put him on the same footing with the second applicant.

We may choose him, therefore, because he either possesses or will acquire all the characteristics that commend the other two, while neither of the others can develop the qualities of the first applicant, without special effort.

Geo. N. Lantz.

New Straitsville, Ohio.

Letter No. 8—In reply to the problem, "Who Gets the Promotion?" let us reverse the order of the cartoon and start by calling the party to our right No. 1. This man who understands the position thoroughly, a student, is grouchy. In order to be brief we shall not consider his appointment seriously, for any person who is grouchy cannot secure results from his subordinates; neither can he command the respect and confidence of his employers.

No. 2, the man of long service, good habits and honesty, is doubtless a very good follower, an exceedingly good man, and thoroughly able to perform the duties of his present position, but he would never make a successful leader. He lacks in aggressiveness and tact, and could not stand the pressure and responsibilities of a higher position. Hence, we will pass him up.

No. 3, the fellow who is popular with his associates, a hustler, is observing of the things that take place about him; he is liked by his superiors.

The days of the grouch are past. Men in responsible positions in and about coal mines cannot disregard the rights of their less fortunate brothers. Moral excellence is justly felt to be an indispensable element in the handling of all kinds of business. Men may be brilliant, clever and strong, but with all these, if they lack character they will certainly fail. The spirit of cheerfulness and good will predominates today, or should, in the transaction of business between employer and employee.

Men sometimes through personal favor and in spite of the fact that they have never manifested either ability or capacity, have been appointed to responsible positions. Such men as these invariably fail when placed in charge of important work.

Men are not always judged by their appearances and language when on duty and on their good behavior, but by what they do in their leisure hours. Someone has said that character is the invested capital of the young man. He should be an optimist and possess a cheerful countenance; he should have stability of character, aggressiveness and be filled with a determination to win.

Dean Stanley once said that every position in life, great or small, can be made as great or as little as we desire to make it. What you are settles the question of what you can do.

Therefore, if I were the boss, I would promote the popular man, who knows how to hustle.

Anthracite Superintendent.

————————, Penn.

Letter No. 9—Each of the three men is worthy of promotion at some time. The choice will depend somewhat upon the nature of the job for which the selection is to be made.

The man who understands his position thoroughly and is a student is, as far as his work is concerned, most certainly a logical man for promotion. His thorough grasp of his job will make it easy for him to direct the work of his subordinates. His being a student indicates that he will not be left behind as the methods of doing things in his industry progress and improve. However, his promotion should be deferred until he is able to overcome his grouchy disposition. Grouchiness causes unnecessary friction.

The man who is popular with his mates can usually secure coöperation, a very valuable consideration. When, in addition, he is a hustler and observing, he is desirable in any organization and is sure to win promotion at some time. However, on account of his popularity, is there not a risk that his decisions may be influenced somewhat by his opinion of their effect upon his popularity? Taking his qualifications into consideration with those of the other two, would it not be advisable to allow him to become a more seasoned worker before he is promoted?

The man who is steady and honest, with good habits, and a long record of service proves by these characteristics that his work has been satisfactory or he would no longer be with the company. Promotion in his case would be a great factor in increasing the efficiency of the entire plant, showing thereby the reward of faithful service.

No company can well afford to neglect the opportunity to show all of its workmen that it appreciates the value of dependableness, good habits and honesty. Moreover, the management is bound in justification of itself to consider favorably this man, for if a man with an apparently faultless record can render long service without chance of promotion, there is something lacking in the conduct of the business. It is likely to appear that no thought is being paid to developing the bosses of the future who must take the places of those who leave or retire.

Another point in favor of the man of long service is the stability that his continued service renders to any company. One of the greatest weaknesses of an industrial corporation is a constantly changing body of workmen. To overcome this fault and to develop a continuity of policy, nothing better can be done than to promote faithful employees deemed worthy of advancement. This will do much to correct the somewhat widely held supposition that a man must change from one company to another in order to better his position. After considering all of the above points, if I were the boss I would promote the man with a long record of service.

M. D. Cooper,
Mining Engineer.

Ellsworth, Penn.

Other Interesting Opinions on the Promotion Problem

[The following 20 letters discussing the cartoon "Who Gets the Promotion?" are of such great interest that we feel entirely justified in devoting space to their publication. A great many different points of view are expressed. There is no doubt but that some readers will find letters among those that follow which they would have selected for the final vote if they had been acting as judge. The contest, of course, is purely a friendly one, designed entirely to help all of us who are striving to advance our fortunes in the coal-mining field. This is a case where one man's opinion is just as good as that of some other fellow. Coal Age *appreciates, not only the interest, but the effort devoted to the discussion by its readers. We doubt if any paper printed in the interest of an industry such as coal mining, has ever advanced a question of this nature and met with such an enthusiastic response. It is such results as this that cause us to believe that our efforts are not wasted, when we devote them to the development and encouragement of the men in the mine, as well as to the mine itself.*—Editor.]

Letter No. 10—Which man shall I give the position? If I look too long at the men's faces I may be influenced by what appeals to my particular nature. I like the sunny atmosphere radiated by the first man; the honesty and steadfastness shown in the face of the second influences me strongly, while the sourness of the last man's countenance might make me overlook his sterling qualities. So I must try to forget personal appearances and judge on character, training, ability and general fitness.

The character of the position to be filled is not stated and thus one of the great questions to be solved, individuality harmonious with the work and men involved, cannot be decided. However, all three men are competent and thus the appointment depends upon which would serve best the corporation's interest. By "corporation's interest" the narrow view that it means making the most money in the shortest space of time is unacceptable. Rather, assume that it is a great undertaking which serves the people and will outlast the present generation of stockholders, who are broad-minded men and wish to leave to their posterity something enduring. This means "the greatest good to the greatest number."

The fact that the "popular man" is liked by the "old man" is probably generally known. If he is given the position the belief that favoritism was shown will be cultivated, thus generating the feeling among employees that there is no use trying, and that merit will not be rewarded unless one has a "pull." Some will try to ingratiate themselves by methods self-respecting men cannot countenance. A bad morale will be created.

If the "grouchy man" is given the post, true progress is impossible, for grouchiness on the part of the boss does not inspire men with good will. In some it engenders fear, which ofttimes turns to hate for those above and for the corporation. The grouchy man is apt to be selfish. First better try to show him wherein his failing lies and let him know that unless he overcomes it he cannot rise to positions his abilities could otherwise command.

The man, who through long, steady service has attained competency, who by good habits and honesty has established his character and won the respect of his fellows and superiors is *the* man. Some will say that the brightest or the hustler or the "good fellow" should have the job, but more will say that the long-service man deserved it and will feel that there *is* a chance if they work hard, because their efforts are bound to come to the attention of the "old man" and be rewarded, for the "old man" is square and doesn't "play favorites."

Thus good feeling is created, a goal is set to strive for by honesty, perseverance and ability and all good men will work for the best interest of the corporation.

Mining Engineer.

Salt Lake City, Utah.

Letter No. 11—The boss will pick the young man, not on account of his age, however, but in spite of it.

He wanted a man who was not only competent to fill the place, but was anxious to get it; so anxious, in fact, that he had manifested his wishes in the matter by preparing for it in advance. When he came to size up the eligibles, he found that only one of the three had really prepared for the place; imagine then his disappointment when he recalled that this man had been a grouch, and to all appearances was still a grouch. Think of trying to pass my enthusiasm down to my men through a grouchy assistant, thought the boss, they wouldn't recognize it when it got there. No! it isn't thinkable.

This left the old man and the young one.

Now the boss respects old age, and is always anxious to reward faithful service, but he reasoned that just because a man has good habits, is faithful and steady and has been long in the employ of a company, cannot be considered sufficient evidence that the man has ever tried to better his condition, nor that he would necessarily be a success in a higher position. Such qualifications simply bespeak a normal man who has deserved and received normal rewards and has no right to expect more.

I would be willing to take a chance with such a man if I had to, said the boss, but let's see if it is necessary.

The young man belonged to a different breed. One cannot be popular with his mates and with his boss by mere accident; he must take himself seriously, to say the least; thus reasoned the boss, and then he decided that one who is observing and is willing to hustle can make a success of most any position if he will only keep at it long enough. And so the young man was promoted, and although the boss was not able to make a sure bet, he felt pretty well satisfied with the prospects.

H. S. Geismer.

Consulting Engineer, Birmingham, Ala.

Letter No. 12—Of the three men presented in the cartoon, I would choose for promotion the central figure; the man who is "honest," "steady," of "good habits" and "long service." Leaving aside any discussion of the good qualities possessed by the other two applicants, I would give this man the promotion because I believe the first and finest essential of organization is the recognition of faithful service. Also, he must possess certain ability or he would not have been in the organization so long. To my mind, the fact that he does not yet thoroughly understand the position in question does not mean he cannot hold it. He has given a fairly good account of himself so far and he must take the new job knowing that if he can't fill it he can't have it long. That's the privilege and duty of a "boss," and I believe it is always good business to exercise it. I think some bosses fail to realize that there is such a thing as keeping a man in one place too long.

Promotion always heartens a man tremendously. A fellow must have a chance or he can't show what he can do. If he fails, then he can be taken care of elsewhere and there are always other men available. I do not think it is fair to a man or good for an organization to allow deserving men to remain in the same place or at the same pay too long. I always admired the man retained in a responsible position for years at the same salary, who wrote his boss and asked him to either raise his salary or lower it—he wanted to find what the boss thought of him.

I do not think any first-class man works for his salary alone. He will strive to prepare himself to earn more and when he sticks to any concern in this hope, he is certainly entitled to the call when the chance for promotion comes. To advance the man of good habits and steady character who has "Service" to his credit, will create a healthy feeling in the whole organization. Whether the man holds the place to which he is promoted is a secondary thing. He has been given his due and every man in the concern will feel better and work harder, knowing that the fixed policy of the "Boss" is to recognize service first.

In this case if the man after a full trial did not justify my selection I would explain to him that he could not retain the position and would put him in a less responsible place, for in a concern of any size there is always a place for a steady, honest man. I would then call up the other two men and select the better one of these for the place.

I am strongly of the opinion that any good man who serves a concern faithfully should have his chance. Where this policy is firmly established, men will work harder and feel better in spirit because they know they will be given the opportunity to develop any latent ability they may possess.

Personally, I'd rather be "fired" a dozen times than never have a chance at better jobs just because I satisfactorily filled the one I was in and I believe most men in every organization feel the same way. I don't believe you can discount faithful service, and if I were the boss I wouldn't try to.

NEILL HUTCHINGS.

Tennessee Coal, Iron & R.R. Co., Birmingham, Ala.

Letter No. 13—In order to come to a conclusion upon "Who gets the promotion?" requires a careful study of the three candidates for advancement. To quote the words of your magazine, "All are competent, loyal, of good character and good health." From the standpoint of the present, then, all are well fitted for the position. The question of the greatest moment, however, the one which confronts every man of business and on the solution of which depends his success or failure, is the question of the future. It is, therefore, by the standards of the future that we must judge the applicants.

The man on the right understands his position and is a student, but on the other hand he is a grouch, and as such would be unpopular with his men. The man in the center is steady, honest, of good habits, and has been long in the company's service. This latter consideration especially renders the company under obligation to him. But during his long term has he shown qualities necessary for promotion? If so, why has notice not been taken of him before now? He is old in the service, his habits are fixed, he cannot change his ways. His face would indicate a weak character, content to do his work and allow others to do theirs undisturbed.

The man on the left is popular with his mates, a hustler, observing, and liked by the "old man." Since he is popular he would probably be called on as foreman to arbitrate the petty difficulties which naturally arise, and the men will be likely to abide by the decision of one with whom they are on friendly terms. He is a hustler, and we may rest assured that his work will be thoroughly done. Furthermore, since he is observing, he will acquire knowledge rapidly, for to observe is to learn. He will soon come to know the shirker from the honest workman, and his observation will enable him to place men of merit in positions under him.

Now to sum up: We have learned that the man on the right is a grouch, so in view of the qualities of the others we can eliminate him from consideration. The company owes the man in the center a debt for long service, but that debt need not necessarily be paid by promotion. When not accompanied by the necessary qualifications or when over-shadowed by the ability of others, long service must be repaid by some other method than that of advancement. This brings us finally to the man on the left, who has the qualities necessary for a higher position; popularity, energy, observation, and a frank, open countenance. The "old man" with his years of experience sees the future possibilities of this man, and plans his appointment.

ROY ANTHONY.

Paulton, Penn.

Letter No. 14—

The choice of one to fill the place
Presents a very trying case,
Wherein the head and not the heart
Must calmly play the leading part.
The company expects the boss
To show a profit, not a loss,
And so his own career depends
On keeping up the dividends.

He dare not bow to sentiment,
Because it yields no 10 per cent.;
So he ignores the oldest man
In working out his running plan.
His keen and calculating eye
Dwells on the hustler, passes by,
And rests on him whose powers vouch
His fitness and his worth—the grouch!

E. KEMFER.

——, Penn.

Letter No. 15—The qualifications of the older employee are: Long service, steadiness, good habits and honesty. However, the first, rather than an asset, is a liability, because having done the bidding of others for so long a time, the subordination has stunted his self-confidence and weakened the judicial bearing needed for handling men. Past the prime of life his energy and ambition to progress have been gradually superseded by a nature set and opinionated along trivial lines and inclined to allow business to glide along the channels of least resistance.

The man on the right understands the position thoroughly, is studious and naturally progressive, but, as stated, he is grouchy. A morose disposition will not inspire men to their best efforts, but will cause good men to leave the employ of the company, while others who remain will labor with illy disguised hostility. So it is evident to the reader that the popular man approaches the ideal most closely.

THERNE V. SMITH.

La Follette, Tenn.

Letter No. 16—Any one of the three applicants pictured in your cartoon would strongly appeal to the man who has the promotion to make. Each appears competent and worthy in his present position, but there are qualities inherent in one which cannot be enumerated to the credit of either of the others.

Doubtless the man with the recommendations of long service, honesty, steadiness, and good habits, is a fit man in his present position. Experience has made him so—thus far. But new conditions are constantly arising which blind experience alone cannot surmount.

The student, possessed of thorough competency, has an advantage over his long-experienced brother. He is alert and alive to new occasions which teach new duties. Sad to say, however, he has an overwhelming drawback for "as no woman ever loved a fat man," as the legend goes, so this world has positively no use for a grouch, and we doubt whether the hereafter has either. A man with a sordid, sour countenance never works to the best interest of either company or employee, for if "it takes love even to make a donkey go," how much more so with a man. Men instinctively recoil from acid humanity and whether in work or sport seek the company of the individual worth while, the man with a smile.

The applicant of long service has undoubtedly been a great asset to the company in years past, but it is of the future that we must now think.

But the popular man, the hustler, the observing individual, who is liked by the "old man," possesses the combined requisites of his two competing brethren for the promotion in question. He has been indeed fortunate in avoiding or eschewing their faults. He is all they are and more. He is young, earnest, quick and alive to the interests of his employer, has observant eyes and is prompt to act in his hustling manner.

Popular with his mates, and liked by the "old man," what does this mean? In a word, it means better results. We all like to work for a considerate man; one whom we honor and respect, and we are far more apt to do a good day's work for such a one than for a slave-driver. Humanity ever craves some consideration, and probably will as long as its make-up is of flesh and blood. Being young and popular and observing, the man on the left is bound to grow in value to his employer and be promoted accordingly, carrying on the exacting duties of his job meanwhile with vigor, with circumspectness, with economy and efficiency, yet without that friction, which frequently mars industrial relations.

"Long Service" is a mighty good man, infinitely more to be desired than "Grouch," but "Popular with his Mates" in my opinion should receive the promotion.

JACOB ROSSER.

St. Nicholas, Penn.

Letter No. 17—Were I the boss portrayed in the cartoon, I would choose the man popular with his mates, the hustler, the observing, the one liked by the "old man."

All are competent, loyal, and have good character and health, but one of the three has more than these qualifications; he has a good disposition, with depth of character; hence his popularity with his co-workers and with the manager.

Your introductory note states that: "All of the men before him are competent, loyal, of good character and good health." This man must be steady, or loyalty could not be numbered in his qualifications; he has good and no bad habits, or his health would be impaired, and he is honest, or his character would not be good. He also understands his position thoroughly, for surely competency means no less.

He thus has all but three of the qualities attributed to his rivals, for they are all involved in those listed as his distinguishing traits. True, he has not long service as has the older rival, nor is he a student with a grouch like the third man. The claim of long service should be most certainly rewarded but not with promotion. The best years of the old man are behind him. The other man's good quality, studiousness, is entirely discounted by his tendency "to grouch." Good cheer is absolutely essential to success.

If the "popular" man gets the promotion, the boss need have no misgivings as to the wisdom of his choice. He has elected the most efficient, the best equipped and most likable of his three employees to fill the vacant position, one which is full of responsibility and demands intuition, tact and ability from the incumbent. All these three qualities are possessed by the "hustler."

READER.

——, McDowell Co., W. Va.

Letter No. 18—Of the three men available for promotion, choose the one with the characteristics "popular with his mates; hustler; observing; liked by the old man." Men of this type are generally of more value to an organization than those having the other qualifications.

The center man, he of the "steady and faithful" characteristics is, no doubt, one of the mainstays in the business, and his position is doubtless hard to fill. But although his services should be acknowledged and rewarded, he should be retained in his present capacity unless his promotion is desired for some particular reason.

Neither, other things being equal, should the studious man, the third one in the line, be promoted. It would be more advantageous to find some special work for him that is better suited to his studious and analytic turn of mind. A man of this type is rarely able to lead other bodies of men so as to reap the best results from their collective efforts. He often neglects the broader duties of his position in order to concentrate on details which should be left to the care of his subordinates.

Promote the man who is popular with his mates and with the boss and who has the hustling and observing way of doing things. Promote the optimist, for he is the man everybody likes. They like him because of his contagious happiness and enthusiasm. These qualities are irresistible; they lead us on so that we are bound to follow.

A man may be faithful and steady when things run along in the usual way, but when a particularly big job turns up he is liable to lie down. A man may be skillful and thorough, but when a particularly mean job comes along he is liable to balk. But for the real trouble-fighter choose the optimist. While the other fellow is proving to you that the job cannot possibly be done, he has made a start and is probably half finished. The fundamental virtue of life is bravery; bravery to start to do the difficult thing.

Russel S. Dart,
Mining Engineer.

44 W. 77th St., New York City.

Letter No. 19—In giving this promotion to "Long Service," I am following the plan of at least two of the most efficient organizations in the United States—a plan that has often been tried and which ultimately has proved good. The fact that this man was being considered along with two other men, much younger in years and service, shows that length of service alone is not always taken into account in the question of advancement. But in this case there is excellent opportunity to show to every man about the plant that loyalty, competence, good habits and long service will surely be rewarded.

Aside from a desire to carry out the policy of the company, there is in my decision a little matter of selfishness. While in a way I am working for the best interests of the organization as a whole, I am, in the last analysis, working for myself. I know "Long Service" well. He has his shortcomings; but so have I, and knowing each other we can do effective team work. I shall be able to anticipate his failures and so can help him before he makes any grave error. He has shown me that he will do all he can to make any good scheme of mine a better one, and, what is more important to me, personally, and also I take it, to the plant as a whole, he will, keeping his own counsel, work his head off to make any indifferent scheme of mine less of a failure.

And, as still further evidence of my selfishness, my decision retains me two other good men. Neither "Popular with his Mates" nor "Student" will resent my promoting "Long Service"; while it is possible that the first with his friends might question the advancement of the second, and it is certain that "Grouchy" would attribute the promotion of his younger fellow to "pull."

I had it in mind to wind up with a word of apology and encouragement to my two young friends; but I am so pleased with my wisdom that I feel that none of either is necessary. They will both be glad with "Long Service" and both will know that their reward will come in due season.

Colorado Engineer.

Trinidad, Colo.

Letter No. 20—The answer to the question "Who gets the promotion?" depends largely upon the nature of the position to be filled.

Assuming that the position is to be that of mine foreman or one that deals chiefly with the handling and management of men, and provided it is in direct line for a superintendency in the future, there are three main qualities essential to success; namely, energy, knowledge and the ability to control men.

All the applicants in the cartoon have important places in any organization, and either one would probably excel the others in the particular position to which he is adapted, but they are men of different natures, and therefore are not suited for the same position.

Judging from their description and appearance, I should say that the student is a man quite distant, reserved, who has spent his time gaining knowledge of other things than human nature, developing the intellectual rather than the social side of his character. His knowledge of facts and theories is indispensable, and without it but little progress would be made, but he is not suited to manage men, and should be given a technical position if possible.

The man of long service is evidently one who has not tried to develop any definite side of his nature, but has given his spare time to other things, probably his family. He has never shown any marked intellectual quality, but has been a faithful worker. Such men usually deserve better treatment than they receive.

But the superintendent of today seems to be the popular hustler, the man who can adapt himself to new methods and changing conditions, and who is capable of handling any organization of men. The man who is congenial, appreciative, impartial and courageous, and a close student of human nature, possessing meanwhile a fair amount of technical knowledge, is the man that climbs the fastest in the operating department. Such a man cannot be put aside.

Davis Read.

Sturgis, Ky.

Letter No. 21—I am afraid I shall be with the great majority if I choose the popular, observing and hustling man as pictured in your problem cartoon. In American commercial and industrial work he would probably be selected for promotion and leadership because, to be popular with his co-workers, a man must have a general education and possess some propelling personality, otherwise his companions will not look up to him for guidance. In being a hustler and observer he has two qualifications which, coupled with good judgment and common sense, would gain for him recognition in any position, even if he were not well educated.

By observation he cultivates the use of his gray matter, becomes alert, is always ready to apply new ideas for the improvement of old systems and frequently introduces original methods. By observation he naturally becomes a student, and with his ability and desire to hustle he will quickly succeed. The fact that he is liked by the "old man" sometimes overshadows any small deficiency he may have and places him in the front. The "old man" probably likes this employee because he always speaks well of his superiors as well as his subordinates and guards and weighs carefully any expressions concerning his company's affairs when talking to outsiders. He is neither loud nor positive in expressing his views and is always willing to learn.

The man who thoroughly understands his job but has the misfortune to possess a grouchy disposition is handicapped by this unfavorable trait, which mars the excellence of his work, and no doubt impairs his ability as an executive. It is not always the highly educated and studious man who makes the best employee or superintendent, and although this type of man knows how, he might lack the willingness to impart his knowledge to others. He is apt to think and express himself as knowing more than his "boss," which will eventually prove a stumbling block on the road to his success. His grouchy disposition would also tend to repulse men who would otherwise like to confide in him.

The "long-service" man with his honesty, steadiness and good habits has all the qualifications that could be desired in any man and the promotion should, by all natural laws, go to him; but his mind and life have lost their keenness and adaptability in the slow, conscientious grind of his work. Consequently he does not fit into our present-day progressiveness. Many a man of these same virtues can give instances in which he has been passed over in making decisions of this kind. Long service, although worthy of all honor, is often harmful inasmuch as it narrows a man's mind and makes it slow to receive and adopt new methods. As a rule, the "old hand" becomes touchy and resents suggestions made by younger minds. He is often tolerated because of his long service; whereas, if he were a younger employee, reprimands of no light character would be in order.

BYKEM.

Will County, Ill.

Letter No. 22—We can all think of certain phases of coal mining where the individual traits of all three contestants might be desirable, but, since we do not know in which department the promotion is to be made, we can only discuss the problem in a general way.

I am going to award the promotion, therefore, to the man with good habits, honesty and steadiness, to the man who having those qualities has been long in the service. His advancement will serve as a notice that long-continued, faithful service will not go unrewarded.

In closing, we should pay our respects to the cartoonist, Greene, who has provided his student with a "grouch." A studious nature is nearly always accompanied by this failing. It seems a sort of trick to which the fates resort to detract from the pleasures of knowledge. It places these men nearer on a level with their less erudite neighbor and preserves the equilibrium of the world's happiness.

ERNEST L. BAILEY,
Mining Engineer.

Crumpler, W. Va.

Letter No. 23—I think the man who is popular with his mates, a hustler and observing, is the one who should get the promotion. I believe this for the following reasons: The really valuable man is the one who is a hustler when hustling accomplishes something. Some people always hustle, yet when the day is done there is nothing accomplished. When I speak of hustling, I mean the real live hustler, the man who, when he hustles, put things in motion and keeps them going.

As for being popular with his mates, I consider this an essential quality in the make-up of a really valuable man. In order to keep pace with the times, a man should mingle with other men and keep in touch with what is "doing." Being friendly is a trait which costs little and secures to the man who exercises it the good-will of his fellows. Thus all will work in accord to keep their boss "on the top of the heap" when the tonnage is being compared at the end of the month.

When a man has the good-will of those about him, they take a live interest in their work, and as soon as a defect is noticed in any machine or appliance, he is promptly notified, possibly saving an hour or two of delay. On the other hand, the "grouch" who goes around all day finding fault with everybody except himself will receive similar notification only after some time, and in many cases machinery will be allowed to go to ruin, the negligence being palliated by the familiar expression, "Let him go to h—— and see things himself. He's only an old dub anyway."

Of course, popularity should not be carried to extremes; there is a limit, and any man with good judgment can readily determine the difference between friendliness and intimacy, and can seek to secure the one while avoiding the other.

I am sure all will agree that the man who wants to keep in line for positions ahead must be studious. The man who can acquire knowledge and use it to the advantage of his employer is a valuable man, but unfortunately all students are not thus gifted.

As for the man of long service, good habits, and honest, I would say that one who has spent the best part of his life working for a company should be given worthy consideration.

As for honesty and good habits, I feel that no man should be considered for promotion who does not possess these qualities.

Any man wishing to build up a good live organization should select for promotion the man who he feels can in the long run make the dollar multiply oftenest in the safest possible manner.

TIMOTHY A. RYAN.

Hazleton, Penn.

Letter No. 24—It is my opinion that No. 1 gets the promotion, he who is also characterized as a hustler, popular with his men, and liked by "the old man." Speaking from a varied experience covering many years as an employee desirous of advancement, and then again as an employer to whom the responsibility of promoting or discharging fellow employees fell, I view those three qualifications as covering a multitude of other characteristics, some among them even being qualities which may well be regarded as shortcomings in a mine official. It is a truth as many an otherwise good mining man has found out to his sorrow that the qualifications mentioned aren't such as can be dug out of textbooks, yet they are preeminent steps toward success in mine management.

Our sympathies, of course, are naturally with the man of good habits, long service and sobriety. He is of a type found at every large plant, and no doubt he has the sympathy of "the old man," too. But we must assume that his "long service," "sobriety," and general good habits are an indication that he lacks the chiefer essentials owned by No. 1, for otherwise he would not have remained stationary so long on the line to a higher position. He is a "good man," but mere goodness does not always indicate 100 per cent. efficiency, as an uptodate mine official, who, handling a composite situation, must himself be composite.

No. 3 being a man who thoroughly understands his work, but is "grouchy," nullifies by the latter quality all he gains in the former, at least where many men are employed. In my opinion no man can successfully be a chronic "grouch" and a first-class mine official. The owner, himself, may occasionally indulge in a fit of ill-temper, but even in his case, or in that of the general manager, it is a dangerous hobby where dividends are desired.

S. C. Reynolds,
Safety Inspector.

Aetna Liability Insurance Co., Houston, Penn.

Letter No. 25—If I were the boss I should not hesitate for a moment to reject the grouchy student, although he may understand thoroughly the duties of the position to which he aspires.

The "long-service" man, who is "steady," of "good habits" and "honest," would incite my sympathy and admiration and cause me to pause. After this pause, I would turn my eyes toward the observing hustler who is liked, therefore likeable, and he would be my choice for the position to which the three aspire.

The physiognomies of the men as presented by the cartoon have an immense bearing on my decision, and the kindly and hopeful spirit pictured by the face of the man of my choice impresses me with his value for present and future service. I am sure that moral suasion and kindly leadership would be his method of controlling men and producing results.

Human nature and noble manhood revolt at the driving method employed by a grouchy master, while the smile of the kindly spirit awakens ambition for faithful and effective service. Long and steady service and good habits have evidently crowned No. 2 with a high reward—the accumulations of his labor and the plaudits of his manager and mates.

The boss being responsible to the man higher up for all errors of the organization he has built cannot allow human sympathy to sway his judgment in making his selection, but must look for strength to accomplish. He can best find it in the brawny arm, the cheerful face, the hopeful eye and the ambitious heart of the man I have chosen.

Frank V. Evans.

Birmingham, Ala.

Letter No. 26—My preference is for the man of long service, steadiness, good habits and honesty.

It is difficult to realize how such a man can avoid having on his side most of the specially good points displayed by the other two candidates. Thus, he is bound to be "liked by the old man"; he surely must also "understand his position thoroughly"; and he cannot but be "popular with his mates."

Being a steady man of good habits, he will almost certainly be a reader of his technical or "trade" paper, and consequently be uptodate in his own branch of labor.

The first applicant is "popular with his mates," but in the absence of any information regarding his habits, honesty or steadiness, we fear that this trait might not always work to the advantage of the firm, if this man were placed in a position of trust.

He is also a "hustler," but nothing is given as to his knowledge or experience, consequently it is possible that his "hustle" might not always be effective.

In view of the merits of the other applicants, it would be taking too great a chance to give this man the promotion, with his habits, character and experience in doubt.

The points given in the third man's favor are depreciated by his grouchy nature, as cheerfulness and a spirit of good fellowship are essential factors in the successful official.

Wesvania.

————, W. Va.

Letter No. 27—It is stated in your article that these three employees are all competent, loyal, of good character and good health, and presumably these qualifications exist to the same extent in each man; therefore, we can eliminate two of the characteristics also given as the attributes of the employee who has seen long service, namely, good habits and honesty, for if a man has good character, it follows that he will likewise have good habits and be honest. The assets of these employees on which is based their chance for promotion are then as follows:

First employee: Popular with his mates, hustler, observing, liked by the "old man."

Second employee: Long service, steady.

Third employee: Understands position thoroughly, student, grouchy.

It is assumed that the new position will carry with it increased work and responsibilities, with fixed relationship toward fellow employees.

As a help in deciding which of the three men to raise, I have alloted a certain number of credits for each characteristic as they appear to me, disregarding the virtues they possess in common, as stated in the premises, viz., competency, loyalty, good health and good character:

POINTS FOR MERIT AND DEMERIT

Understands position thoroughly	75
Long service	40
Student	25
Observing	25
Steady	25
Hustler	25
Grouchy	25
Liked by "the old man"	10
Popular with his mates	25

It is an easy matter now to figure out for the boss which man to select from the above rating, and in so doing we find that the "popular" employee is entitled to 85 credits, the "long-service" man to 65 and the "studious" competitor to 75, the last named having sustained a demerit of 25 points because of his grouchiness.

It is to be regretted that the second employee cannot be recommended for this advancement; however, he has evidently neglected, in his long years of service, the betterment of his condition, through lack of study, observation and making himself thoroughly familiar with the different positions probably held by him. If these matters had been attended to, he, instead of the boss you have shown, would probably now be making the decision as to the man to be promoted.

It is hard to pass the third employee by, for when a man understands his work thoroughly, he is generally the right man to advance. However, this particular fellow is "grouchy," and this handicap is too big to overcome when there is more or less dependence on fellow employees for success.

Considering everything, therefore, we are recommending to the boss that he appoint the first employee to the new position, and we wish success to him.

Coal Accountant.

Washington County, Penn.

Letter No. 28—To all appearances all three are good men. First, there is the man who understands the position thoroughly and is a student but is grouchy. Such "touchy" individuals are fast disappearing from among the list of officials, for with all their knowledge they are unable to get their subordinates to coöperate with them, and nine times out of ten are desirous of filling all the subordinate places themselves, feeling that otherwise the work will not be well done. They are good workers but the mere worker is a loser.

Second, there is the man of long service, who is steady, has good habits, and is honest. This man is more liable to work for his salary than for the honor of the position. The man who works solely for his pay is a sorry workman and not much in demand as an official.

Third, comes the man, "popular with his mates, a hustler, observing, liked by the old man." In my opinion he is a man much in demand in the last few years, as all the progressive companies are looking for men of his type.

He is a man who doesn't need to be watched; he is able to get his subordinates to coöperate with him, has enough aggressiveness and will power to put things through, and he nevertheless remembers that there is wisdom in consultation even with his subordinates. Through friendly conferences he gets the good-will of the latter and this is the most valuable asset a company can have. He is the man who not only meets his troubles, but eliminates them as much as possible, and he so identifies himself with his duties that you will hear him talk of "*our* company, *our* mine and *our* tipple," and to men of his type success is assured.

C. J. Fuetter,
Electrician.

10 Ridge Ave., North Braddock, Penn.

Letter No. 29—I would first consider the "long-service" man. If he had the other good qualities, the necessary hustling and observing characteristics and understood the job, he would get the promotion. If he lacked these attributes, I should be untrue to the trust imposed in me if I promoted him.

I should feel it my duty to promote the best man for the job regardless of personal feelings, and if that man can be found among those long in service, it should be given him not only because he is entitled to it, but as an incentive to other men to work for promotion and remain in the service.

If this course is not pursued, a spirit of discontent is apt to be aroused and the employees feel there are no adequate rewards for faithful and efficient service. If the long-service man did not measure up to the requirements I would turn to the hustler provided he was faithful and honest and understood the job.

Edward H. Coxe,
Mining Engineer.

La Follette, Tenn.

Letter No. 30—You can place my vote on the "popular" man. His countenance is greatly in his favor, showing greater vigor, stamina, alertness and intelligence than the physiognomies of the other two. But his popularity is one reason for my favoring him. This quality goes with a knowledge of human nature, the essential need in the operation of any concern.

Then he is a hustler. Somehow that word does not convey a mere worker. The word hustle combines the idea "work" with "contagion." The worker works alone; the hustler charges the whole atmosphere with energy, and work that seemed laborious to his fellows now appears to be done without effort.

Further, he is observant. He can, therefore, select his men and shift troublesome workers from job to job till the job and the man are in harmony. He notes the seeds of dissatisfaction before they germinate and he has no use for the man who seeks his living in making trouble.

The man of long service has little title to promotion. It has not taken long to tell if the younger man is fit and the older unfit. Nor does the grouch receive my vote. True he may get over his bad habit in the future, but I want a man to take charge today. With a wet place and rock mixed with the coal, the miner's lot is hard enough without a grouchy foreman or superintendent to stir him to revolt.

Subscriber.

Nanaimo, B. C.

Additional Replies to the Cartoon Problem

Letters were received from the following Coal Age readers, and are given under their proper classification, so far as their expressed choice is concerned. It may be stated further, that all of these letters were selected in the first examination of the replies to the cartoon problem as being worthy of publication. It is quite likely that a different set of judges might have selected some of these letters that are not published instead of those that are printed on the preceding pages. We are sorry that a lack of space prevents our using all replies sent in. The discussion, however, is one we do not want to carry over to later issues of Coal Age. The answers below are from men in all positions from general superintendent to fireboss and miner:

For the Popular Hustler

H. B. Miller	Pittsburgh, Penn.
H. L. Fickett	Belle Ellen, Ala.
James Dickson	Nanaimo, B. C., Canada
A. N. Young	Masontown, Penn.
R. Z. Virgin	Colliers, W. Va.
John Hammond	Coral, Penn.
W. S. Dutton	Scranton, Penn.
William Derbyshire	Coal Bluff, Penn.
Miner Raymond	Tiffin, Ohio
Frank Black	Philadelphia, Penn.
W. H. Beck	Ellsworth, Penn.
John Rose	Dayton, Tenn.
Jacob Riley	Universal, Ind.
R. B. McDowell	Ligonier, Penn.
J. W. Bischoff	Elkins, W. Va.

Reuben Edwards	Philadelphia, Penn.
Robert H. Winn	Koehler, N. M.

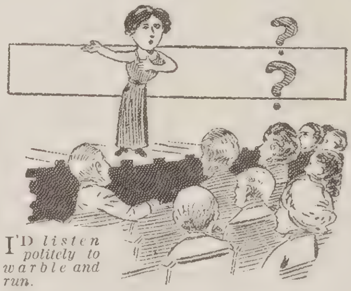
Coal Production of India

According to the daily *Commerce Reports,* the inspector of mines for India reports that in 1913 the output of coal in the whole country was 15,486,318 tons. This is an increase of 10.27 per cent. over the output of the previous year and is a record in quantity for India. At the same time the report shows a drop in the rate of increase which was 0.83 per cent., 5.80 per cent., and 16.56 per cent. for the three previous years, respectively. The drop in the rate of increase was caused in part by the flooding of mines in Bengal and Behar. Abnormal floods were experienced there.

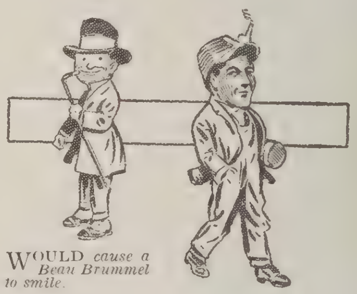
CONTENTMENT

Written Expressly for COAL AGE *by Michael Bernard*

AND *thinking alone makes me faint.*



I'D *listen politely to warble and run.*



WOULD *cause a Beau Brummel to smile.*

I'VE never been caught in society's thrall;
I'm shy of its follies and frills;
The sight of a bid to a regular ball
Would give me a case of the chills.
I think of the gowns that the women would wear,
The powder and patches and paint,
Combined with the music and perfume and glare,
And thinking alone makes me faint.

But let me clasp one horny hand
About an iron brace,
And feel the cage beneath my feet
Drop swiftly into space,
And let me smell the sooty lamps
That flicker in the murk,
And I'll not envy any man
The nature of his work.

IF some one invited me kindly to go
To hear a famed vocalist trill,
The chances are strong that I'd take in the show
Very much as I'd swallow a pill.
I'd listen politely to warble and run,
And join in applauding, no doubt,
And yet be in ignorance, when it was done,
Of what the whole thing was about.

But put me at the working face,
In some secluded spot,
Where I can smash to smithereens
The silence with a shot,
And no one on this earthly ball,
Though czar or king he be,
In satisfaction or content
Will have a thing on me!

I'M not much for fashion, I'm free to confess;
I'm woefully lacking in style;
And doubtless my nondescript manner of dress
Would cause a Beau Brummel to smile.
If any one managed, by hook or by crook,
To hang a clawhammer on me,
I'd probably feel just the same as I'd look—
Like a flounder a league from the sea.

But put me in my overalls,
Grown black and stiff with dirt,
And let me fling my shiny coat
Upon my ragged shirt,
My miner's cap set rakishly
On hair untouched by comb,
My water-bottle at my hip,
And say, I'm right at home!

The Hampton Roads Coals--II

By F. R. Wadleigh*

SYNOPSIS—A description and history of the development of the Pocahontas Flat Top field are given in this installment. Particular attention is devoted to a study of the quality of different coals in the field. The uses of the fuel, transportation problems and other points are also covered.

Pocahontas Flat Top Field

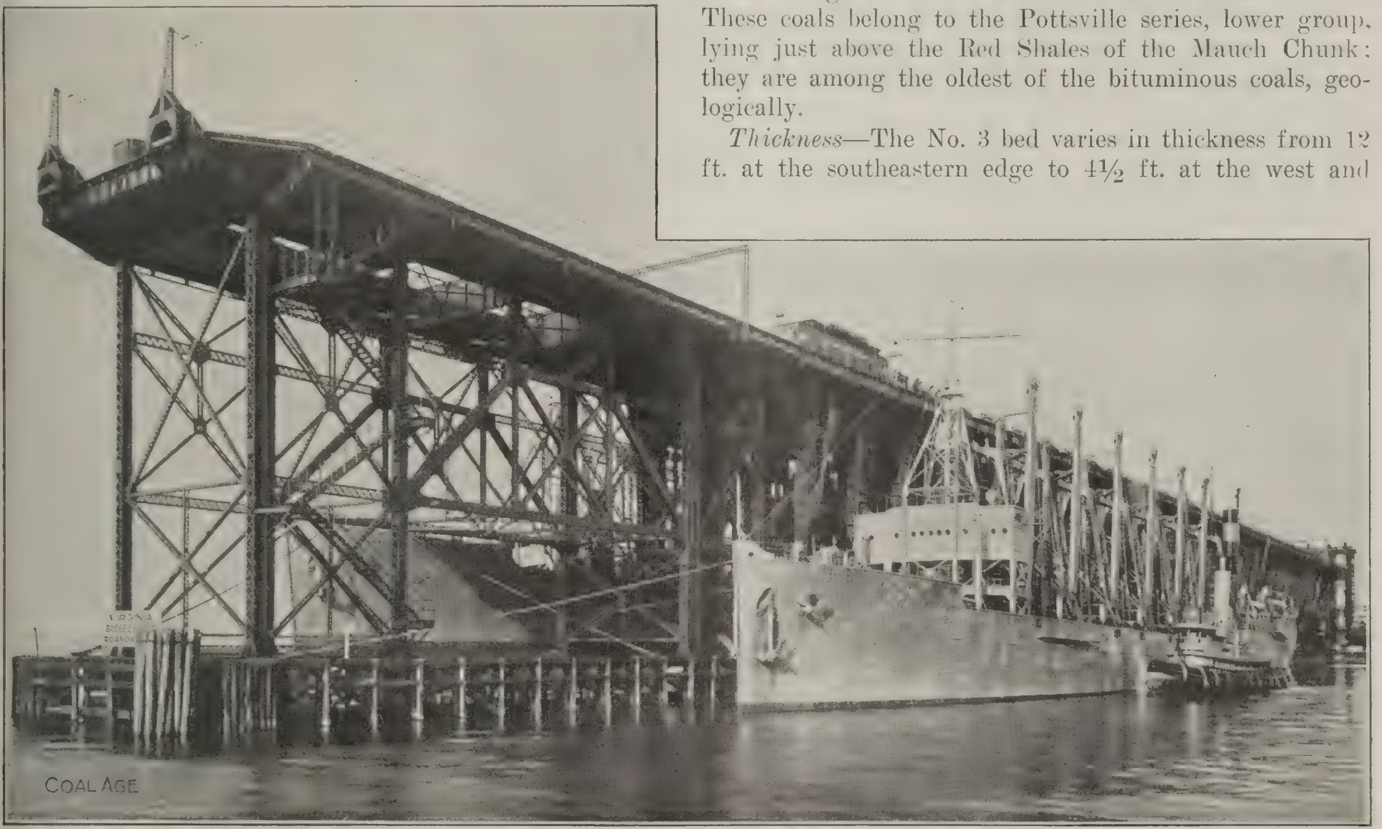
The first mine of Pocahontas coal was opened in this field in 1883, in the No. 3 Pocahontas, or Nelson bed, as it was originally called. In that year the entire output was only 60,828 tons, but at the end of 1913, 141,168,419 tons had been mined from this and the No. 4 bed. To Major Jed Hotchkiss, of Staunton, Va., is due the credit for first making known to the country, the value and size of the Pocahontas coal beds, although, for years previous, the coals had been dug out by farmers and country blacksmiths for their own use.

From the Pocahontas Flat Top field comes 87 per cent. of the commercial shipments of Pocahontas coal. It is this district that has made Pocahontas the standard steam coal of the country and the best known in foreign countries. This is largely because of its quality, but is also due in part to the aggressive and intelligent advertising and sales methods of Messrs. Castner & Curran, who were for many years the exclusive sales agents.

Coal beds—The beds mined are the Pocahontas Nos. 3 and 4, but by far the greater development is in the No. 3, about 90 per cent. of the total shipments coming from this bed; although the coal from the No. 4 is quite equal in quality to that from No. 3, the former is not so thick and its location for development is not so advantageous.

Geology—At the point where the Pocahontas measures are most extensively mined, on the southeastern edge near Pocahontas, eleven beds of coal have been found by borings from the top of Flat Top Mountain; of these, only two, Nos. 3 and 4, numbering from the bottom, are of workable thickness over the whole area. The measures all dip toward the northwest with a gradual thinning out and a change in the roof conditions in the same direction. These coals belong to the Pottsville series, lower group, lying just above the Red Shales of the Mauch Chunk; they are among the oldest of the bituminous coals, geologically.

Thickness—The No. 3 bed varies in thickness from 12 ft. at the southeastern edge to 4½ ft. at the west and northwest, the average for the entire field being 6½ ft.



General View of the Norfolk & Western Pier No. 4

Partings—As a rule, two partings are found in the seam, each varying from a fraction of an inch to two or three inches in thickness; one of these is a bony coal, carrying from 15 to 25 per cent. ash, and is of some value as fuel; the other is a hard slate, of no fuel value whatever. Both bands are rejected in mining or thrown out by the cleaners outside of the mines.

Vast quantities of this bony coal have been burnt in piles or used to fill in ravines and for other such purposes. At some of the mines, efforts have been made to burn it under boilers, either alone or mixed with the clean coal and it has also been crushed and mixed with the slack used for coke making, but by far the greater part has been a total loss.

Yet this bone coal has a distinct value as fuel. In 1907,

---

*Consulting Engineer, 426 Real Estate Trust Bldg., Philadelphia.

I suggested having a car shipped to the U. S. Geological Survey Testing Plant, at Norfolk, Va. This was done and briquettes were made with 5 per cent. coal-tar-pitch binder, the briquettes analyzing as follows:

Moisture	1.71
Volatile	13.96
Fixed carbon	68.36
Ash	15.97
Sulphur	0.42
B.t.u. dry	12,938

It was stated that: "It made excellent briquettes, firm, smooth, broken with difficulty and with a close-grained fracture." Rough tests made in a stove and on a harbor tug proved that they made a good household fuel and kept up steam under boilers without any difficulty.

At the Pittsburgh Testing Station, some of this bone was also tested on gas-producer work, there being a consumption of 1.02 lb. per i.hp. per hr., the briquettes having a heating value of 12,994 B.t.u., dry coal.

No. 4 Bed—The No. 4 bed averages 5.9 ft. in thickness, as measured at the mines where it is being developed.

Description of Coal

Pocahontas coal is a bright, friable fuel, of columnar structure, ignites readily, cokes strongly, burns with a short white flame and comparatively little smoke, combustion being slow but intense heat and yields a reddish-white or brown clinker. The clean coal has a high heating value and is low in ash, sulphur and phosphorus; the fusing temperature of the ash varies considerably, some of it running over 2600 deg. F., and some as low as 2150 deg. F., the constituents of the ash also varying in their proportions.

In certain parts of this bed the fracture surfaces of the coal show a coating of thin, brownish-white scales, varying from the thickness of paper to one-sixteenth of an inch. The amount and thickness of this scale will vary at different places in the same mine. An analysis of the scale gives the following results:

Silica	3.82
Ferric oxide	0.10
Alumina	5.94
Lime	78.14
Magnesia	0.41
Undetermined	11.59

The effect of this on the fusing point of the ash is yet to be exactly determined.

While the ash, oxygen, sulphur and heat value are practically constant in the clean coal, there is considerable variation in the percentage of volatile. Starting at the southeastern edge, where the coal is thickest, the volatile decreases as the seam dips and thins out.

Taking the Bureau of Mines analyses from 67 mines, all by the same chemists and using the same method, there is a maximum variation of 7.2 per cent. in the amount of volatile, from 19.21 to 12.00; the average of all the analyses is 14.29. These Bureau of Mines analyses all show a lower volatile content than is obtained in any other set of analyses. For instance, the West Virginia Geological Survey gives an average volatile of 17.47 in samples from 38 mines. This difference is due to the method used in determining the amount of volatile.

The average volatile in samples taken from 407,000 tons shipped to the Panama Canal, samples taken and analyses made by the Bureau of Mines, was 18.25, which is considered a fair average for the Pocahontas beds.

Analyses of Pocahontas Coals

A very comprehensive analytical review of the Pocahontas coals was made in the third installment of an article I wrote on "Our Future in the Export Trade" which appeared in Coal Age, Vol. 3, p. 364. The following supplemental analyses will cover the field in its entirety:

		No. 2				No. 4				
	No. 1[1]	Average	High	Low	No. 3	Average	High	Low	No. 5	No. 6
Moisture dry coal	3.03	3.29	4.4	2.3	2.966	3.588	4.1	3.00	2.245	3.252

[1] As received. Dry coal contains 5.41 and shows 14,931 B.t.u.

No. 1.—Average analysis of samples from shipment of 13,662 tons, 1909-10.

No. 2—Pocahontas No. 3 Bed—Average of 68 analyses, each analysis representing a composite of two or more samples from 68 mines.

No. 3—Pocahontas No. 4 Bed—Average of 3 analyses, each analysis representing a composite of two or more samples from 3 mines.

No. 4—Davy-Sewell Bed—Average of 9 analyses, each analysis representing a composite of two or more samples from 9 mines.

No. 5—Welch Bed—Average of 4 analyses, each analysis representing a composite of two or more samples from 4 mines.

No. 6—All Beds, Pocahontas Field—Average of 84 analyses, each analysis representing a composite sample from 84 mines.

Note—No. 1 analysis is from U. S. Bureau of Mines Bulletin No. 41 and remainder are all from Bulletin No. 22. Moisture is separately determined in all cases, the remainder of each analysis being on dry coal.

Uses

Pocahontas is primarily a steam coal, best suited for stationary plants and ships' use, but also a very good locomotive fuel, especially where freedom from smoke is desired. Its use for the latter purpose has decreased owing to the marked tendency on the part of the railroads to use higher-volatile coals, because they are cheaper, stand handling better and, it is claimed, will make more steam in a given time.

The Pocahontas product is also a strong coking coal, 79 of the 99 mines in the district having their own ovens, all of the beehive type. Twenty-eight million tons of coke have been made in this field since its beginning; the production reached its maximum of 2,084,000 tons in 1910 and has decreased since. The newer mines have not built coke ovens, though the older ones were compelled to do so under the terms of their leases; up to a few years ago, coal cars were also distributed on the basis of the number of coke ovens at each mine. But now large amounts of coal from this district are shipped to byproduct coking plants for mixture with higher-volatile coals, to give the coke a better structure.

For use in kilns or furnaces, where a short-flame coal is desired, Pocahontas is well suited. It is also a fine domestic coal, the screened sizes as well as the run-of-mine being sold largely through the Middle West for this purpose, as it is superior in heating value to anthracite and has a much lower ash content.

ANALYSES OF THACKER COALS

No. 1.—Average of air-dried samples from four mines in the Thacker bed, West Virginia. (From the West Virginia Geological Survey, Bulletin No. 2).

No. 2.—Two of the best coals in the Thacker district. **A** is an analysis of samples taken from a car of mine-run coal by inspectors from the United States Bureau of Mines. **B** is a mine sample taken by the West Virginia Geological Survey inspectors, the latter being an air dried sample.

No. 3.—Analysis of mine samples (from United States Geological Survey, Bulletin No. 541).

No. 4.—Analysis of mine samples taken from the United States Geological Survey, Bulletin 541.

No. 5—Average of six mine samples from the Freeburn (Van Lear) seam on Pond Creek (from the Kentucky Geological Survey, Series 4, Vol. 1).

Note—Analysis No. 1 is air-dried coal. In the others the moisture is separately determined and the remainder of the analysis on a dry-coal basis.

Between the Pocahontas and Thacker mines, there are also some developments in the Eagle beds, the coal being known as War Eagle. Some of this coal comes to Hampton Roads, where it is generally used for ships' bunkers, it being lower in volatile than the Thacker coals. It is a coking coal, with a structure somewhat similar to Pocahontas, although harder; it is also an excellent steam coal, especially for locomotive fuel.

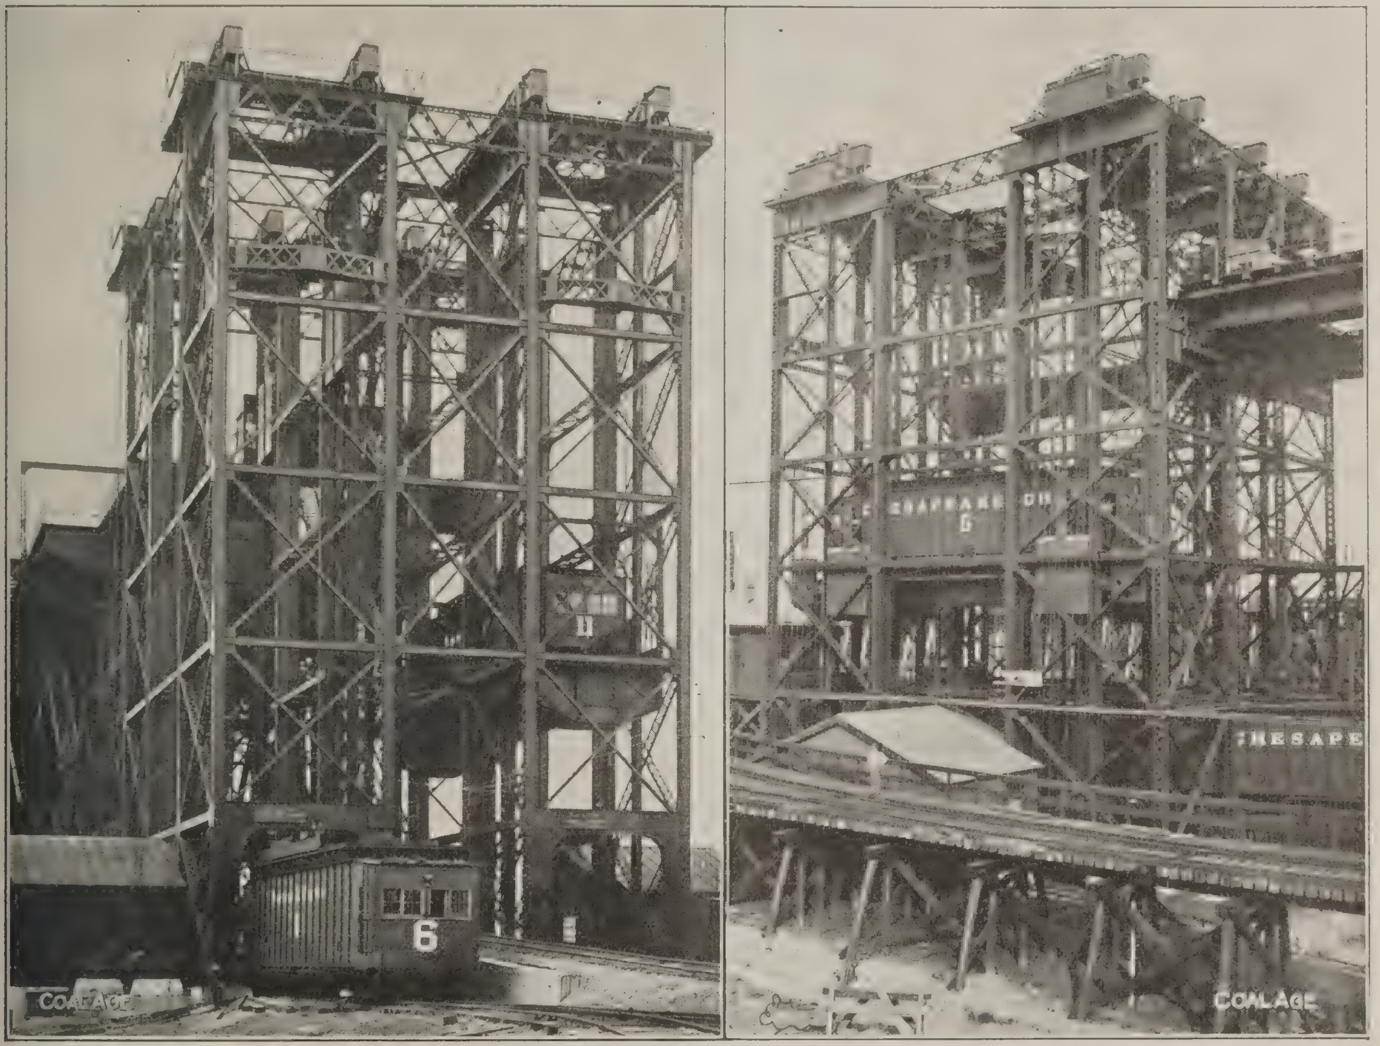
Besides the New River-Pocahontas coals, which make up over 90 per cent. of the Hampton Roads shipments, there is a steadily growing trade in the higher volatile gas and splint coals of West Virginia, Kentucky and Virginia that are shipped over the railroads tributary to Hampton Roads. These are used for gas-making plants, locomotive fuel and also, to a small extent, as bunker coals.

We give below a short general description of these coals as mined along the Norfolk & Western Ry. All of them are found in the Kanawha or Upper Pottsville series, divided into the Lower and Upper Kanawha. The coals of the former are softer and resemble the New River-Pocahontas fuels in structure, while the Upper Kanawha grades are harder splint coals with laminated structure.

Thacker District

The coals from this district, sold under the same trade name, are mined on the Norfolk & Western Ry., and shipped over the Lamberts Point piers. They are usually of a splinty structure, hard and mine out in blocks, standing transportation well and deteriorating little in storage.

They ignite readily, burn with a long bright flame and considerable smoke (under ordinary conditions), have a high ash-fusing point and usually a whitish ash. They are excellent locomotive fuels, good steam coals for general use and for gas producers and furnaces. They are confined principally to West Virginia, but there are several operations whose mines are in Kentucky while their tipples are in West Virginia, the Tug River being the boundary line between the two states.



Shore-End View of the N. & W. Pier No. 4 on the Left and the New Pier of the C. & O. on the Right

The beds of coal mined in this district are:

West Virginia	**Kentucky**
Alma (Local)	Freeburn
Warfield (No. 2 Gas)	Thacker
Thacker	Alma (Elkhorn)
Coalburg	
Winifrede	

Clinch Valley District or Field

The names of the six beds worked are as follows, beginning with the highest:

Edwards
Upper Banner
Lower Banner
Widow Kennedy
Imboden
Jawbone

All of the measures in this field are in the Pottsville group, the Norton formation containing the workable coal beds.

Edwards—This bed is not of much economic importance and its area is limited; the only developments are around Norton, Va. The thickness of the coal is about 4 ft. 5 inches.

Upper Banner—This is the most persistent and valuable bed in the field; it runs from 4 ft. to 7 ft. 10 in. in thickness, with a regular sandstone parting, usually from 1 in. to 3 in. thick; there are frequently two sandstone partings and occasionally one of shale.

The coal is a high-grade bituminous fuel, hard, with cubical fracture, comparatively low ash, low sulphur, burns with a long bright flame, intense heat and not much clinker. It is an excellent coking and gas-coal and one of the best locomotive fuels in the country.

ANALYSES OF CLINCH VALLEY COALS

		No. 2				
Moisture	**No. 1 Dry**	**A Dry**	**B Dry**	**C Dry**	**No. 3 Dry**	**No. 4 Dry**
Volatile	35.17	26.1	26.7	36.3	34.8	33.83
Fixed carbon	58.69	62.7	64.9	56.8	59.3	59.56
Ash	6.14	11.2	8.4	6.87	5.94	6.51
Sulphur	0.576	0.71	0.75	0.69	0.85	0.70
Hydrogen	5.23	......	......	4.13	5.11	5.16
Carbon	81.26	......	......	80.66	81.55	79.57
Nitrogen	1.54	......	......	1.73	1.32	1.50
Oxygen	5.25	......	......	4.92	5.22	6.46
B.t.u	14,567	13,960	14,290	14,330	14,650	14,303

No. 1.—Upper Banner.

No. 2.—Widow Kennedy bed. **A** is a mine sample from the whole bed, 2 ft. 8½ in. **B** is a mine sample from 2 ft. 3⅝ in. of the bed. **C** is a composite of two samples from another mine. All analyses are from U. S. Geological Survey, Bulletin No. 541.

No. 3—Lower Banner bed. Composite of three samples from same mine, clean coal only. U. S. Geological Survey, Bulletin No. 541.

No. 4.—Analysis of the Imboden bed.

The Kennedy Bed—This seam shows great variation in thickness, ranging from 1 to 12 ft. It seems to have been greatly disturbed and in many places it is crushed, and filled with balls and bands of clay, so that its value is greatly decreased. (U. S. G. S. *Bull.* No. 348.)

There is often found in this bed, especially where it thins out, a section of soft, impure, laminated coal, called locally "black rash." This coal, when clean, is of excellent quality, but with a low ash-fusing temperature. Its character as shown by analysis varies somewhat in different parts of the field.

Lower Banner Bed—This bed is not of as much commercial importance as the Upper Banner; it runs from 3½ to 6 ft. thick including partings. There is generally a "black rash" in this bed consisting of layers of bone and coal. The character of the coal is similar to that in the Upper Banner.

Imboden—This is one of the most valuable beds in the region, running from 5 to 10 ft. in thickness. The coal is one of the best coking fuels in the country and an excellent steam coal. Much of it is being used as locomotive fuel.

Jawbone Bed—This coal is not of much importance. It is mainly used for domestic purposes, not being as good a steam fuel as others in the district.

CHESAPEAKE & OHIO RAILWAY

In 1873, the Chesapeake & Ohio Ry. was completed westward through the New River Cañon, linking the waters of the Ohio with those of Chesapeake Bay. New River coal was then shipped east, the first mines in the Sewell Bed having been opened, soon after the completion of the railroad, at the town of Nuttalburg. This place was named after John Nuttall, the pioneer operator, along with Col. Joseph L. Beury and Capt. J. A. McGuffin. About two or three years later, the Fire Creek bed was opened up at the town of Quinnimont. Coals from the Kanawha measures were also shipped east, the Coalburg and Winifrede beds in this field having been opened in 1853-54, the entire production at that time going west by the Kanawha River.

About 60 per cent. of the New River and Kanawha coals going to Hampton Roads, a total of 3,455,114 tons in 1913, is now shipped over this road. The total coal handled last year amounted to 13,111,486 tons, so that the tidewater business is 20 per cent. of the gross shipments, 15 per cent. going east, and 58 per cent. west, with 7 per cent. to other roads.

The Chesapeake & Ohio was originally formed by a consolidation of two companies, in 1867; it extended at that time from Richmond to Covington, Va. In 1873, it was built westward to the Ohio and was reorganized in 1888, when the line to Newport News and the tidewater terminals at that point were first built. It now has a mileage of 2051, the main line proper running from while the Chesapeake & Ohio of Indiana extends from Cincinnati to Newport News, a distance of 654 miles, Cincinnati to Chicago, 283 miles.

New River Coal District to Hampton Roads—The distance from Thurmond, the center of the New River coal district, to Hampton Roads, is 381 miles with a maximum for any of the New River mines to tidewater of 413 miles.

The freight rate on New River coal to Hampton Roads is now $1.40 per gross ton, the zone of this rate extending a distance of 426 miles, and including six miles of Kanawha coals, on the Gauley River. This is a rate of 3.67 mills per ton-mile on 381 miles.

Kanawha Coal Districts to Hampton Roads—The distance from Charleston, about the most central point in the Kanawha field, to Hampton Roads, is 443 miles with a maximum for any of the Kanawha mines of 559 miles.

The freight rate on the Kanawha coals to tidewater is $1.50 per gross or 3.40 mills per ton-mile for 443 miles.

The equipment of the C. & O. Ry. on Apr. 1 of last year was as follows: 824 locomotives, 906 coal cars of 30-ton capacity, 4809 of 40-ton capacity, 599 of 45-ton capacity, 24,985 of 50-ton capacity and 1725 of 70-ton capacity. Trains of 4500 tons each are hauled to Newport News with one locomotive.

The number of mines on this road, according to districts, is as follows: New River field, 105; Kanawha, 167; Kentucky, 38.

Chesapeake & Ohio Terminals on Hampton Roads—The terminal yards at Newport News have a total capacity of 3700 cars, the yard for the new pier holding 368 loads and 390 empties.

Coal Piers—The four old piers at Newport News, the location of all the Chesapeake & Ohio terminals, are all of the incline type. The cars are pushed by locomotives, unloaded through hopper-bottom doors and returned to the yards by gravity.

The new pier No. 9 just put in service is similar to the new Norfolk & Western pier at Lamberts Point, but has two more coal chutes on each side. The slips on the sides are 1200 ft. long, and 225 ft. wide with a minimum of 34 ft. at low water. Each side of the pier has 33 bins, chutes and adjustable spouts.

The capacity of the pier is 5000 tons per hour; the dumpers and elevator have handled 40 cars per hour, each.

Check Doors

By M. D. Cooper*

For ventilating falls or long rooms, the general practice has been to hang a curtain of one or more thicknesses of brattice cloth across the entry to deflect part of the air current into the place where air is needed. In order to facilitate the passage of trips, curtains were cut into strips from 3 to 4 ft. wide, with a consequent loss of efficiency in turning the air current into the place to be ventilated. Moreover, the curtains were easily and quickly torn by passing cars so that their life was short, frequently less than one day.

A more satisfactory method of deflecting a portion of the ventilating current is to be found in the use of check doors, which, while costing more to build and to hang than brattice-cloth curtains, are, nevertheless, more efficient in operation and capable of rendering much longer service. The cost of a new door may be saved if a regular ventilating door that has become worn and leaky at the edges and no longer suitable for its original purpose is used as a check door.

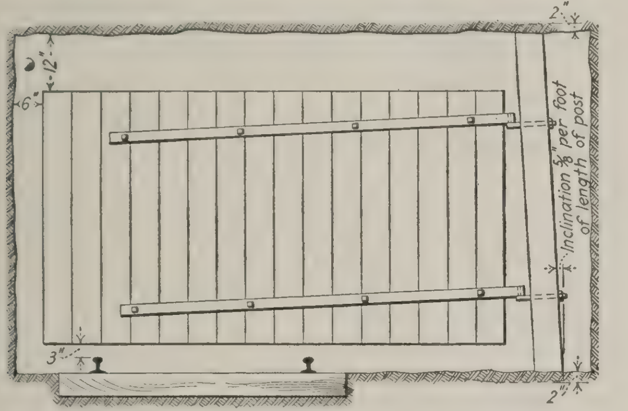


Fig. 1. General Arrangement of Check Door

The general arrangement of a check door is shown in Fig. 1. For supporting the door, a 6x8-in. post may be used. In the roof a rectangular hole the size of the cross-section of the post must be cut about 2 in. deep. A trench the width of the post must be dug in the bottom of the entry, so that the post may be first slipped into the hole in the roof and then slid along the trench to its final position. When in place, the post must be plumb in the direction of the entry while inclined from the vertical across it about ⅝ in. to each foot of length of post, in order that the door may be self-closing.

The door is built of two thicknesses of 1-in. ship-lap, on one side the boards being vertical, on the other horizontal. By using 8-d. nails and bending them over when through the wood, the boards are strongly and tightly joined together. The height and width of the door depend upon the size of the airway. It is best to have the height of the door at least 15 in. less than the height of the entry and the width at least 2 ft. less than the entry's width. When hanging the door, a clearance of 3 in. must be left above the rail to allow for any possible sag; and at the top the clearance must be about 12 in., so that the door will not hit the roof when swung full open.

The straps for hanging the door from the hooks, and the hooks for attaching the door to the post are shown in Fig. 2. The length of straps depends somewhat upon the length of the door, good practice being to make them about 1 ft. less than the length of the door. The straps, of which there must be two for each door, are made of wrought iron, 2 in. wide and ½ in. thick, and are drilled at intervals of 24 in. for ½-in. bolts. It is important to have the bolts of just the right length for fastening the nut after passing through door and strap, for if they are longer, passing cars will catch them, resulting in derailment of cars, weakening of the door, or in wrenching the door from its fastenings. At one end, the strap is bent around in a circle to allow the entrance of the ¾-in. bolt of the hook.

Hooks are made of 1-in. square wrought iron beaten down at one end to a thickness of ¾ in., and drawn out at the other end into cylindrical form to the diameter of a ¾-in. bolt, and then threaded. If a steam hammer is not available it is somewhat cheaper merely to draw the material down for a short distance and then weld a ¾-in. bolt to it. At the heavier end, the piece is punched or drilled for a ¾-in. rod, a 2¾-in. length of which is then welded into the hole. When the hooks are driven into the holes drilled through the post for them, it is only necessary to attach a nut to the upper hook.

This type of check door has proved satisfactory in service. It lasts a reasonable length of time; in fact, it may frequently be used in more than one location before it is necessary to discard it. Moreover, since it may be bumped open by a trip coming from either direction, no time is lost in opening it. As it swings closed of its own weight, it is unnecessary for the trip rider to remain behind to close it.

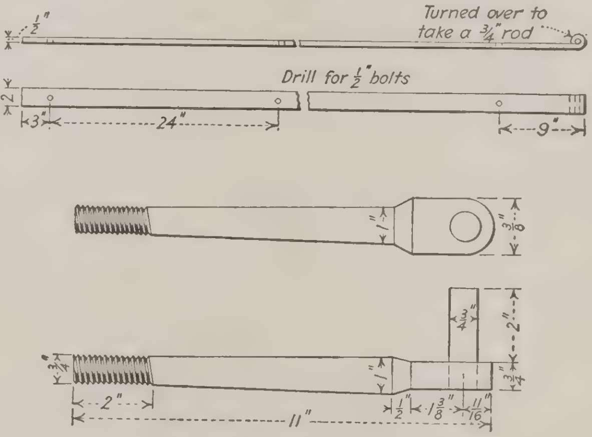

Fig. 2. Details of Check-Door Hinge

⁂

George Otis Smith, director of the U. S. Geological Survey, says: "The ingredients necessary for producing prosperity appear at hand. The new financial system already promises more mobile credits. A more sympathetic attitude of the public toward big industrial operations is indicated. The efficiency of American labor and American engineering was never questioned. In any estimate of American ability to make the most of the present opportunities for industrial expansion, no better measure of the inventive genius of this country can perhaps be found than in a moment's review of of what is making the European war so terrible. Strictly neutral may we be, yet from the heights above to the depths below we find American inventions 'at the front'—the aëroplane, the magazine rifle and machine gun, the barbed wire, and the submarine and its torpedo. Cannot our nation lead as well in fashioning the tools of peace as in designing the machines of war?"

---

*Ellsworth Collieries Co., Ellsworth, Penn.

Extracts from a Superintendent's Diary

I find that the public is always willing and ready to judge a corporation by the acts of its employees, and yet the same public refuses absolutely to judge a corporation by its treatment of, or its instructions to, the same employees.

If a coal-mine superintendent attempts to "lubricate" a railroad man, hoping thereby to get more than his pro-rata share of railroad cars during a car famine, and the railroad man decides to "squeal" (which he has a perfect right to do, and generally does do, as a matter of fact), the public does not stop to question the motive that led the superintendent into attempting so foolish an act, but instead, proceeds to damn the employer, and all other corporations in the same line of business.

If this same company decides, after careful deliberation, to adopt certain advanced ideas in its relations with its employees, be they old-age pensions, profit sharing, liability insurance, or what not, the same public refuses to believe that such acts are prompted by any other motive than a guilty conscience or some hidden selfish scheme.

I have seen the truth of this demonstrated so often that I have arrived at a state of mind where I even hesitate to invoke the loyalty of my men by reminding them that they can only prosper if our company prospers. Such a statement repeated literally by a labor agitator, with emphasis on the word company, satisfies any skeptic that we expect our employees to stop at nothing if they can only assure us of prosperity.

It certainly seems unfortunate that in the industry where coöperation between employer and employee *almost* determines the death rate such a condition has developed. I question if there is as much mistrust displayed in any other industry either from within or without.

We are just now passing through a strike and I am having opportunity to witness the effect of such feeling, as well as the reason for much of the unwarranted mistrust evidenced by the employees toward their employer.

I have always taken a personal interest in the affairs of my men, and as a result, I have often been asked to give advice on all sorts of matters, personal and otherwise. It naturally follows that, I being only a human being, some of my recommendations have not led to satisfactory results, and our union officials, being always on the lookout for arguments against the company and the company heads, have made capital of some of my mistakes in a very effective manner.

It is quite possible that the union officials think they are justified in such tactics, since to them the important thing is to array all employees on their side and "agin" the company.

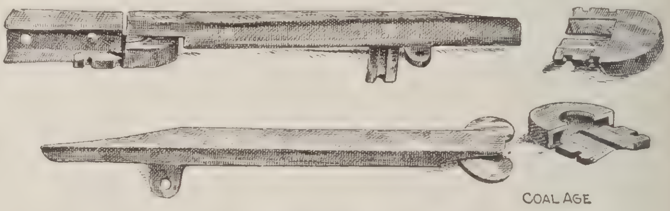
They haven't reached a state of mind yet where they will admit that all of the prejudice they kindle is bound to react against the industry as a whole and especially against the safeguarding of all employees, and so they go on untrammeled in their task of tearing down all that I have endeavored to build up through years of patient personal effort.

In fact, they are making use of many of the things which we learned through experience and experimenting together, to endanger the lives of the men who have refused to be intimidated by their threats.

And my city friends, unable to recall much about my methods except that I advocate the employment of mine guards, when occasion demands, have all but ostracized me, since our labor leader has received the encouragement of a nearby city editor.

A New Switch Point

There has always been more or less trouble with switch points which turn over and derail wagons. But still the old switches, though annoying, occasioned only a short and infrequent delay so long as the equipment was light, but now with greater traveling loads, derailments from this cause are more numerous and less easily corrected. Thus the weight of equipment in two ways has made a cure imperative. This need will be increasingly manifest when storage batteries come more generally into use and heavy locomotives are used in room headings.

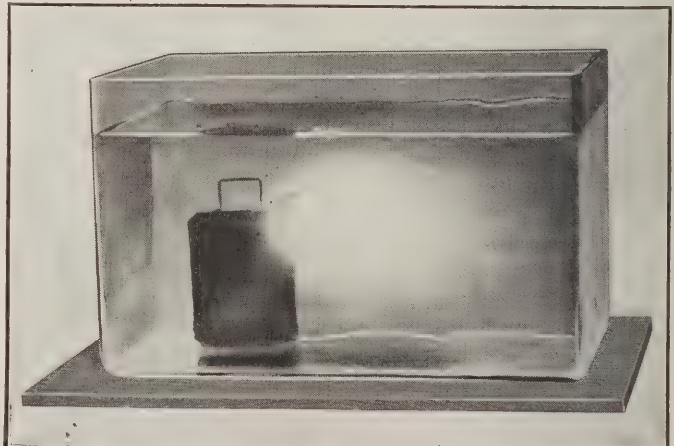


A SWITCH POINT WHICH DOES NOT TURN UNDER A LOAD

As its mode of operation is quite obvious it is hardly necessary to explain the action of the switch of the Clinton Switch Co., Clinton, Ind., illustrated in the figure. The upper right hand view shows the underside of the chair in which the switch point is turned, the lower right-hand view shows the same chair in its natural position, the lower left-hand view showing the switch with the half disk which by its secure fit in the chair prevents the heel of the switch from turning under the load.

Lamp Burns under Water

The Hirsch electric mine lamp shown above was burning continuously under water for 12 hours at the International Exposition of Safety and Sanitation, held in New York City in December. The batteries and reflectors are so constructed that they will burn under water without short-circuiting. This has been demonstrated a number of times where these lamps are used in wet shafts and in wet mines.



The Labor Situation

SYNOPSIS—One of the eastern Ohio mines has started operations on a scale of 58c. for lump and 22c. for slack. In 1914, $1,100,787.59 was spent in relief and benefits by the Union in eastern Ohio. News from West Virginia and Indiana.

During the past week several mines resumed in eastern Ohio on the "open shop" basis. Reports as to the number of miners who are employed at these mines are conflicting, but it is known that coal in limited quantities is being produced at several of the mines in Jefferson and Belmont counties. The Ramsey mine of the Roby-Somers Coal Co., located near Bellaire, was opened with 100 miners, according to the reports of the operators, and with 40 miners, according to the report of the miners' officials.

It is said that 150 tons of coal were produced the first day of operation. The company is paying 58c. for lump and 22c. for slack, which is claimed to be the equivalent of the Pittsburgh scale of 44.61c. on the mine-run basis. No violence occurred at this time, according to reports received by the Ohio Mining Department.

The following companies announce that they will start at least one mine in the near future: The Valley Camp Coal Co., at Fairpoint; The United States Coal Co., at Bradley; The Wheeling & Lake Erie Coal Mining Co., at Dillonvale; Jefferson Coal Co., at Piney Fork; Meister Coal Co., at Flushing, and the Glenn Coal Co., at Deep Run. The announcement is also made that the Rush Run mine of the Glen's Run Coal Co., will be operated as soon as it is placed in shape.

Eastern Ohio Conciliators Are Busy

In the meantime the federal investigators, Hywel Davies and Daniel J. Keefe, have been busy securing data. The first stop of the investigators was at Cleveland, where they interviewed operators. Later they met a special committee of seven representing the eastern Ohio operators at Wheeling, W. Va., which is opposite many of the mines in Ohio. Cincinnati was visited to gain more information as to mining in Ohio, West Virginia and Kentucky. The last place visited was Columbus, where the officials of the Ohio District of the United Mine Workers of America were interviewed. The investigators refused to make any statement for publication and Mr. Keefe contented himself with the following words, "We are simply absorbing information."

The belief is gaining ground in all circles that the real issue at stake is the question of honor of the officials of the miners' organization. When the Hocking Valley and other Ohio districts signed up at 47c., a promise was given that no other district in the state would be signed up at a lower rate. Now, in spite of the fact that many of the rank and file of the miners' organization are willing to return to work at 44.61c., the officials have steadily refused to allow a referendum vote.

District Convention of Union in Ohio

Another important event during the week was the annual meeting of the Ohio District of the United Mine Workers at Columbus, which consumed several days. A resolution was adopted continuing the strike in eastern Ohio indefinitely, and the statement was made that since the settlement of the Colorado strike, the finances of the organization could amply provide strike benefits in eastern Ohio.

Plans for the eviction of miners from the houses of the operators were not discussed at the meeting, it being explained that those matters were in the hands of the counsel for the miners in the various mining localities. Officials of the union specifically cautioned the men against any violence and the absence of violations of the law in the past was commented on by a resolution.

The financial report of Secretary-Treasurer Savage showed a surplus of $28,125.24, Dec. 31, 1914, as compared with $263,816.57 the year previous. The report showed that the sum of $1,100,787.59 was spent in relief and benefits during the year 1914.

West Virginia and Indiana Unions

The secretary-treasurer, James M. Z. Craigo, of District No. 17, United Mine Workers of America, reports an increase in paid-up membership since March 31, 1912, from 1667 to 7175. This district covers the unionized parts of West Virginia.

In the Indiana "bituminous-coal" district, known as No. 11, the returns of the recent election of union officials have been received. Edward Stewart, of Hymera, Ind., is elected president. The former president, W. D. Van Horn, is elected international board member. William Mitch, of Terre Haute, is elected secretary. The board members are: W. H. Ramey, of Princeton, reëlected, first district; Harry Pigg, of Jasonville, reëlected, second district; John Hessler, Hymera, third district and Peter Donie, West Terre Haute, reëlected, fourth district.

Receivership for the Josiah V. Thompson Properties

Tuesday morning, Jan. 19, the Common Pleas Court, at Uniontown, Penn., appointed receivers for the properties of Josiah V. Thompson, who has been very prominent for years as a heavy buyer of coal acreage, particularly in Greene County, representing the extension across the Monongahela River of the Connellsville coking-coal seam. Mr. Thompson's acquisitions began 15 years or more ago, in the Klondike or lower Connellsville region, and when this acreage was all taken up, he turned his attention to Greene County, in the belief that as the steel industry grew it would have to base the increased coke supply needed upon Greene County coal. The steel industry has expanded in recent years less rapidly than was expected, and has turned its attention almost entirely to byproduct coking, pursuing at the same time the theory that it was better to invest money in a byproduct coking plant than in coal acreage, as byproduct ovens can draw from a variety of sources, and depend more or less upon the current market supply of coal.

The receivers appointed are Andrew Thompson, a son, William G. Laidlaw, a business associate, and J. P. Brennan, president of the Thompson-Connellsville Coke Co., which Mr. Thompson formed some years ago to develop a part of his Klondike acreage. The receivership was upon a friendly petition brought by two large unsecured creditors. The petition stated that Mr. Thompson had unsecured creditors to the extent of $7,000,000 and creditors to the extent of $15,000,000 secured by mortgages and collateral. The value of his holdings was stated at $70,000,000. It is popularly supposed that Mr. Thompson was interested altogether in about 200,000 acres of coal. The receivership was precipitated by the closing of the First National Bank of Uniontown, of which Mr. Thompson was president.

The Crisis in South America

Seldom before have the states of South America shown less buying power than at present. It would be an error to attribute this widespread crisis to the war, as the bad times were to be seen plainly at the beginning of 1914. For illustration, the imports to the Argentines during the first quarter of 1914 fell to 171 million dollars, a decrease of 31 million. The exports, likewise, reached 213 million only, a loss of 38 per cent. from the corresponding period of the year before.

The customs entries of Brazil, also, are even worse than had been feared. The duties of the port of Rio de Janeiro, from the first of January to Aug. 30, 1914, show a total decline of 40 per cent. from the same period of 1913, the loss increasing steadily from 20 per cent. in January to 42 per cent. in July and 57½ per cent. in August. In fact, this loss in trade exceeds that experienced by some of the countries actually at war.

Note—From the "Frankfurter Zeitung." Translated by H. B. Binsse.

Editorials

Ten Months or More without Rent

We must credit the eastern Ohio operators with much patience, seeing they have permitted the men to live in the company houses for ten long months without paying any rent, while these same men were trying to coerce their employers into conceding them an increased wage.

It contrasts unfavorably with the plan the miners have at Gillespie, Ill. When you trade at the coöperative stores you are allowed credit within $10 of your capital invested—a safe and sane provision. If the eastern Ohio operators had followed it, the miners would have already spent nearly a year in dugouts and tents.

It appears, however, that the miners' union is convinced that the operators should donate the residences in perpetuity to their former employees, or at least is endeavoring to see if the courts of Ohio will not rule that the operators have only reversionary rights to the tenaments when the present occupants no longer desire to occupy them.

In fact, sometimes, we think the miners and the public confuse the Golden Rule with the Double Standard.

The Long-Service Man

Among the letters we have received on "Who Gets the Promotion" is one from a former resident of Great Britain, judging by all the many earmarks—the name, the ruled margin on the left side of the page, the careful essay-like appearance of the script, the use of the letter "u" in words like labor, and, above all, the viewpoint. He is in favor of the "Long-Service Man."

It may be stated fairly that perhaps only in the United States would the "popular" man have so many advocates as have registered their appreciation of him in this contest. It is true that he has all the advantage in the competition, as our readers have pointed out. Still perhaps in few countries but ours would he get the majority or at least a vote so overwhelmingly in his favor.

The Englishman looks almost with horror at the indifferent and almost contemptuous manner with which we cashier men who have been long in the service. It is nearly always customary in older countries to give a period as they term it of preliminary "warning" during which another berth can be sought though probably not secured.

Yet after all, our apparent lack of proper sentiment carries with it no particular hardship and works no wrong just because it is so common. In many cases, as our readers will remember, a man who is discharged is only "fired upstairs." He only finds, if he is the right kind of man, a better and more responsible position. To many men it may be said, fate has been unkind. They have clung like barnacles to a barren rock where food is scant and no kindly wave has set them free.

In Europe, however, where changes in personnel are rare, the man who is cashiered is looked on with suspicion, and he must usually start again at the bottom, for all the train of long-service men in another corporation is before him; he cannot elbow his way to the head of the queue. He has been cruelly wronged, whereas in America perhaps he would only have been ruthlessly helped.

Besides, the position of the European has been gained by influence. Even the most modest are sometimes so attained, and few men have more than a single wire to pull. This does not mark the applicant as a man without merit. Not at all; most men make their start in just that way. It is clear, therefore, that because the fall from the precipice over which "Long Service" is pushed is too great for the resilience of his bones is the very reason why that displacement is so rarely attempted. What may be a benevolence in America would be brutality abroad.

It is to be hoped that we shall always accept in a fair degree the doctrine of the advancement of the fittest, for it really works little harm and often gives the man thus cast adrift a chance to vary his experience and broaden his viewpoint. The jar also sometimes sets his brain to working.

The Grouch

It was a German and a technical man, among others, who selected the student and regarded as excusable the grouchiness of the applicant's disposition. He argues quite reasonably on the value of knowledge.

We were glad to see that he put his stress on the *value* and *advantages* rather than on the *rights* of learning. For we have never been able to see that learning has any rights other than those of utility. There are some who appear to believe in a certain fit reward for the professional man. He has expended so much money, he has labored so diligently, he has sacrificed so much happiness, and surely his reward should be considerable.

The dervishes of India have a similar claim, but one we should find it hard to admit. In fact, knowledge is only worth what it can effect. It is the service of the knowing and not their sacrifice for which we are willing to pay. By dint of study you may learn the value of pi to twenty places, that the sine of 1 deg. is 0.0174524, and that the logarithm of two on the base ten is 0.3010300 and other interesting facts, but if they will not enable you to do your work better than it can be done by a man with tables, if the facts crowd out of your mind, for instance, the wage scale you are paying your men, it is no better knowledge for you than the classics. In fact, the latter is to be preferred, for it may broaden your viewpoint, which cramming of mere figures never will.

We think this discussion on the three applicants for promotion will be valuable if it is a victory for sanity. A man may cram himself with facts till he becomes sickly and ill-tempered and loses the very reward for which he was striving. It does not profit a workingman to work longer hours or harder than his constitution will stand, nor does it pay a brain worker to put his uttermost into his work.

We have heard too often about a man doing his best. He should do that and not less. But he has body, mind and spirit, and it is merely a folly if he ruins any of the three, thinking that doing his best is promoting the interests of one to the annihilation of the others. Too many New Year's intentions are tinctured with just such folly.

Let them say rather of us that we are well knit men, neither all mind, nor all spirit nor all physical perfection, but every inch of us men. Because of such qualities we see men progressing who never made any visible sacrifices. In fact, they surrendered nothing but their vices and their follies, all their aims which did not lead to the goal and all the studies which did not aid in a solution of the problems of life.

Those little men who follow up the unessentials, who sacrifice themselves for things not worth while, will wreck their employers' industry on similar profitless purposes. The man who will give time and money to solving some purely theoretic problem is quite likely to exhaust the capital of the company in some intellectual mare's nest. And the man who seeks all his knowledge in books is lost if he cannot light on a slip of paper which will resolve his difficulties for him.

There is abundant room for the student, but he must not and need not be a grouch. He need not lose his cheerfulness of mind if he will only keep in view the fact that his manliness is the best part of him, and that what he achieves is beyond comparison more important than what he reads or has read. And he will not be suspicious and grouchy if he only realizes, as men of the workaday world do, that the best of men do not know everything, but fall occasionally into errors.

The popular man is probably well liked because he is "like other men but more so." He is what the consensus of men generally believe is normal and has some genius to boot. The scholar is often like the beauty with a harelip or a blind eye; he has all the excellencies you may desire but one, and the deficiency is so glaring as to overpower all the advantages.

There are no schools for character; no expensive advertising campaign has backed its development. Nevertheless it is as important as knowledge. Many a man who hopes to be paid because he has burned his eyes over books would have earned equal advancement had he taken a brisk walk and kept his eyes open to what was happening around him.

Workmen's Compensation and Miners' Check-off in Illinois

In connection with the request of mine employees of the State of Illinois for a revision of the Workmen's Compensation Act, which has now been operating for about two years, they ask for full compensation for all time lost on a basis of their regular earnings when idle as a result of personal injuries. The Illinois Coal Operators' Association has appointed a committee to consider this proposed revision of the law from the standpoint of the coal operator, and Carl Scholz, a member of this committee, has prepared some figures (which are remarkable in a way) showing amounts paid by the Illinois mines to the United Mine Workers of America by means of the so called "check-off," or deductions made on the mine payrolls from earnings of employees and paid to the Union.

Figures obtained from 14 representative coal companies in Illinois show that on a basis of tonnage produced in the state during the year 1914, approximately $2,000,000 was paid into the treasury of the miners' organization, or at the rate of about $26.50 per annum for each man employed. This is at the rate of 3½c. per ton for every ton of coal produced in the State of Illinois during the year 1914. The operators are going to maintain that if mine employees can afford to pay $26.50 each per annum for the insurance of wage conditions and to protect contracts in effect with their employers, they should be willing to pay a substantial sum into a compensation fund under the control of the state to insure themselves and their families in case of accident.

It is a well established fact that the larger proportion of the amounts collected by the Union in the State of Illinois has been used to carry on strikes of the National Organization, not only in Illinois but in adjoining states. Mr. Scholz feels that these figures portray impressively a situation with which the public generally is not familiar.

The table which follows shows the tonnage produced and amount of check-off paid by 14 representative coal companies in Illinois during the year 1914.

STATEMENT SHOWING TONNAGE PRODUCED AND AMOUNT OF CHECK-OFF BY VARIOUS ILLIONIS COMPANIES FOR 1914

	1914	
	Tonnage	Check-Off
Chicago & Carterville Coal Co.	442,480	$18,374.02
Coal Valley Mining Co.	211,764	8,687.34
Dering Coal Co.	714,603	31,955.79
Jones & Adams Coal Co.	479,323	13,057.14
Old Ben Mining Corporation	1,153,967	32,776.38
Peabody Coal Co.	3,283,000	106,869.65
W. P. Rend Coal & Coke Co.	425,960	19,677.18
W. P. Rend Collieries Co.	322,667	17,868.14
Saline County Coal Co.	1,096,927	30,944.71
Sessor Coal Co.	563,127	23,786.86
Sunnyside Coal Co.	309,536	10,214.95
Thomson & Burton Co.	299,696	17,900.40
O'Gara Coal Co.	2,038,252	76,276.59
	11,341,302	$408,389.15
Cost per ton		0.036

This Will Interest You

Although we publish 40 or more pages of editorial matter every week in COAL AGE, it seems that when we close each issue of our paper we have only succeeded in printing a few of the articles we had hoped to get in. A large number of our pages this week were necessarily given over to a discussion of the cartoon—Who Gets the Promotion? We are certain, however, that the evident interest in the question justified us in devoting so much space to it.

For next week, and several succeeding issues, we have the following interesting articles: "Drying Washed Coal," "A British View of Our Export Trade," "Wage Scales in Various Fields," "Mine Tracks in Coal Mines," "Rating Mine Locomotives," "Electrically Driven Longwall Coal Cutters," "Triangulation from Two Plumb Wires," "Electric-Arc Welding in Mine Repair Shops," "Electric Power—Its Generation and Transmission," "Driving Rock Tunnels in Coal Mines," "Reopening a Mine That Has Been on Fire," "A Tipple Equipment for Handling a Small Tonnage," "Signal Wires in Mines," "The New Plant of the Main Island Creek Coal Co. in West Virginia," "A Coal Conveyor and Loader System for Thin Seams," "Shipping Coal Through the Panama Canal," "How to Build Concrete Stoppings," "Electric Shot-Firing," "Underground Fans," "Rescue Station, Organization and Costs," "Operating a Mine with a Conveyor System," "A New Shortwall Mining Method," etc.

Discussion By Readers

Mining Laws, Legislation and Mine Regulations

Letter No. 21—In one of the recent letters discussing the question of proper mining laws and speaking of the examination papers of candidates for mine foreman, fireboss and assistant mine foreman not being returned to them, after the examination, I notice that one contributor says that the "examining boards are not instructors," which seems to imply that the papers should not be returned to candidates, because the corrections made on them by the examiners might not be accurate and would do the candidate more harm than good.

In my opinion, every candidate in examination has a right to the return of his papers properly marked as *correct, imperfect,* or *wrong,* as the case may be. This will enable the candidate to determine exactly his weak points. It would induce further study and promote education.

FRANK RUSCHEL.

Ellsworth, Penn.

Letter No. 22—Permit me to add a few words to the interesting discussion of the mine-law problem. In my opinion, our mining laws are stringent enough, especially here in Tennessee, although there are a few points that undoubtedly should be amended. I believe the law should be broadened, in many instances, to give the mine inspector more power to properly administer those laws that are already on the statute books.

Instances showing this necessity have frequently come under my observation. For example, a certain mine foreman, whose duty it is under the law to visit each and every working place once each day that the mine is running, fails to visit these working places oftener than once in two weeks. In some cases, he does not visit the inside workings except on the last day of the month, when he goes there to measure up the work.

In one case that I have in mind, the foreman acts both as mine foreman and superintendent, over a line of work extending a distance of 5 or 6 miles. This man has, legally, no assistant, although he employs a man who does not hold a certificate to act in that capacity. When the mine inspector visits the mine, this so called "assistant" acts as "boss driver."

Under such working conditions, it needs no argument to prove that were a miner known to report to the mine inspector the actual conditions existing in the mine in his absence, he would be summarily discharged. I could mention several places where it is the constant effort of the mine foreman and his assistants to hoodwink or fool the mine inspector when he visits the mine. It is not always the mine inspector's fault that he is deceived by the misrepresentations of these men.

As a rule, mine inspectors have too large a territory in their charge and are unable to give the time required for a thorough inspection of each mine. They must depend, to a considerable extent, on the statements of the foreman and the men. It is too often the case that the latter are afraid to make any statements of unfavorable conditions to the mine inspector, fearing the natural result should such disclosures become known. It is even true that some operating companies will discharge a mine foreman who continues to contend for what is lawful and urgently needed in the mine to safeguard the lives of the men in his charge.

Only a short time ago, in conversation with a general manager of a mine, I mentioned the fact that the air in his mine was such that the men were able to work only a part of each day. In response to my question as to whether he was not afraid that the mine inspector would require a better circulation of the air to comply with the mining law, this manager replied with an oath that he was running his mine and no inspector could do it for him. The foreman in charge of this mine made the statement, a little later, that as far as the law was concerned it was an easy matter to close one or two doors, hang a few sheets and boom the furnace sufficiently to show the necessary circulation of air at the points where the inspector would take his measurements, which would avoid any trouble with him. Being personally acquainted with the inspector, in this case, I am convinced that he has been fooled many times when making the inspection of that mine.

The remedy I would suggest to meet this condition is to enact a law authorizing the inspector to require of every mine foreman and assistant a sworn statement of the actual condition of the mine during the interval between his successive visits. In my opinion, the inspector should also have the power to call certain miners from the mine and demand of them a similar sworn statement of the condition of the mine in their working places during the same interval of time. By this means, the inspector should be able to determine whether or not the mine foreman and his assistants were faithfully discharging their duties as required by law. As a result, I believe there would be fewer mine accidents. Not only would such an amendment to the law be a benefit to the men, but the companies would likewise be benefited by a reduction in the number of accidents, greater economy of operation and an increased output of coal.

I would suggest that another point in which the mine law of Tennessee could be improved is to so amend the law that no mine foreman shall be employed in any mine working over 20 men, unless he holds a "Class A certificate." By the present Tennessee law, Class A certificates are required only in mines generating gas or known as dusty mines; while it is well known that gas is liable to be generated at any time, in *all* mines. Should that occur in a mine where a second- or third-grade foreman has charge, who has not the necessary knowledge of mine gases, a disastrous explosion might easily result. Furthermore, such a foreman knows little or nothing of the use of a safety lamp and would not be able to detect the presence of gas should it occur in the mine. As a consequence, some miner may be burned to death or another mine disaster go down in history.

The necessity of requiring a sworn statement of all mine officials is shown by another instance of a mine foreman who held a first-class certificate and whose duty it was to inspect the workings before the men went into the mine in the morning. This man had 4 mi. to walk to the mine; and, in reply to my remark that the work was hard for him to accomplish, he said: "I never go through the mine further than the furnace, where I stir up the fire and come back to the outside." I said, "You do not need then to carry a lamp." He replied, "No, but it helps to fool the men and make them think I have been over the mine." He said that he had little gas in the mine. I believe that a sworn statement would eliminate such flagrant breaches of the mine law.

There are many honest, conscientious mine foremen whose word can be taken at all times. Such men are safe whether they hold a certificate or not, because they have the safety and interests of every mine worker at heart. On the other hand, the falsity of other men to the trust imposed in them makes it necessary to demand of *all* a sworn statement. The employment of men, farm hands and others, who have no knowledge whatever of mining and setting them to work in the mine to dig coal is a dangerous practice and should be prohibited by the mining law of every state. Such a worker, not long ago, drilled an 8-ft. hole, at the head of an entry, in a mine generating some gas, and charged this hole with 50 in. of black powder.

As I have previously stated, the best way to prevent these dangers is to give the mine inspector greater power and to require sworn statements on the part of mine officials. Mine operators and foremen should not think, for a moment, that any legislation that tends to safeguard the men in their charge is an added burden. The result will show to the contrary. For my part, I have always been willing for an inspector to slip in and examine my work and offer any needed criticisms. I believe every conscientious foreman will gladly welcome all the assistance he can have in making things safe in and about the mine in his charge. By this means he is better able to bear the responsibility resting on him.

A. H. STANSBERRY.

Loading Coal by Machinery at the Face

Letter No. 3—Referring to the inquiry of John Harvey, COAL AGE, Dec. 5, p. 920, and assuming that he has reference to the use of a chain conveyor such as is frequently used on a longwall face, in working a thin seam of coal, I would say that the scraper line used for this purpose and patented by Clarence Claghorn has been successfully operated, in many mines, both in this country and in England. There are, besides, many other similar machines used for the same purpose.

I would say that such machines are particularly adapted to longwall work. I could not recommend the longwall system for the working of the seam described by Mr. Harvey. My own experience, in this section and seam of coal, inclines me to believe that the longwall system would not be practicable in this case. While I realize the longwall method has been used with much success in certain sections, I am not favorably inclined to its adoption. The disadvantages of such a system, briefly stated, are as follows: 1. Experienced miners or men familar with longwall work are required. 2. It is impossible to isolate any section of the mine where gas may be encountered, and to control the ventilation as conditions may demand. 3. Much labor must be expended in building packwalls for the support of the roof. 4. The method is impracticable where periods of enforced idleness are unavoidable, or where faults exist in the measures.

In the working of low coal, I prefer a double-entry system and a method of working that will permit the use of shortwall machines. I would turn the rooms at right angles to the entries, on 50-ft. centers, driving them 30 ft. wide and leaving 20-ft. pillars between them. The machine should cut the rooms up one entry and down the other. This method affords a greater concentration of the work; and if two men work together in two adjoining rooms, cleaning up one room while the machine is cutting the other, there is little delay, and the wear and tear on the machine, owing to many moves, are decreased to a minimum.

I have used the shortwall Sullivan coal cutter and find it adapted to the cutting of hard coal. This machine is provided with the chain haul, for cutting across the face of a breast. The plan of working two men together in two roms, alternating between the rooms, will be found to be a great advantage and cause less delay both in cutting and loading the coal. Otherwise, two or three places will be cleaned up at the same time and the men often obliged to go home to wait for a new cut to be made in their room.

WM. H. EASH, Mine Foreman,
Wentz Smokeless Coal Co.

Hollsopple, Penn.

Drying Washed Coal

Letter No. 3—In reply to John Hammond, COAL AGE, Nov. 28, p. 879, who asks if soft bituminous coal can be successfully washed and then dried to contain only 3 per cent. of moisture, permit me to state that, by the use of a centrifugal drier, the moisture content in the washed coal may be reduced to about 7½ per cent.; and it has been our experience, particularly in one plant where the dried coal is delivered to a system of conveyor belts and taken by them directly to the byproduct coke ovens, in the passage of the coal over the conveying-belt system where it is dropped from one belt to the other, during warm weather there is a further loss of moisture amounting to perhaps 1 or 1½ per cent. by the time it reaches the coke ovens. I believe, therefore, that if Mr. Hammond would use one of these driers to reduce the moisture down to, perhaps, 7 or 8 per cent., it would be entirely feasible to take this dry coal and handle it over a belt conveyor that would discharge at a point where a current of hot air would pass through the coal. This would unquestionably reduce the moisture very considerably, and it would probably be possible to approximate the 3 per cent. required.

It is my understanding that the 3 per cent. referred to is external moisture. We have at times in these machines reduced the external moisture to that point; but such a low moisture total is not to be depended upon and does not represent general practice. The only way that it could be secured would be with some such plan as we have suggested above.

In the use of the centrifugal drier there are required no elevators, belts or driving chains of any kind; and, in every way, this makes the simplest and most easily operated and attended coal-washing plant that we know anything about. The jigs, driers and pumps are all driven by individual motors; and, in our opinion, this system represents the best practice that has been developed in the washing of coal.

Mixtures of Air and Mine Gases

I have been very much interested in the recent references to mine gases, appearing in answer to an inquiry, Dec. 19, p. 998, and an examination question, Jan. 2, p. 30. I suppose that these questions and answers are published for the purpose of giving readers and particularly miners a knowledge of how such gaseous mixtures affect the life and health of those coming in contact with them and how their presence can be detected by observing the appearance of the flame of a safety lamp, and I am sure this will be appreciated by all concerned.

I notice, however, that all of the calculations are here made on the assumption that the different mixtures have been formed by adding the harmful gases to pure air. It appears to me that this assumption does not represent the conditions in which these gases often occur in the mines. Especially is this the case in respect to carbon dioxide. I understand this gas, to a large extent, is generated in mines, by the breathing of men and animals, by all forms of combustion constantly taking place, and by the decomposition of vegetable and organic matter, etc.

Now, the oxygen necessary to form this gas has been taken from the mine air; and, as a result, the free oxygen remaining in the air will be much less; and the effect on the safety lamp and on the health and life of the miners, for the same percentage of carbon dioxide present, will be quite different to what it would be if we assume that the carbon dioxide has been added to pure air.

For example, suppose the mixture has been formed by adding carbon dioxide to pure air until it contained 12 per cent. of that gas. The mixture would then contain 18.39 per cent. oxygen, 69.61 per cent. nitrogen and 12 per cent. carbon dioxide. Again, suppose the air in the mine contains 12 per cent. carbon dioxide, which has been formed by the breathing of men and animals and the different forms of combustion taking place in the mine, whereby the free oxygen content of the mine air has been reduced. Under these conditions, may I ask, could a man live or would a safety lamp continue to burn?

Estimating the atmospheric air as containing 79.1 per cent. nitrogen and 20.9 per cent. oxygen, and assuming that 8 per cent. of this oxygen is extracted from the mine air to form the 12 per cent. carbon dioxide, the air remaining in the mine would contain 20.9 — 8 = 12.9 per cent. oxygen and 100 — 12.9 = 87.1 per cent. nitrogen; and, as the carbon dioxide is generated, it would again change the composition of the mine air by mixing with it. This change I should judge would produce a mixture as follows: Nitrogen, 76.65; oxygen, 11.35; carbon dioxide, 12 per cent. This shows the oxygen in the air is reduced 18.39 — 11.35 = 7.04 per cent. I should very much like to know if this represents, approximately, the difference between adding carbon dioxide to pure air till 12 per cent. is present, and what would result if the carbon dioxide is formed by consuming the oxygen of the air, as under ordinary mining conditions.

The answers to which I have referred make it appear that the flame of a lamp and animal life can be sustained in much higher percentages of carbon dioxide than I had supposed possible. Dr. J. S. Haldane, in his flame test for oxygen, states that the light of a candle or lamp is diminished 30 per cent. by a decrease of 1 per cent. in the oxygen content of the air. This would seem to imply that a lamp would be extinguished when the oxygen content was decreased $3\frac{1}{3}$ per cent.

I have also noticed that W. Simon, in his "Manual of Chemistry," states that, in air containing 0.5 per cent. carbon dioxide, most persons are attacked by headache, and air containing 8 per cent. of carbon dioxide causes death in a few minutes. Dr. J. Harger has stated that with a reduction of 1 or 2 per cent. in oxygen with an addition of from $\frac{1}{2}$ to $\frac{3}{4}$ per cent. of carbon dioxide, firedamp and coal-dust explosions cannot occur. I have always made it a rule to demand more pure air whenever a safety lamp fails to burn freely. While it is instructive to know just how certain percentages of gas affect combustion and the health and life of miners, I think if we insist on getting enough air to make a safety lamp burn all right we will not be far wrong, except in respect to carbon monoxide.

Rees H. Beddow,
State Mine Inspector.
Gallup, N. M.

[Correspondent has raised an interesting and important question in relation to the *frequent but not general* depletion of the oxygen in mine air. This depletion of oxygen only occurs in poorly ventilated places that cannot be taken as representing "ordinary mining conditions." Whenever ventilation is "good" or "fair," depletion of oxygen cannot occur, owing to the constant replenishing of air in quantities far in excess of what is required for the ordinary forms of combustion in mines.

Correspondent's estimation of the composition of a residual atmosphere containing 12 per cent. of carbon dioxide is incorrect, however; and we are answering his inquiry in regard to this, on p. 178, of this issue.

According to the experiments of Drs. J. S. Haldane and T. L. Llewellyn to determine the effect of the diminution of oxygen on the flame of a lamp burning in otherwise pure air (*Trans.*, I. M. E., Vol. 44, p. 267), the intensity of the light diminished at an average rate of 100 ÷ 2.92 = 34.2 per cent., for each per cent. of diminution of oxygen; or 3.42 per cent. of light, for each 0.1 per cent. loss of oxygen. This would result in complete extinction of light when the loss in oxygen was 100 ÷ 34.2 = 2.9 per cent. The oxygen remaining in the air at the moment of extinction of the light is then 20.9 — 2.9 = 18 per cent. As these authorities state, however, the light can still be maintained, for a time, by raising the wick, which is done in practice, so that actual extinction then occurs only when the oxygen content has reached 16.4 per cent. (Clowes).

The statement that "air containing 8 per cent. of carbon dioxide causes death in a few minutes" is indefinite, because the percentage of available oxygen is not given. If the carbon dioxide has taken its oxygen from the air the result is a "residual atmosphere"; but if the carbon dioxide has been added to pure air the result is an "artificial atmosphere." These two atmospheres are quite different, though containing the same percentage of carbon dioxide. Their composition, together with that of a fatal artificial atmosphere, is as follows:

	O	N	CO_2
Residual atmosphere	12.90	79.10	8.00
Artificial atmosphere	19.23	72.77	8.00
Artificial atmosphere (fatal)	17.14	64.86	18.00

It may be assumed, with some assurance, that while an *artificial* atmosphere containing 8 per cent. of carbon dioxide is not fatal to life, a *residual* atmosphere containing the same percentage of that gas would be fatal, in most cases, owing to the greater depletion of the oxygen. When no carbon dioxide is present, however, the oxygen content of the air can be reduced, in most cases, to 10 per cent., before fatal results are obtained.—Editor.]

Ventilation of Gob Areas

Letter No. 1—I wish to correct the statement of J. W. Starks, in regard to the character of the gas found in the sealed portions of Mine No. 11 of the Dering Coal Co. This area was reopened Aug. 14, 1913, for the purpose of removing the gas that had accumulated therein during the six years it had been sealed. The removal of this gas occupied six days, before the place could be considered safe.

Mr. Starks states, Coal Age, Dec. 5, p. 908, that "A pipe leading from this area showed that the gas had finally been rendered harmless by blackdamp." To show that this was not the case, permit me to say that the exploring parties were able to get a "cap" within two feet of the bottom of the cage landing; while, on the third day after opening the sealed area, the gas was so strong that a test with a safety lamp showed a "cap" at the surface landing.

These facts showed clearly that the gas had not "been rendered harmless." I would be glad to see in the columns of Coal Age, the opinions of different Franklin County operators and superintendents, giving their experience in this line and stating whether or not it is advisable, in the Franklin County field, to open old and sealed territories.

Further verification of the above statement can be had by reference to Frank Rosbottom, ex-state mine inspector; Edward Laughlin, county mine inspector; J. C. Duncan, ex-supt., Benton Mine Rescue Station; or R. M. Medill, supt. of the Dering Coal Co. All of these gentlemen were with the exploring party.

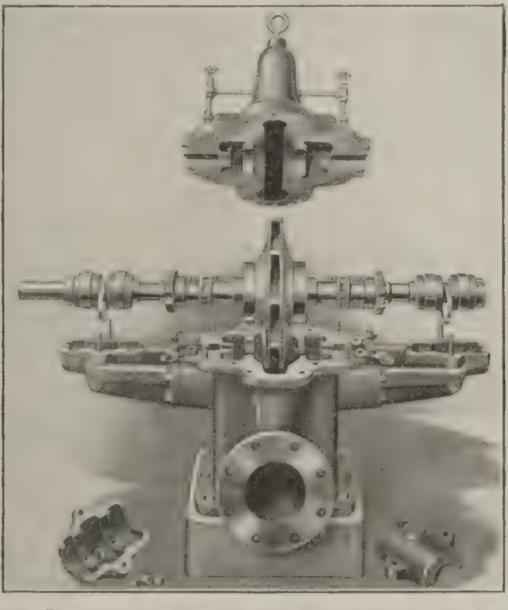
Study Course in Coal Mining

By J. T. Beard

The Coal Age Pocket Book

Principle of the Centrifugal Pump—The action of this class of pumps depends upon the centrifugal force generated by the rotation of the water passing through the pump by the mpeller. The force so generated acts radially outward, causng the water to flow from the center toward the circumference, and imparting to it the energy of the motor transmitted through the shaft and the curved blades or surfaces of the impeller. The design is to convert as much of this mechanical energy as possible into kinetic energy in the water lowing through the pump; and, then, by gradually enlarging he area of passage and thereby reducing the velocity of the water, to increase the pressure to equal the resisting head.



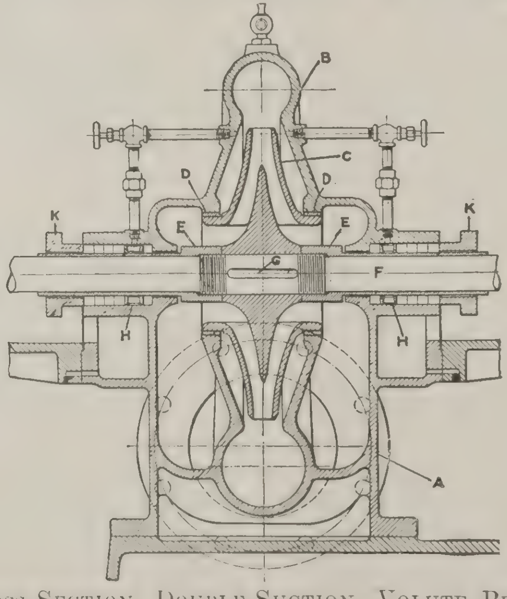
Cover Removed, Showing Interior of Pump

The above figure shows a centrifugal pump with the upper asing lifted, so as to expose to view the interior construcion. The shaft carrying the impeller is also raised out of ts bearings, for the same purpose.

The Coal Age Pocket Book

The impeller, which is known as the "inclosed type," is securely keyed to the shaft by which it is revolved at a high speed. Both the suction and the discharge openings of the pump are in the lower half of the casing, which leaves the upper half free to be removed without disconnecting the pump.

The water entering the suction end passes at once to the annular space surrounding the shaft, on each side of the pump, and thence through the radially curved passages of the impeller, to the volute space in the casing surrounding the wheel. The area of passage through the impeller and the volute casing is gradually and uniformly expanded so as to convert velocity into the pressure necessary to discharge the water against the given head.



Cross-Section, Double-Suction, Volute Pump

The cross-section shown above makes clear the relation of the several parts, which are as follows: Upper casing, A; lower casing, B; impeller, C; bushing rings, D; shaft sleeves, E; shaft, F; impeller key, G; water seal, H; stuffing-box glands, K.

Inquiries of General Interest

Calculation of a Residual Atmosphere

Will you kindly show the calculation of the composition of the atmosphere represented by mixture No. 4, given in the inquiry, Coal Age, Dec. 19, p. 998. This mixture contains air, 80 per cent.; methane, 8 per cent.; and carbon dioxide, 12 per cent. What I want to know is how to calculate the percentage of oxygen and nitrogen, respectively, assuming that the carbon dioxide in this mixture has been formed by taking its oxygen from the air contained therein.

R. H. B.

Gallup, N. M.

The first step is to observe that, in the formation of carbon dioxide (CO_2), the volume of oxygen consumed is equal to that of the carbon dioxide formed. Since 100 vol. of this mixture contains 12 vol. of carbon dioxide and 80 vol. of air from which 12 vol. of oxygen has been taken to form the carbon dioxide, the corresponding original volume of pure air in the mixture before the reaction took place must have been 80 + 12 = 92 vol.

Now, there being 20.9 per cent. of oxygen and 79.1 per cent. of nitrogen in pure air, the quantity of oxygen in the original air was 92 × 0.209 = 19.23 vol., nearly. The volume of free oxygen remaining in 100 parts of the mixture after the reaction has taken place is, then, 19.23 — 12 = 7.23 vol. and that of nitrogen, 80 — 7.23 = 72.77 vol.

Since these volumes are computed for 100 vol. of the mixture, the several volumes represent the respective percentage of each gas in the mixture. The composition of the *residual* mixture is, then, as follows: oxygen, 7.23 per cent.; nitrogen, 72.77 per cent.; methane, 8 per cent.; carbon dioxide, 12 per cent.

* * *

Assuming, on the other hand, that the No. 4 mixture referred to here was formed by adding carbon dioxide to the mixed air and methane, the composition of the *artificial* atmosphere thus formed is calculated in a similar manner; but, in this case, it is evident that there are 80 vol. of original air in 100 vol. of the mixture. The corresponding volume of oxygen, therefore, is 80 × 0.209 = 16.72 vol., and that of nitrogen 80 — 16.72 = 63.28 vol.

The composition of this artificial atmosphere is, therefore, as stated on p. 998, as follows: oxygen, 16.72 per cent.; nitrogen, 63.28 per cent.; methane, 8 per cent.; carbon dioxide, 12 per cent.

* * *

It will be of interest, in this connection, to calculate the composition of a firedamp mixture rendered nonexplosive by the addition of carbon dioxide. This calculation is based on the assumption that firedamp is rendered nonexplosive by the addition of a volume of carbon dioxide equal to one-seventh of the volume of the firedamp *at its most explosive point,* or when the firedamp mixture contains 9.46 per cent. of methane mixed with otherwise pure air.

In this case, 100 vol. of the firedamp will contain 9.46 vol. of methane and 90.54 vol. of pure air. To render this volume of firedamp nonexplosive, it is assumed that there will be required 100 ÷ 7 = 14.28 vol. of carbon dioxide added, which will make the total volume of the mixture 100 + 14.28 = 114.28 vol. The percentage of pure air in the mixture, after the addition of the carbon dioxide, is 90.54 ÷ 114.28 = 79.22 per cent. In like manner, the percentage of methane in the mixture is 9.46 ÷ 114.28 = 8.28 per cent., and that of carbon dioxide is 14.28 ÷ 114.28 = 12.50 per cent.

One hundred volumes of this mixture, which has been rendered nonexplosive by the addition of carbon dioxide, therefore, contains pure air, 79.22 vol.; methane, 8.28 vol.; carbon dioxide, 12.50 vol. The volume of oxygen in the air of the mixture is, then 79.22 × 0.209 = 16.55 vol. and that of nitrogen 79.22 — 16.55 = 62.67 vol. As before, these volumes represent percentages.

Finally, the composition of the nonexplosive firedamp mixture is as follows: oxygen, 16.55 per cent.; nitrogen, 62.67 per cent.; methane, 8.28 per cent.; carbon dioxide, 12.50 per cent.

⁂

Effect of Head on Motor in Pumping

Kindly answer the following question in Coal Age: If a centrifugal pump, driven by a motor having a speed of 860 r.p.m., is operated under a head of 150 ft., what will be the effect on the motor operated at the same speed if the head against which the pump is discharging is reduced from 150 ft. to 75 ft.? Please notice that the motor is operated at the same speed, against the different pressure heads.

Richard Todhunter.

Barnesboro, Penn.

This question was submitted to the engineering department of one of the oldest and largest manufacturers of centrifugal pumps and elicited the following answer:

Replying to the question, What will be the effect on the motor driving a centrifugal pump, in case the head against which the pump is discharging is reduced, assuming the motor is operated at the same speed in each case, we would advise that this usually results in a much larger quantity of water passing through the pump, and, unless the pump has been carefully designed, the motive power is considerably overloaded.

The Cameron pump is so designed that, in the event of the discharge head being reduced, resulting in an increase in the gallons of water pumped, this increment is nevertheless not sufficient to seriously overload the motor.

J. J. O.

New York City.

Examination Questions

Alberta, Canada, Examination for First-Class Certificates, Held June 23-25, 1914

EXPLOSIONS, UNDERGROUND FIRES AND INUNDATIONS

Ques.—In a dry and dusty mine where inflammable gas is given off in the workings, what precautions would you take to prevent the ignition of coal dust? If no inflammable gas was found, would you continue to take these precautions? Give reasons.

Ans.—It is important to make and enforce rigid regulations in regard to shooting the coal and loading out all dust and fine coal from the working faces. Every precaution should also be taken to prevent the scattering of coal along the roads, by the use of dust-tight cars and enforcing strict regulations in regard to the "topping" of the cars in loading. All haulage roads should be cleaned regularly, on the night shift. If the roadways and travelingways are particularly dry, a suitable sprinkling system should be installed throughout the mine.

All holes should be carefully inspected, charged and fired by authorized and competent men, after the workmen have withdrawn from the mine. Only permissible powder should be used, and the shotfirers should be authorized to condemn and refuse to fire any shots that, in their opinion, are doubtful or dangerous. The coal should be suitably undermined, and care should be taken to place all shots in such a position that the charge will be free to perform its work. All holes should be tamped with sand, fireclay or other incombustible material.

An ample system of ventilation should be employed and the air current made to sweep each working face in such a manner as to keep it free from gas. Each place should be tested with a safety lamp before firing a shot therein. The firing of shots should begin on the "last of the air" and proceed in order toward the intake, in each section of the mine. Sufficient time should be given, after the firing of each shot, for the air current to regain its normal condition at the face of the room next adjoining. This will require a somewhat longer time to fire the shots, but is the only safe method to pursue.

Most of the precautions just named should be followed in the operation of a dry and dusty mine, whether inflammable gas is present or the workings are practically free from gas; for the reason that, under these conditions, even a small percentage of gas that would escape attention may cause a dust explosion; or such an explosion may occur in the absence of any gas.

Ques.—An explosion has occurred in a mine where inflammable gas is frequently found in the workings. The fan is undamaged and still working. An examination of the return air indicates that a fire exists in the workings. What precautions for their own safety are necessary to be taken by an exploring party entering the mine?

Ans.—It is difficult to answer this question without being familiar with the plan of the mine and the circulation of the air currents. It may be assumed, however, that the mine is ventilated in separate sections or districts, each having its own air split. It is probable that the fire exists in that section of the mine where the explosion occurred. However, it is also possible that the force of the explosion has destroyed the overcast or division doors that would permit the circulation of the return currents, laden with gas from other sections, to pass over the fire and give rise to a second explosion.

An exploring party, entering a mine after an explosion, under the conditions named, always incurs some risk of being exposed to a second explosion. To reduce this risk to a minimum, the exploring party should enter the intake of the mine and follow the air current to the first section. If this is in good condition and the explorers have fair assurance that the fire is still further inby, they should proceed promptly along the main intake to the second section, and, in the same manner, to the third section, until one is found showing evidence of fire within, or where the circulation is so deranged that the return of that section is passing into the mine instead of into the main return airway. In either case, it would be well to cut off the air from entering that section and, if possible, erect a temporary brattice in the main intake, inby of the mouth of the section, so as to isolate, for the time, the remaining sections of the mine.

In the meantime, preparations should be made to bring water to the fire, which must be fought from the intake side, taking every precaution to prevent gas from reaching the fire, and maintaining only sufficient air for the performance of the work. Safety lamps only should be used throughout the mine when making the exploration.

Ques.—To what causes do you attribute spontaneous heating underground? How can this heating be detected, and what steps would you take to eliminate the danger?

Ans.—Excessive heating of underground workings is generally due to the existence of a slow combustion going on in the gob or in some abandoned workings. This may be due to spontaneous combustion having taken place in the fine coal stored in the waste, or to the accidental ignition of a feeder of gas in the floor underneath the waste and which has ignited the coal. A similar heating and, in some cases, ignition may result from the steady advance of a heavy squeeze, in deep workings, especially where the coal is highly inflammable and more or less gas exists.

To prevent such a spontaneous heating of the mine workings, every precaution should be used to keep fine coal and dust out of the waste stored in the mine. All waste and abandoned places should be carefully sealed or thoroughly ventilated by a sufficient "scale of air." To prevent the occurrence of a squeeze, in deep workings, a sufficient ratio of pillar to opening should be maintained throughout the mine.

The heating of mine workings can be detected by the increased temperature of the workings or by the heating of the coal in the ribs; or if fire exists this is often made known by the peculiar odor that an experienced miner readily detects.

Coal and Coke News

Harrisburg, Penn.

There will be no more all-night sessions in the saloons of towns in the anthracite region, nor will employees of the coal companies be able to secure their "morning eye-opener" while on their way to work should success meet the efforts of several of the burgesses, who are sending letters to all saloonkeepers requesting them to sign a gentlemen's agreement to close their bars at 11 o'clock at night and keep them closed until 7:30 in the morning.

The movement, which was inaugurated 10 months ago, by the burgess of Edwardsville, has the indorsement of the Kingston Coal Co. and the Delaware, Lackawanna & Western Coal Co., and it is thought that other big companies will join the movement, seeing therein the long-awaited opportunity to break up the practice of their employees of stopping in saloons before starting the day's work with the result that they are negligent of the maxims and rules and work injury upon themselves and their fellow employees. There are indications that the hotel men of Edwardsville and Kingston will sign the proposed agreement and thus make the movement a success. Should such action be taken the result will be watched with interest by officials of coal companies throughout the state.

Without doubt the proposed movement of the burgesses and the coal companies would work for the betterment of all concerned, the employees of the coal companies, their families and dependents, the municipalities in which they reside and the hotel keepers themselves.

It is not the intention of the coal companies to enter into the prohibition or local option movement in any way, nor to forbid its employees from drinking. They feel, however, that it is contrary to the laws of safety to allow an employee to enter the mines in the morning after he has spent most of the night in a saloon, with probably a "hang over" or has spent some time in a saloon in the morning on his way to work and had an opportunity to become intoxicated.

The companies intend notifying their employees that discharge will be the punishment for breaking the rule of drinking before going to work.

It is thought that more good can be accomplished, however, by securing the consent of the saloonkeepers to close their bars at an early hour and keep closed until the men have started their day's work and with this end in view the companies have coöperated with the burgesses in the proposed movement.

The Proposed Canal

With ninety per cent. of the surveys finished and 75 miles of the total length of the 104.5 miles laid out and mapped, the Lake Erie and Ohio River ship canal, the half-century-old dream of coal and steel men for an all water route from Pittsburgh to the Great Lakes, is brought down to concrete preparation in the first report of the canal board laid before Governor John K. Tener, on Jan. 13.

Within the next four or five months, the report announces the board will have completed its preliminary work and be ready to submit estimates of the cost of the giant engineering feat.

A tentative route with an alternate is submitted, definitely indicating the probable course which the canal, beginning at Pittsburgh, will take in reaching Ashtabula, Ohio, on Lake Erie.

Beginning at the junction of the Beaver and Ohio rivers, passing up the Beaver River to the junction of the Mahoning and Shenango rivers; thence up the Mahoning River to a point two miles beyond Warren, Ohio; thence northerly across the divide into the Grand River valley; along this valley to a point 8 miles from Lake Erie; thence northerly down the Lake slope coming out on Lake Erie near the mouth of Indian Creek; 6 miles west of Ashtabula, a total distance of 104.5 miles.

The alternate route contemplates building the canal across the divide from the Mahoning River at Niles, Ohio, thence up Mosquito Creek and into the Grand River valley to a junction with the previous route.

Four great reservoirs are proposed. One of these, the greatest of the four and one which will be an engineering task of immense proportions, will be constructed in the Pymatuning swamp on the Shenango River above Turnersville, Penn., with a capacity of 16,500,000,000 cu.ft. of water, which it will receive from its own watershed as well as that diverted from French Creek. The Mahoning River reservoir will have a capacity of 1,500,000,000 cu.ft., and that on the north branch of French Creek, 2,200,000,000 cu.ft. capacity. A reservoir on Pymatuning Creek, which will not be available for canal purposes but only for regulating the Shenango River, will have a capacity of 3,500,000,000 cu.ft. of water.

Six billion cubic feet of water, artificially stored, will be required annually to regulate the flow of Shenango River.

The principal sources of supply from which water may be obtained will be the Shenango and Mahoning rivers, French and Pymatuning creeks. A conservative estimate places the amount available annually from these sources at 20,000,000,000 cu.ft. of water.

PENNSYLVANIA

Anthracite

Carbondale—Two men were killed by a premature blast in the Erie Coal Co.'s mine at Mayfield on Jan. 14. It is said that the miners were using dynamite and both bodies were torn and mutilated, making recognition almost impossible.

Scranton—Every mine and colliery of the Delaware, Lackawanna & Western Coal Co. in the valley was ordered to suspend operation Jan. 15 and 16. Over 18,000 men were affected. Weather conditions were assigned as being solely responsible for this shut down.

Highland—Fire of unknown origin, which started in the tipple and spread so rapidly that for a time it was thought it would communicate to the underground workings, destroyed the coal breaker of the G. B. Markle Co., on the night of Jan. 15. Howard Howells, chief clerk and paymaster of the coal company, lost his life when he was buried under falling timber while serving coffee to the firemen. Officials of the company could not assign the cause for the disastrous blaze, but announced that work on the reconstruction of the giant breaker would begin at once. While the debris was still smoldering in sections, and firemen guarding against a renewal of the fire, squads of men were put to work clearing away the wreckage, to prepare the way for the builders. In the meantime, most of the 600 men and boys who were employed in the breaker are left idle.

North Scranton—In an opinion handed down on Jan. 14, by Judge E. C. Newcomb, the Scranton Board loses its case to enjoin the Clearview Coal Co. from mining under No. 40 school. The injunction was asked by two city taxpayers, backed by the school board and the state. The school district requested the court not only to order mining under the school property to cease until such time as proper support was provided, but that mining within a distance of 375 ft. of the school premises should be stopped. The case probably will be carried to the Supreme Court.

Kingston—A modern hospital equipped with the latest appliances for giving medical attention to injured workmen, has been completed at the No. 4 colliery of the Kingston Coal Co. Officials of the company are the first to install such an emergency hospital on the west side of the river and plan to erect a similar one at the Gaylord colliery at Plymouth.

Bituminous

Connellsville—The coke trade continues to improve and shipments have increased about 15,000 tons and production 7000 tons per week. No idle ovens have been fired but the running time is better. It is understood that one or two contracts are under negotiation, but details are carefully guarded, and there is no precise information available. Buying of prompt furnace coke has increased.

Pittsburgh—Improvement in the fuel situation is visible, there being a somewhat better call from manufacturing interests. It is said that Lake buyers are in the market for approximately a million tons of coal. This is an encouraging symptom, as inquiries from the Lakes do not usually appear until Apr. 1. Railroads are also bidding for their 1915 requirements, which are somewhat larger than were taken in 1914.

More than 700,000 bushels of coal were taken south Jan. 14, by the steamers "W. K. Fields" and "James Moren." This shipment comprised practically all of the coal stored in the local harbor. It was made to Louisville, from where the coal will be conveyed to lower Mississippi points by larger towboats.

The school of mines of the University of Pittsburgh has opened its university extension classes in the mining towns of western Pennsylvania for the third year. Five classes have been organized to study the subjects of mine gases, ventilation, law and safety in preparation for the fireboss examination. These are located at Uniontown, Mount Pleasant, Leisenring, Yukon and Russellton. In addition, a class in more advanced subjects to prepare candidates for the mine foremen's examinations is being conducted at Irwin. The enrollment in the six towns is 157, exceeding that of the two previous years. Among the number are 5 superintendents, 4 mine foremen, 8 assistant foremen, 14 firebosses, 3 hoisting engineers, 2 electricians and 4 mining engineers. The remainder are chiefly miners, motormen, machine runners, pumpers, timbermen, etc. The ages of the students range from 16 to 51. Each class will meet once a week in the evening with a member of the school of mines faculty.

Kittanning—It was learned on Jan. 15, that negotiations for the sale of a block of 21,000 acres of Freeport vein coal lands in Armstrong and Clarion counties, for about $5,000,000, are under way and that the deal will probably be consummated in a short time. The coal is owned by a group of capitalists, most of them residing in Kittanning. The block of coal lands under consideration lies along the Allegheny River, and, it is said, may be mined by drift workings opening directly to the river bank. The coal is said to be among the best steam-making coals in the country.

Ebensburg—The store and offices of the Cardiff Coal Co. were recently destroyed by fire, with a loss of about $15,000. Manager Charles Williams sustained painful burns in rescuing books and papers of the company. The post office was also damaged. The blaze started in the oil room of the store, but the cause is unknown.

WEST VIRGINIA

Charleston—It is indicated by District President Thomas Cairns, of the miners' union, that the organization will vigorously oppose the proposal to establish a state constabulary in West Virginia, similar to that in Pennsylvania. A bill for this purpose has been drafted for introduction in the legislature at this session.

The proposed tax upon coal production, at the rate of ½c. a ton, is meeting with considerable opposition on the part of coal operators. Its advocates point to the expenses of the mining department of the state, miners' hospitals and so forth as a reason for the tax, together with the fact that the state has lost a considerable revenue by the exclusion of the liquor industry. It is estimated that the tax would produce about $300,000 a year.

The South Penn Oil Co. recently leased 5600 acres of oil lands in the Cabin Creek district, from the Ohley Coal Co., the lessor receiving a liberal bonus for the oil rights. The United Fuel Co. is also negotiating a lease for about 3000 acres. These deals are regarded as forerunners of an era of great prosperity.

Huntington—Plans are now being formulated, looking to the transfer of the equipment of three of the Ohio mines owned by the Lorain Coal & Dock Co., to the tract of land east of Logan recently taken over by that concern. Already considerable work is being done on this firm's new tract, and engineers are surveying for railroad spurs which are to run from the Chesapeake & Ohio R.R. about a mile away. The Lorain Coal & Dock Co. will not move its offices from Columbus to Huntington as was rumored some time ago.

Hinton—The congestion of coal cars at Newport News continues, and there appears to be no immediate prospect of relief. The east-bound coal movement over the Hinton division has slightly improved, but no permanent amelioration is looked for until shipping conditions are better at the seaport. The export trade is light and but few vessels are putting in at the terminal for coal.

Bluefield—The production of coal along the Norfolk & Western is declining. In November, 1,852,858 tons were handled. During December, shipments totaled 1,641,165 tons. This is believed, however, to be the low mark, and it is thought that the January shipments will show an increase

Kingwood—Within a few weeks, the Irona mine near here will be operated to capacity and turning out more coal than ever before in the history of the plant. The company houses will all be repaired and put in shape for occupancy, and the store will be put in commission as soon as the demand warrants.

Matewan—The Allburn Coal & Coke Co. recently purchased from the Thacker Mining Co. the lease of the Lynn Coal Co., comprising several hundred acres of coal land about a mile east of this town. The amount involved in the deal is estimated at $60,000. It is said that the new owners will develop the property within a short time.

KENTUCKY

Sebree—The Walnut Coal & Coke Co., Frank P. Helm and S. P. Miller, promoters, has begun sinking a new shaft near the old Sebree mine. The coal bed will be reached at a shallow depth and it is understood the company will work it. Machinery to begin operations on a small scale is to be installed, though the operation will be increased later, and the company is expected to be ready to hoist coal in the near future.

Hazard—After an expenditure of a quarter of a million dollars, the Ashless Coal Co. has opened a mine at Lothair, which will have a daily output of 4000 tons. The operation consists of two main entries, located on opposite mountain sides, separated by a narrow valley, which is spanned by the tipple, reached at either end by the mine tracks from the entries. For several months the company has been building bridges, railroad tracks, power house, tipple, machine shops and miners' houses and everything else to be found in a modern mining camp, including a telephone system. Mining operations began with a force of 40 miners and the output is running about 350 tons daily, but will be extended until the maximum is reached. The company plans in the near future to drive another entry further up the valley, opening up the No. 5 vein.

OHIO

Brilliant—J. C. Ault, one of the receivers under the United States Court, for the Dexter coal mine, recently stated that the mine had been operated by order of the court under the anti-screen law, for a year, and although $100,000 worth of business had been done, only expenses had been made. Nothing was made for the creditors and the assets of the company had been depleted in an attempt to prove that the mine could be operated profitably under the new law. The receivers have not been able to pay off any bonds and even taxes have gone delinquent. They have called a meeting of creditors, stockholders and bondholders, for Jan. 23, to take action for closing the mine down and selling it.

Portsmouth—It is announced that the holdings of the Buckhorn Coal Co., in Lawrence County, have been leased to Pirrung, Evans & Co., of Ironton, Ohio, and that the lessee will at once begin operating the two mines. The capacity of the workings is about 150 tons a day.

Hamden—Milton Mine No. 3, one of the best known properties in Jackson County, has been sold by the Dayton Coal & Iron Co., of Dayton, Ohio, to Eli Oury, of Wellston, who will start operations in the near future.

Joyce—The West Goshen Mine, the largest in York township, which has been closed since Apr. 1 last, has been opened, giving employment to 50 miners. The mine was formerly occupied by the now defunct Goshen Coal Co. and was sold to William MacKay, of Cleveland. The New Philadelphia Coal Co. has leased the property.

Starr—The Coonville mine at Starr, has been closed permanently, throwing 200 miners out of work.

INDIANA

Evansville—The Evansville Central Labor Union has added its protest to the chorus going up against the practice of coal stripping in southern Indiana. The protest was in the form of a resolution asking the legislature to stop the evil practice.

The Newburg Coal Co.'s property at Newburg, Ind., has been sold by William O'Brien and James P. Abshire, to Louis Julian and R. G. Humphrey. The new owners will continue to operate the mines.

Bicknell—The new Oliphant-Wasson mine at Bruceville is nearing completion. The fifth vein has been reached, which has a thickness of 5 ft., 10 in.

ILLINOIS

East St. Louis—One of the largest damage suits recently filed against a mining company is that of Theo. Minkanich vs. New Staunton Coal Co., for $15,000.

Willisville—Arrangements are being made here to dismantle the mine of the Missouri & Illinois Coal Co., and to abandon the property. This mine has a capacity of 600 tons a day, and has been working continuously for several years, producing coal for the M. & O. R.R. It is one of the few mines in the southern Illinois field that operated night and day.

Belleville—The recent meeting held here by the operators of the 5th and 9th Districts, including operators who belonged to the association of independent operators, and also representatives of the coöperative mines, failed to bring about a solution of the local problem. In a general way, it is understood that the purpose of the meeting was to get an understanding from the coöperative miners as to whether they would insist upon getting for their labor the same scale of wages that the miners were paid in mines belonging to members of the association. Failure on the part of the coöperative miners to do this, brings about a condition of competition that is absolutely ruinous to the operators who are paying their miners the union scale. It was brought out at the meeting that some mines have not worked for a period of over three years.

Danville—More than 500 miners, idle since last November, have been put to work in the Danville mining district. Among the mines reopened are those belonging to the Bunsen company, which supplies coal to the steel mills at South Chicago and Joliet.

Gillespie—The three mines of the Superior Coal Co. made an average of 12,222 tons per day worked during 1914. This is the largest ever made by the three mines. During the month of December, with 22 working days, mine No. 1 hoisted 90,143 tons; No. 2, 96,406; and No. 3 mine hoisted 82,334 tons. The greatest record for mine No. 1 was reached during this month, when a hoist of 3919 tons was made in one day.

Harrisburg—The Saline County Coal Co. mine No. 3 broke the county record for hoisting coal on Jan. 14. In 8 hr., 81 railroad cars were loaded, or a total of 3388 tons were produced. This mine is said to be the most modernly equipped of any in southern Illinois.

ARKANSAS

Greenwood—James Slankard and Ree Trout, charged with the murder of two guards in the rioting at the Bache-Denman coal mine No. 4, in the Prairie Creek district last July, were acquitted Jan. 15. After introducing evidence to prove an alibi, the attorney for the defense placed three physicians on the witness stand who testified that the bones found in the burned miner's cabin supposed to have been those of the two guards were not human remains.

COLORADO

Cokedale—Cokedale, which is one of the most important coke manufacturing centers in Colorado, situated about 20 miles west of Trinidad, faces extinction as the result of a recent recovery by the Federal Government of 4000 acres of coal land alleged to have been fraudulently acquired by the Carbon Coal & Coke Co., and which has been deeded back, following a series of suits brought in the Federal courts of Denver. The town stands for the most part on this land, and the question of what shall be done with it is puzzling the authorities.

PERSONALS

George L. Morgan, one of the Illinois state mine inspectors, with headquarters at Benton, has been transferred to Peoria. He will be succeeded at Benton, by J. E. Jones, who has been stationed at Danville.

Ezra L. Foulks, the "Grand Old Man" of the Hopkinsville, Ky., business interests, and the Nestor of all the coal men in the southwestern part of the state, has just passed his 92d birthday. He was not in sufficiently good health to receive his friends on his birthday.

J. H. Winder, recently made general manager of the Sunday Creek Co., has been elected president of the Hocking Valley Coal Operators' Association to fill the vacancy caused by the resignation of E. A. Cole. When Mr. Cole resigned as president of the Sunday Creek Co. he also resigned as head of the operators' association.

M. T. Fahey, who has been acting as superintendent for the past year for the Manor Coal Co.'s works, and who recently resigned, was recently presented with a gold watch, chain and locket, the latter bearing the inscription "Presented to M. T. Fahey by the employees and members of the Manor Big Vein Coal Co., Shaw, W. Va."

Mrs. Ella Bird, of Francisco, Ind., has been appointed as a mine inspector by the Gibson County Mine Commissioners. This was a reappointment, Mrs. Bird having served, with the two men who complete the inspection board, since its founding. Following the death of her husband, who owned the Francisco mine, Mrs. Bird continued to operate it. She is thoroughly versed in mining practices.

OBITUARY

David G. Jones, aged 54, general manager of the Pittsburgh-Buffalo Coal Co., and a well-known coal operator, died late on Jan. 16, following an operation. Besides his connection with the Pittsburgh-Buffalo Co., Mr. Jones was president of the Four States Coal Co. of West Virginia, and the Dexter Coal Co. of Ohio.

CONSTRUCTION NEWS

Lisbon, Ohio—The Lewis and Evans mine, north of Lisbon, which has been in operation for five years, is to be enlarged into a railroad mine. Trestles and tipple will be built at once.

Viper, Ky.—The Viper Coal Co. is starting the initial work on a coal development about one mile north of here, on the Lexington & Eastern R.R. It will build sidings, coal tipples, miners' residences, commissary, power station, etc., giving employment to several hundred men.

Whitesburg, Ky.—As a preliminary step toward building into the eastern Kentucky coal field the Baltimore & Ohio R.R. has just filed a mortgage at Whitesburg, Ky., to secure $5,000,000 of bonds. The active competitor of the B. & O. in this field will be the Louisville & Nashville R.R.

Andersonville, Penn.—The new tipple of the Anderson Coal Co. on the Montour R.R., near the old McPherson mill in Cecil Township, is completed and a coal town is fast springing up. This village promises to be a scene of activity next summer when the large, modernly equipped mine will be put in operation. The foundation for a large store which the coal company is building has been completed. This structure will stand close to the site of the old McPherson mill which was burned down some months ago.

Wilkes-Barre, Penn.—Sprinkler systems that can be turned on by hand from outside of the building are being installed in 14 of the wooden anthracite breakers of the Lehigh Valley Coal Co., while two more similar installations are in contemplation. The new sprinkler systems consist of pipes 10 to 15 ft. apart with nozzles pointing upward at equal intervals which dash the water against concave plates of metal causing an umbrella-shaped spray to fall to the floor. The nozzles are so placed that these water sprays will cover the entire breaker area, and 800 to 3000 gal. of water per minute can be discharged or a quantity equal to that flowing from one to four fire hoses. The new systems supplement but do not replace any of the regular fire fighting apparatus.

NEW INCORPORATIONS

Ashland, Ky.—The Alum Creek Block Coal Co. has been incorporated with $250,000 capital and J. W. M. Stewart, president, K. M. Fitzgerald, secretary-treasurer. The concern is understood to have arranged for an indefinite acreage though it is not in the market for mining machinery just at this time.

Wilmington, Del.—The Elliott-Chapman Coal & Coke Co., a Delaware corporation, has gone into voluntary bankruptcy in the United States Court here, with liabilities of $38,000 and assets of $20,000. Melville B. Chapman, of New York, and Charles W. Bush, of Wilmington, have been appointed receivers.

Sutton, W. Va.—The Otter-Birch Coal & Coke Co. has been incorporated with a capital stock of $250,000. The concern will have its chief works in the Otter and Birch districts of Braxton County. The incorporators are O. P. Markle, Isadore Frank, W. W. Markle, W. C. Hawk, and A. D. Williams, all of Uniontown, Penn.

Charleston, W. Va.—At a meeting of the Main Island Creek Coal Co., recently held here, it was decided to increase the capital stock from $500,000 to $1,000,000, for the purpose of providing funds for extensive improvements to the company's properties. About $200,000 will be spent at Island Creek on new operations, two steel tipples, a new store building to replace that which was recently burnt, and a number of miners' houses. It is the intention of the company to double its production of 50,000 tons this year.

INDUSTRIAL NEWS

Hazard, Ky.—It is reported that Williams & Wilson have leased a tract of 1000 acres on Buffalo Creek which they will develop.

Connellsville, Penn.—The Union Line recently placed the first order for equipment since the rate decision. This calls for 500 steel tank cars.

Buffalo, N. Y.—The discount of 1 per cent. on Canadian paper here has disturbed the Canadian coal trade materially, as for the buyer to pay it appears to advance the price of coal and for the shipper to stand it seems a reduction of the price.

Columbus, Ohio—The Ohio Utilities Commission has granted a rehearing to the Lake Shore & Michigan Southern Ry. Co. in the case involving joint rates with the Lorain & Southern, an industrial road. The commission recently held that the Lorain & Southern is a common carrier and thus is entitled to a share in the freight revenues with the Lake Shore.

Chicago, Ill.—A bill was recently filed in the United States District Court, asking the foreclosure of the first mortgage bonds of the Chicago & Indiana Coal Ry. Co., a property absorbed by the Chicago & Eastern Illinois R.R. This suit was filed in behalf of the Metropolitan Trust Co., of New York, trustee of $5,000,000 bonds of the coal road, dated Dec. 1, 1885. It is the second foreclosure suit in six months.

Bristol, Tenn.—In order to prevent confusion in trade names, the Enterprise Foundry and Machine Works now terms its product, Enterprise wheels, instead of A. J. Whitney's wheels. There has been no change in the personnel of this firm. Mr. Whitney will continue as heretofore to give his direct personal supervision to the manufacture of self oiling and roller bearing wheels for the mine car trade.

Huntington, W. Va.—It is stated that the Chesapeake & Ohio R.R. is well equipped to care for an increase in the volume of the coal traffic which is expected to result from the transfer of the activities on the part of certain Ohio mine operators to West Virginia and Kentucky. Four thousand coal cars have been recently purchased by the road; 2000 of these are of 70 tons capacity and 1000 are of 57½ tons.

Harrisburg, Penn.—Figures compiled at the state Department of Mines show that there were 401 fatal accidents in the bituminous fields of the state, last year, as against 611 in 1913. There were 596 such accidents in the anthracite field, as against 624 in the previous year. The production of anthracite coal last year was about the same as that in 1913, but bituminous was 34,000,000 tons less than in the preceding year.

Whitesburg, Ky.—It is reported here from the plants of the Consolidation Coal Co., the Elk Horn Mining Corporation in the Jenkins-McRoberts-Fleming-Haymond-Hemphill field, that mining continues to increase rapidly and that by Feb. 1 all the mines, it is safe to say, will be running full time. New men are being added every week, and preparations going forward getting in readiness for a complete resumption at all of the mines.

Chicago, Ill.—It was stated recently before the Federal Arbitration Board hearing the wage demands of western railroad engine men, that for every $1000 paid railroad firemen in 1913, on a number of western railroads, 100 fewer tons of coal were shoveled into locomotive fireboxes than in 1890. The assertion that firemen's productive efficiency showed a decrease from 1890, was made after and examination of the records of a selected number of coal burning roads.

Pittsburgh, Penn.—Optimism pervades the minds of coal operators in the Pittsburgh district. They feel that an uprising status of the manufacturing and transportation industries is imminent, and that the demand for fuel will approximate and perhaps exceed the volume of tonnage put out in 1913. It is stated that buyers of fuel for the larger consuming concerns of the country are making inquiries for prices for the coming year, and that the tonnage asked for bespeaks prosperity.

New York City, N. Y.—"Safety Engineering," known as The Magazine of Safety, is to be published hereafter by the Safety Press, Inc., 80 Madison Lane, New York City. This magazine is now in its 14th year, having been founded in April, 1901, under the name of "Insurance Engineering," by Franklin Webster, president of the Insurance Press. For several years it was devoted largely to fire prevention and fire-proof construction, and its attention to that important field is to be continued as heretofore.

Washington, D. C.—Two sailing vessels were chartered by the Government, Jan. 15, to go to Philadelphia to transport coal from the Richmond Street pier. This was done by the Navy Department in order to overcome the situation in the upper Delaware River which forbids the use of 19,000-ton colliers because the northern part of the channel is not deep enough to accommodate them. The department is determined, if possible, to take as much of the Pennsylvania coal as it can. The big colliers will therefore be sent to Hampton Roads and the small ones to Philadelphia.

Pittsburgh, Penn.—Many rumors have been circulated concerning the coal deal between J. V. Thompson, of Uniontown, and interests supposed to represent the United States Steel Corporation. It is stated, however, upon good authority that Mr. Thompson has practically closed the deal with H. C. Frick and a number of his business associates for about 60,000 acres of coal land in the Dunkard Creek Valley of Greene County, the price being about $300 an acre, or a total of $18,000,000. The report that the United States Steel Corporation is the purchaser is without foundation.

Philadelphia, Penn.—The joint petition and appeal by the Pennsylvania, Philadelphia & Reading, Central R.R. of N. J., Lehigh Valley, and the Delaware, Lackawanna & Western R.R. companies, respondents from the filing of the order of the Public Service Commission of Pennsylvania in the Philadelphia anthracite case, contains the petition and appeal of these respondents with 31 assignments of error and a number of exhibits of the numerous complaints with respective answers of the respondents and the report of the Public Service Commission. The assignments of error are in some cases similar to those filed for the companies in their separate petitions and appeals.

Elkins, W. Va.—The Davis Colliery Co. and the Junior Mercantile Co. recently moved into their new office and store building at Bower, W. Va. This structure replaces the one destroyed by fire Mar. 16, 1914, and is of absolutely fireproof construction; the walls being of brick, floors, roof and stairways of concrete, and the partitions of gypsum blocks. The basement and first floor are occupied by the Junior Mercantile Co., and the upper floor by the colliery company as offices, drafting rooms, etc. The arrangement and conveniences embody the latest features in buildings of this kind, and it is thought that this is the finest building for the purpose in the state. The total cost of construction was about $30,000.

Washington, D. C.—Arguments were begun here, Jan. 15, before the Interstate Commerce Commission marking the conclusion of the investigation into the rates, practices, rules and regulations governing transportation of anthracite. Eleven of the principal coal carrying roads are involved, and the case is considered one of the most important before the Commission. One of the side issues is the interest of the hard coal carrying roads in the anthracite they transport. The investigation was begun in 1912, and the testimony fills about 70 volumes. The Government position was stated to rest on the contention that the cost of transportaion, the investment of the roads and the disposition of their income did not justify the rate charged.

Uniontown, Penn.—The First National Bank of Uniontown, of which J. V. Thompson is president, failed on Jan. 18. This bank has a capital of $100,000, deposits of approximately $2,600,000 and has been paying 22 per cent. annual dividends. In Pittsburgh coke circles, no surprise whatever was felt over the failure of this bank, the only surprise being that the trouble had not developed sooner. It is entirely a reflection of the overbonding of certain coke operations whereby the interest, sinking fund and exhaustion fund cannot possibly be provided from selling prices of coke as the coke market has been in recent years. Some of the coke interests have long been unable to take care of their bonds which have been held largely by banks. It is thought that this failure may precipitate other developments.

St. Louis, Mo.—A suit recently filed in the Circuit Court here is creating considerable attention in coal mining circles. It is that of the Missouri & Illinois Coal Co. vs. Willis Coal & Mining Co.; contract, $60,527.26. This suit, it is understood, is the result of an order from the defendant to the plaintiff, notifying the plaintiff to cease the mining and shipping of coal on the order of the defendant. The coal was sold by the defendant to the M. & O. R.R., as company fuel. The mine of the plaintiff, it is understood, is located on the royalty right of the defendant, said right being leased to the plaintiff on a royalty basis. The plaintiff, then in turn, mined and produced the coal and sold it again to the defendant. The mining property in question is at Willisville, in Randolph County, Illinois. The general business depression is given as the cause of the curtailment of coal to be used for fuel purposes by the M. & O.

Coal Trade Reviews

General Review

A general sweeping reduction in the working schedules of the hard-coalers. Bituminous trade also less encouraging. Situation on new contracts indeterminate. Sharp break in the Middle Western boom.

The extremely mild weather has brought the expected relapse in the anthracite market, and the collieries are all under heavily restricted working schedules—a most unusual condition at this season of the year. Prices have so far been fairly well maintained, but the outlook is not encouraging over the balance of the season. It is a weather market entirely from now on, and with only two coal-burning months left, consumers will restrict their orders to the minimum.

The situation on bituminous has become equally depressed. The gradual improvement noted over the past several weeks, fell flat this week, and the movement was confined almost entirely to old orders. Some increase in the demand offshore has toned up the market slightly, but ocean freights are so erratic and uncertain that little business can be negotiated in this direction. The higher grades are possibly somewhat steadier, but the general situation cannot be regarded as other than most disappointing.

Increased interest is noted in contracts as the season advances. So far there has been no definite developments, and the situation is decidedly mixed. Operators are reluctant to start negotiations at a time when the market is so demoralized, while consumers on the other hand feel that there are strong possibilities of obtaining concessions on last year figures. The situation will probably not be straightened out for several weeks, and in the meantime both consumers and producers are following the trend of conditions keenly.

While the Pittsburgh market is apparently holding its own, the gradual improvement of the past several weeks has ceased, for the time being, at least. Mines working on railroad business seem to be the best fixed. Prices are generally irregular, and there are no immediate indications of any improvement. The Ohio market has also slowed up, due apparently to the mild weather, but there is still a fair amount of business being done as compared with that of several weeks ago. The industrial depression continues the predominating factor in the situation; manufactures are only buying for their immediate requirements which, in most cases, are substantially below normal.

Southern consumers appear to be satisfied that they have sufficient stocks to carry them through the balance of the winter, and buying is at a minimum. Operators are at the moment chiefly concerned with the opening of summer business.

Even the Middlewestern market, where the outlook has been particularly encouraging, has suffered a sharp reversal. The long stretch of mild weather has caused the demand to practically disappear at some points, and the trade is entirely lacking in the vigor that marked the closing days of December. There was apparently considerable stocking against a possible curtailment over the holiday period, and a reaction has set in which has been further aggravated by the summer-like weather. The decline is apparent in all parts of the Middle West, and a general slump is to be expected unless there is a return of the cold weather.

ATLANTIC SEABOARD

BOSTON

Rather more interest in season contracts; $2.85 f.o.b. Hampton Roads understood to be the basis. Spot market still very slow, but high ocean freights a factor in the outlook. George's Creek prices the same as last year. Water freights stiffen. Anthracite demand sluggish again.

Bituminous—A moderate inquiry for season prices has developed during the week but so far there has been nothing really significant. It is understood that $2.85 f.o.b. Hampton Roads will be the price aimed at by the various interests but it is altogether too early to make forecasts. A mild January is not favorable to firm prices. The current demand is meanwhile as slow as has lately been the rule. Except as interruptions to shipping have temporarily cut down receipts there is only a light inquiry at the distributing points for inland supplies. On car prices continue more uniform.

Dumpings on a larger scale for shipment off-shore has given a better tone to the market on Pocahontas and New River and the agencies are encouraged to hope for better things a month or two hence. Such prospects, however, have little effect on current prices; $2.70 is still about the average figure, all grades considered, and shippers are actively seeking orders. There is a shortage of bottoms, another obstacle to the interests wanting to place coal.

Seven collieries ordinarily faring between Chesapeake Bay and Boston have been chartered off-shore and there is hardly enough sail and barge tonnage to replace them, or would not be if business were normal. Each of the larger steamers carries about 30,000 tons per month and it takes a number of schooners to freight that amount of coal in the same period. This condition and the thick stormy weather have seriously interfered with the prompt release of cars at the Virginia terminals.

A few more weeks will clear up the situation so that some line can be had on the new season's trade. The curtailment in mining will probably be adhered to for a time at least; then conditions will dictate some sort of policy and the usual scramble for busines will begin.

The Georges Creek shippers have announced that season prices will be the same as last year. They are still in arrears on current orders, but a fortnight of clear weather will straighten them out.

Pennsylvania interests are following the market very closely in the hope of finding conditions more favorable for their output. There is almost no spot business on the Pennsylvania grades and bargains can be had at all the shipping piers.

Water Freights have stiffened materially the past ten days. Not only has the weather shortened up the supply of tonnage, but an increasing number of colliers are being chartered off-shore. Even schooners of 3500 tons capacity have been chartered to take cotton to points like Genoa on terms that seem very remunerative to the carrier; $5000 per month and $8@9 a ton have been mentioned as going rates. It is not surprising that large vessels, Hampton Roads to Boston can now command 85c. as a minimum.

Anthracite—The mild weather has put the hard-coal trade back into almost a midsummer demand. Several of the collieries have closed down for a week at a time because of the coal accumulated at the loading piers.

Wholesale prices on bituminous are about as follows:

	Clearfields	Cambrias Somersets	Georges Creek	Pocahontas New River
Mines*	$0.90@1.50	$1.15@1.65	$1.67@1.77	
Philadelphia*	2.15@2.75	2.40@2.90	2.92@3.02	
New York*	2.45@3.05	2.70@3.20	3.22@3.32	
Baltimore*			2.85@2.95	
Hampton Roads*				$2.60@2.75
Boston†				3.68@3.78
Providence†				3.63@3.73

* F.o.b. †On cars.

NEW YORK

Bituminous situation more discouraging. Interest centers on new contracts. Exceptionally mild weather causes a general slump in anthracite and operations are heavily curtailed.

Bituminous—It is difficult to see anything of an encouraging nature in the local bituminous situation. The past few weeks have witnessed a progressive, though very slow, broadening of the market, but this has apparently come to a complete standstill the current week. Probably this was more or less directly due to the almost summerlike weather, but whatever the cause it is evident that there was a complete cessation in new orders.

Bunkering contracts, most of which expire on the first of the year, have been mostly renewed on the same basis as last year. On other contracts, which are now beginning to come up, there is little heard as yet. Both operators and consumers appear mutually reluctant to close; the former because of the difficulty in negotiating a satisfactory deal when the market is so weak, and the latter because of the exceedingly low prices which have ruled continually over the past year. It is still felt in all quarters that last year's figures will be generally obtained on the new contracts, the exceptions being those on which operators succeeded in forcing prices unwarrantably high last year.

The New York market is quotable on the same basis as follows: West Virginia steam, $2.35@2.55; fair grades, Pennsylvania, $2.55@2.65; good grades of Pennsylvania, $2.70@2.80; best Miller Pennsylvania, $3.10@3.15; Georges Creek, $3.15@3.25.

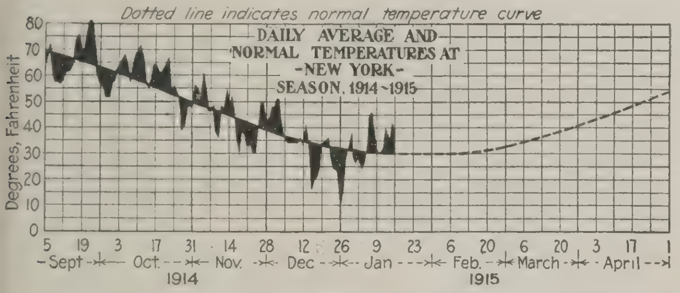
Anthracite—A somewhat protracted period of springlike weather has created havoc with the anthracite trade as evidenced by the strict curtailment generally observed in all directions. The Reading and Susquehanna companies cut their operations 50% last week, and the Lehigh Valley made a similar reduction the current week. The market is exceedingly flat and it is commonly said that the independents are producing sufficient coal to meet all the current demand.

On the domestic sizes, egg coal is in the best demand, though the call for chestnut is fairly good; a few individuals, however, are offering chestnut at the same price as stove coal in order to avoid demurrage charges.

There is a large supply of pea coal in all directions, but prices are holding relatively firm, the maximum concession being only about 10c. per ton. There is a slight shortage of high grade buckwheat No. 1 but a continuance of the mild weather will soon relieve this. Rice is the hardest of all sizes to move, particularly the lower grade qualities. Good grade barleys are doing well, but the off qualities are weak.

A continuance of the exceedingly mild temperatures will soon be reflected throughout the anthracite industry from the smallest dealer to the largest producer. Such heavy overstocks are accumulating in all directions that some drastic move will have to be undertaken. The New York hard-coal market is now quotable on the following basis:

	Upper Ports		Lower Ports	
	Circular	Individual	Circular	Individual
Broken	$5.10	$4.60@5.10	$5.05	$4.55@5.05
Egg	5.35	5.10@5.35	5.30	4.80@5.30
Stove	5.35	5.20@5.35	5 30	5.15@5.30
Chestnut	5.60	5.45@5.60	5.55	5 30@5.55
Pea	3.55	3 45@3.55	3.50	3.35@3.50
Buckwheat	2.80	2.70@2.80	2.50@2.75	2.35@2.75
Rice	2.30	2.25@2.30	2.00@2.25	1.80@2.25
Barley	1.80	1.70@1.80	1.75	1.35@1.75



BUFFALO

Bituminous improving very slowly and shippers are becoming impatient. Mines still running about half time. Anthracite quiet; sales appear to be slacking off because of early activity.

Bituminous—The improvement anticipated some weeks ago has failed to appear as yet; in fact a good many shippers are of the opinion that the demand is not as good as it was, due mostly to the mild weather. There is some resumption of business, but it is by no means general and will have to be much larger to make up for falling off last autumn. Buffalo shippers who are in touch with Pittsburgh find that there is doubt as to the propriety of making a Buffalo base price in the spring, as has been done in former years by one of the leading companies there. The future of the trade is more uncertain and the price will have to be made lower, which is anything but desirable.

The bituminous mines in the Allegheny Valley are running about half time and though the supply of slack is very light this is due to the fact that the sale for three-quarter is not large. Shippers say that in spite of the stiffer price for slack they are obliged to be careful about handling it. The railroads are buying a little more actively, but they have not yet shown much disposition to stock up though mines with good rail orders appear to be better off than the average. There is no material change of prices in the bituminous trade. Quotations are still on the basis of $2.80 for Pittsburgh lump, $2.70 for three-quarter, $2.55 for mine-run and $2.15 for slack. Allegheny Valley prices rule 25c. lower than Pittsburgh.

Anthracite—The quiet condition of the trade continues though shippers do not feel like complaining. The report that there is likely to be a shortage at Upper-Lake ports before spring is not seriously considered here. If coal runs short there the Eastern shipper will be greatly surprised, though it is fairly certain that much less will be left over than last spring.

One company is loading coal into Lake vessels, having about 100,000 tons afloat at present. More tonnage is in demand, but it is difficult to get. Sales of grain for export have been more active lately, so that tonnage should be plentiful soon.

The city anthracite trade is fairly good. Some competition is developing on the part of the sellers of independent anthracite, the circular price being cut slightly now. The scarcity now centers on egg, which was lately very plentiful.

TORONTO, CAN.

Weather mild and the market very quiet.

Trade is steady, but quiet for the season which since the New Year has been generally mild. Dealers are generally carrying large stocks and only light shipments are coming forward. Prices remain unchanged as follows: Retail, anthracite egg, stove and nut, $8; grate, $7.75; pea, $6.75. Bituminous, steam, $5.25; screenings, $4.35; domestic lump, $6; cannel, $7.50. Wholesale f.o.b. cars, three-quarter lump, $3.78, screenings, $2.79.

PHILADELPHIA

Anthracite continues listless. Operations still on reduced basis. Bituminous shows improvement in spots, but the general condition remains about the same.

Anthracite—Outside of the call for buckwheat, which is fairly strong, there is no short size in the market. Just at the present time, the call for buckwheat is in excess of the output, under the restricted mining, and it is understood that active reloading of this size is taking place at the storage yards of the large companies. Chestnut is probably the next size showing the most active call. The restricted output of stove and egg is being absorbed, but the most strenuous efforts are necessary to place it. Outside of the gas companies, the market is requiring very little broken coal, and at many operations this size is being reduced.

The Tidewater market still manifests weakness, the New England trade being well supplied with coal. Low temperatures may create a demand, which will enable the operators to work full time, but the outlook is not encouraging now. Prices are well maintained, despite the dull market, although it is understood that concessions on all sizes are being made by the individuals, in order to find a prompt disposal of their product.

Prices at Tidewater rule about as follows:

	Circular	Individuals
Broken	$4.75	$4.50
Egg	5.00	4.80@4.90
Stove	5.00	5.00
Chestnut	5.25	4.90@5.00

Bituminous—While the general situation shows little or no improvement, better conditions are commencing to appear in certain coals. This is especially true of the Georges Creek; in fact, the demand on the line is interfering with their Tidewater obligations, and considerable delay is experienced in gathering a cargo together. Other coals reflect this improved condition, but not to an appreciable extent. Good fuels are quoted at $1.35 at the mines, with the medium grades 25 to 30c. less.

BALTIMORE

Warm weather depressing the trade. Prices weaker, especially on slack. Railroad movement improves.

The coal trade is being affected adversely by the warmer weather. The temperatures throughout the East and Middle West have been considerably above normal. A drop in the demand Westward is noted and attributed largely to this cause. In the local territory the hard-coal trade has also suffered largely from the higher temperatures. Smaller sizes, which have been a feature of the recent activity, were much weaker.

In bituminous the price list was not as strong, although there was no great amount of spot business done. Slack sold in several cases around 60c., which was about ten to fifteen cents off some sales a week or ten days ago. In the Fairmont district three-quarter sold at 85c., and run-of-mine at about 75c. West Virginia steam coals sold at from 80 to 85 cents.

The Pennsylvania situation was somewhat better. Somerset best grades brought $1.25 in limited quantities, with from poor to medium 95c. to $1.10. The Clearfield situation was about the same.

The various coal agencies here are busier figuring on the approaching contract period than on immediate business. A number of cars of sample coal are now being shipped. The consumers are rather slow in coming in for contracts, and the trade is showing no tendency to sacrifice, as all feel that better industrial times are coming that will boom the coal business and set a much higher standard of prices.

HAMPTON ROADS

Accumulation of coal somewhat reduced. Prices unchanged. Indications point to a heavy January tonnage.

Dumpings at Hampton Roads for the week have been about fair. In addition to coastwise and foreign shipments, the government has also been taking some coal, mostly barges for loading into vessels of the fleet now in Hampton Roads. The coastwise movement has been mostly to Boston with other large cargoes to Providence, Portland, Lynn and Savannah. Export cargoes have gone to Havana, Iquique, Para, and Barbadoes. Small cargoes are still moving to the foreign trade in schooners. Taking the month's movement thus far there is a decided improvement shown over the December dumpings and the outlook for a large tonnage is fair.

Prices on the various grades remain unchanged. The demand has not been heavy, and so far as can be ascertained practically all of the coal moving has been contract business.

Steamer clearances for the week ending Jan. 10, were as follows:

Vessel	Destination	Vessel	Destination
Isle of Jura[1]	Havana	Denis[1]	Para, Brazil
Chincha[2]	Iquique, Chile	Korsfjord[2]	Barbadoes
*Sallie C. Marvil[2]	Hamilton, Bermuda		

[1] Loaded at Newport News. [2] Loaded at Norfolk. *Schooner.

OCEAN CHARTERS

Coal charters have been reported by the "Journal of Commerce" as follows:

Vessel	Nationality	From	To	Tons	Rate
(Grace boat)	American	Atlantic Range	San Francisco San Diego†	4000*	$6.50
Allanwilde		Baltimore	Martinique	565	
Bertha L. Downes		Baltimore	Martinique	606	
Dustin G. Cressy		Baltimore	Mayport	726	
Ruth E. Merrill		Baltimore	Boston**	2309	

Note—Steamers are indicated by **bold face** type, all others being schooners.
* To 5000 tons d.w. † or Puget Sound, $7. ** or Portland.

OCEAN FREIGHTS

Conflicting rates on charters U. S. to the Plate with Cardiff demanding substantially higher figures than are obtainable locally. Freights generally continue at prohibitive levels.

During the past week a British steamer locally controlled of about 6000 tons capacity, early February loading, was offered firm at $7.20 to the Plate and a neutral steamer about 5000 tons capacity, late January loading, was asking for an offer of $7.20 for the same voyage. But the coal interests claim that American coals cannot be sold in the Plate in competition with Cardiff, on a basis of $7.20 freight. Numerous cables were received from the other side, stating that $8.40 and later $9 was offered from United States to the Plate, and last Saturday the British steamer "Induna," about 6000 tons capacity, was closed in London, from Baltimore to the Plate at $9.30.

On American orders shippers can arrange charters on much better terms here than in London. Various owners are now asking the same rate that the "Induna" secured.

Freights to other destinations are unchanged and the market is quotable as follows:

To	Rate	To	Rate
Havana	$**2.00**	Guantanamo	$2.50@2.75
Cardenas or Sagua	**2.50**	Demerara	**4.50**
Cienfuegos	**2.50**	Bermuda	2.40@2.50
Port of Spain, Trinidad	2.75@3.00	Vera Cruz	**2.50**
St. Lucia	2.50@3.00	Tampico	**2.50**
St. Thomas	**2.50**	Rio*	**9.60**
Barbados	2.75@3.00	Montevideo, Buenos Aires or La Plata	8.40@9.30
Kingston*	**2.50**	Mediterranean	**9.60**
Curacao	2.25@2.50	Valparaiso	4.80@6.00
Santiago	2.50@2.75		

*Small boats to Kingston $2.50@2.75.
W. W. Battie & Co.'s Coal Trade Freight Report.
Note—Rates noted in **bold face** type are only approximate.

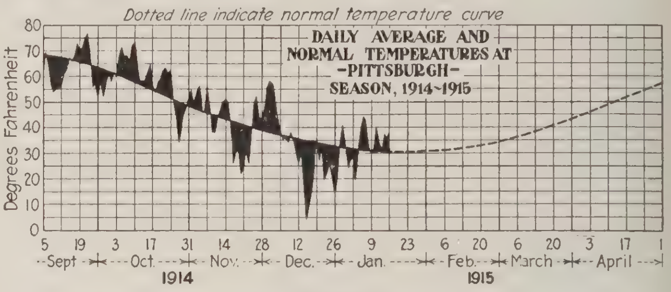
OHIO VALLEY

PITTSBURGH

Market shows no further improvement, but is holding its own, with mines operating at slightly over 50% of capacity. Prices unchanged.

The market has experienced no further improvement, but is about holding the gain recently made. The weather has been exceptionally mild and retail demand has not developed further, while the industrial improvement that seemed to be in full swing two or three weeks ago has not gained any additional ground. The steel mills are consuming from one-fourth to one-third more coal than in December but do not seem to expect any further increase within a week or two, the steel market having been relatively quiet in the past fortnight.

Prices continue to be rather irregular, but are better maintained than a month ago, and the whole feeling in the trade continues to be one of much higher hopes than were entertained until very recently. The general market, subject to some cutting, stands about as follows: Slack, 90c.@$1; nut and slack, $1.05; nut, $1.10; mine-run, $1.15; ¾-in., $1.25; 1¼-in., $1.35, per ton at mine, Pittsburgh district. Mining operations in the district as a whole are averaging somewhat over 50% of capacity.



TOLEDO

Steam trade better but the market continues a weather proposition.

The extremely soft weather of the past week has been bad for the trade generally. While there has been no change in prices for mine shipments, those caught with coal on track have been compelled to sell at a sacrifice. Some cold weather, however, would make the market active. There has been some improvement in the steam trade during the past week, owing to the fact that many of the factories which were closed down for inventories during the holidays have resumed operations.

COLUMBUS

Warmer weather has caused a slight lull in domestic demand. Steam business still slow. The small sizes in good demand.

A slight weakness in domestic trade is noted, due to warmer weather. The market is purely and simply a weather proposition from this time on and the tone is still satisfactory as yet.

Dealers are not increasing their stocks, believing that shipments can be obtained promptly when the trade is brisker. Stocks are larger than at the first of the year, when inventories were completed. Trade is coming in fairly steady, but orders generally are small. Retail business is still on a good basis with prices ruling firm at the levels which have prevailed for some time. Pocahontas and West Virginia coals are in good demand but there is also a good movement of Hocking and Pomeroy varieties.

Production has shown a slight decrease because of the lull in domestic trade. Hocking Valley is reported as producing 65% of the usual tonnage and Jackson, Cambridge, Crooksville and Massillon are outputting about the same amount. In the Pomeroy Bend field the production is estimated at 85% of the average.

Steam business is still slow and there are no immediate indications of an improvement. Railroads are taking a little more fuel for train movement but other lines are not increasing their requisitions. Manufacturing is still at a low ebb and collections are bad all along the line. The small sizes are selling well, with nut, pea and slack quoted around 65 and 70c. and coarse slack about 10c. less.

There is a good steady demand for anthracite with prices ruling firm. Retail figures are: Chestnut, $8.25; egg, $8 and grate, $7.75.

Prices in the Ohio fields are:

	Hocking Valley	Pomeroy	Kanawha
Rescreened lump	$1.50	$1.60	.....
Inch and a quarter	1.45	1.50	$1.45
Three-quarter inch	1.35	1.40	1.35
Nut	1.15	1.25	1.15
Mine-run	1.10	1.15	1.10
Nut, pea and slack	0.70	0.75	0.65
Coarse slack	0.60	0.65	0.55

CLEVELAND

Consignment coal is plentiful. Brokers are refusing to receive some that is offered. Prices range lower on a dull market.

Fairmount and Richland No. 8 are so freely offered that the coarse-coal market is very low. Fairmount 1½ in. is being sold at $1.75 and West Virginia No. 8 three-quarter at the same price. These coals are on consignment and are difficult to move because of the small demand.

Fine coal on track here is selling at $1.60 to $1.70; Ohio fuels are bringing the lower figure and high-grade Fairmount is moving at the higher price. Brokers could have more coal on consignment, but there is some on demurrage that was brought in on consignment and they are afraid to touch it.

Although 200 tons a day are being mined in Ohio No. 8 mines, it is not reaching the open market. Railroads are taking the bulk of it and contracts would cover a good deal more than is being produced. The retail trade is dull because of the warm weather. Prices for shipment are higher than in the spot market and this is keeping Pennsylvania coals out. The prices for shipment are off about 5c. a ton as compared with a few weeks ago. There were 600 cars of coal on track the first of the week.

Shipment quotations are as follows:

	Pocahontas	Youghiogheny	Bergholz	Fairmount	W. Va. No. 8
Lump	$3.60	......	......	......	......
Lump, 6 in.	......	......	$2.35	......	......
Lump, 1½ in.	......	......	2.20	$1.95	......
Lump, 1¼ in.	......	$2.35	......	......	......
Lump, ¾ in.	......	2.25	2.10	1.90	$2.05
Egg	3.60	......	......	......	......
Egg, 6 in.	......	......	2.00	......	......
Mine run	2.60	2.15	1.90	1.85	1.95
Slack	......	1.80	1.75	1.70	1.75

CINCINNATI

A fair tonnage is moving but there is little activity on new business. Mild weather and industrial inactivity are adversely affecting the market.

The business of the past week was considered satisfactory, though it was decidedly below expectations. Deliveries on contracts were fairly good, there being a better call for the steam grades than for some time. This was largely due to a better feeling in the iron trade, and to increased activity in coke. However, it remains true that the industrial depression continues, as far as the large manufacturers are concerned. They are only buying for current consumption, which is much below normal.

Mild weather has hurt the domestic market, and retailers are buying only as their stocks become exhausted. For the most part this enables them to keep up with the demands of their customers, and only a real cold snap, with a rush of domestic orders will stimulate the domestic business.

COKE

CONNELLSVILLE

First National Bank of Uniontown, the coke bank, closed, and J. V. Thompson properties go into a receivership. Coke market quiet with quotations unchanged. Production and shipments slightly larger.

A great event in the coke trade, by no means unexpected, has occurred. At the beginning of the week the First National Bank of Uniontown was closed by the banking authorities and this was followed by the appointing of a receivership for the J. V. Thompson coal properties. For years it has been known that various coke interests were unable to meet their full fixed charges, involving banks that were carrying their bonds, while Josiah V. Thompson, who controlled the First National Bank of Uniontown has been a heavy buyer and a relatively light seller of coking coal acreage, particularly in Greene County, comprising the extension across the Monongahela River of the regular Connellsville coking coal seam. In coke circles the impression is that the closing of the one bank in Uniontown is merely the beginning of a general adjustment, which had really been expected before this. While the depression in the iron industry may be given in some quarters as the cause of the present financial involvment, a long range view indicates that the real difficulty is that the Uniontown interests did not allow, in their plans for the future, for the great development in byproduct coking that has been taking place, and which enables the steel industry to use other coal, rather than pay relatively high prices for the best, or what may possibly be the only suitable coal if the old beehive practice is followed.

The coke market has been very quiet, with occasional sales of prompt coke but no contracting. Prices remain quotable as follows: Prompt furnace, $1.60; contract furnace, $1.75; prompt foundry, $2@2.20; contract foundry, $2.15@2.25, per net ton at ovens.

The "Courier" reports production in the Connellsville and lower Connellsville region in the week ended Jan. 9 at 206,602 tons, an increase of 4105 tons, and shipments at 216,888 tons, an increase of 15,176 tons.

Buffalo—The demand for coke is about what it was and all efforts of the shippers to make the trade do anything better have not succeeded. They undertook to advance their prices, but the consumer failed to respond, so that there was nothing to do but to continue selling at the old price, which was on the basis of $4.25 for best 72-hr. Connellsville foundry, with $3.30 for stock coke. Consumers of coke are very particular, so that coal dealers do not like to handle it. For some reason the Buffalo gas light company has put the price of its gas coke up from $5.40 to $6.

Columbus—Coke is in fair demand at prices unchanged from December quotations.

Chicago—Domestic sizes are firm but the demand is lessened. Quite a number of shipments of coke have been on hand this week drawing demurrage. Prices for furnace and foundry coke have declined about 10c. per ton, and are as follows: Byproduct, $4.60@4.75; Connellsville, $4.60@4.80; Wise County 72-hr. (select), $4.60@4.75; gas coke, $4.10@4.25.

THE STEEL INDUSTRY

Operations increased slightly. London market strong with a tendency to advance. Local buying still restricted.

Pittsburgh advices give a more favorable aspect to the steel trade. Mill operations in the district are now stated to be at 50 to 55% of capacity, which shows a considerable gain in the rate of production as compared with the preceding week.

Most interesting news has just been cabled to us by our London correspondent. He states that the British iron market is excited, with pig-iron prices rapidly rising. The makers of pig iron, especially producers of hematite or bessemer iron, are now being obliged to pay $3.65 per ton for freight on ore from Spanish ports to Middlesbrough. Other branches of the iron trade are finding their costs advancing because of scarcity of labor, and are raising prices.

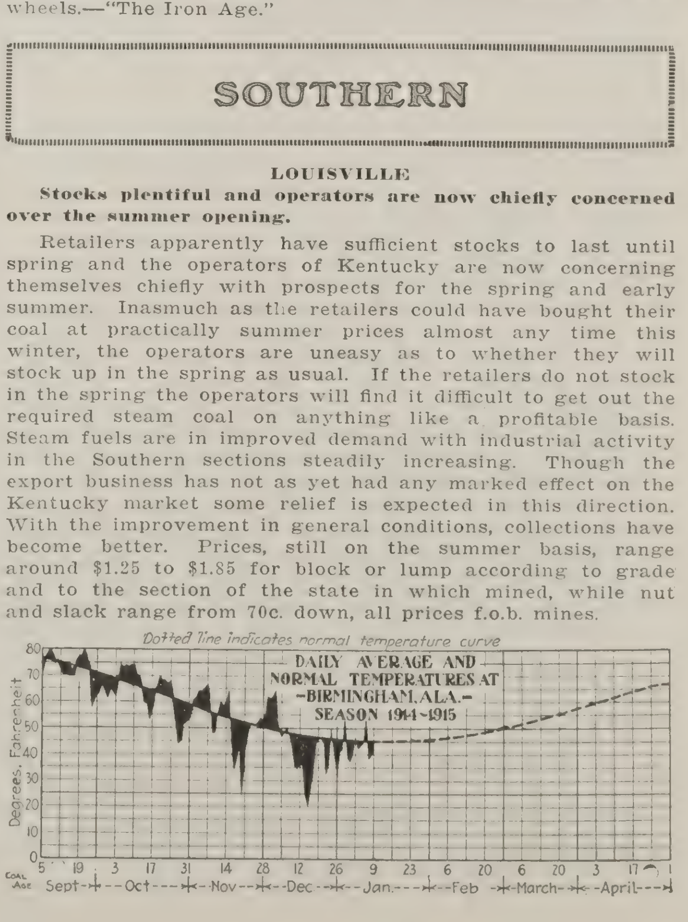
Our home markets show no great increase in buying. The railroads are quite freely placing orders for such track material as spikes, bolts and angle bars, but are not ordering large quantities of rails. Conspicuous among pending business for track material is that of the New York Central, which is inquiring for 30,000 kegs of spikes and bolts. It is reported that the Southern Pacific has bought 30,000 tons of rails; the Norfolk & Western Railroad has bought 5000 tons from the Carnegie Steel Co. and the United States Steel Products Co. has booked orders from South America for 13,000 tons. The Baltimore & Ohio is inquiring for 25,000 tons and the Hocking Valley 4000 tons. The New Haven's contract for 18,000 tons of rails has been practically awarded, 16,000 tons being divided between the Pennsylvania and Bethlehem Steel companies, the remainder going to the Lackawanna Steel Co. In connection with railroad business it is interesting to note that the Pullman Co. has an inquiry out for 15,000 passenger carwheels.—"The Iron Age."

SOUTHERN

LOUISVILLE

Stocks plentiful and operators are now chiefly concerned over the summer opening.

Retailers apparently have sufficient stocks to last until spring and the operators of Kentucky are now concerning themselves chiefly with prospects for the spring and early summer. Inasmuch as the retailers could have bought their coal at practically summer prices almost any time this winter, the operators are uneasy as to whether they will stock up in the spring as usual. If the retailers do not stock in the spring the operators will find it difficult to get out the required steam coal on anything like a profitable basis. Steam fuels are in improved demand with industrial activity in the Southern sections steadily increasing. Though the export business has not as yet had any marked effect on the Kentucky market some relief is expected in this direction. With the improvement in general conditions, collections have become better. Prices, still on the summer basis, range around $1.25 to $1.85 for block or lump according to grade and to the section of the state in which mined, while nut and slack range from 70c. down, all prices f.o.b. mines.



MIDDLE WESTERN

CHICAGO

Milder weather weakens situation and market is spotty. Screenings not so strong. Anthracite trade good.

A week of milder weather has curtailed the demand, and the general situation is not so satisfactory. Small-lot buying now predominates and the vigor of the closing days of December is lacking. There has been reduced running time at the Illinois and Indiana mines with less production, and observers note a decreased tonnage as compared with previous seasons. The heavy accumulation of screenings prior to the holidays in anticipation of a shutdown at the mines had a bullish tendency, and the market is now feeling the reaction with the result that screenings are softening somewhat, although there is no extreme weakening tendency. Conditions seem to be less unsettled for Indiana coals than for the Illinois product.

The anthracite trade is in a healthy condition; the demand for chestnut is brisk, while egg and stove are being absorbed about as fast as received. There is an influx of considerable low-price anthracite from independent operators into the Western territory. Some of the docks are also making special prices but there is no decided tendency in this direction.

Franklin, Williamson and Saline County coals have been greatly influenced by the weather, and very few of the operators have been able to secure the recently established $2 price for domestic lump.

The production of Indiana coals has been reduced, but the demand has fallen off even faster though prices are relatively firm. There has been a loss of 5c. to 10c. per ton in the price of screenings.

Less domestic coal has been demanded from the Springfield District, and screenings are not so strong. The adverse weather has affected the situation here particularly.

Eastern Kentucky coal seems to have a broader market. Circular prices for lump in several cases have been reduced 15c. per ton, but there is little of this spot coal in Chicago.

A few Hocking shipments have been sacrificed the past week to prevent accrual of demurrage, but prices are reasonably firm.

Prevailing quotations are as follows:

	Franklin Co.	Springfield	Sullivan	Clinton	Carterville

ST. LOUIS

Continued warm weather causes a sharp break in the market. Prices have receded all along the line and the situation is notably weaker with operations again heavily restricted.

The past week has been a most distressing one to the local coal trade. Summer weather has prevailed now for ten days or two weeks, and the demand has practically disappeared even on the steam grades. Everything seemed to go down together; screenings which should be in good demand are almost a drug on the market in some quarters. There has been some little demand for the country trade, but this has been well taken care of, and the mines have already curtailed their output in many instances.

In the Williamson-Franklin County field the operators have made a heroic but futile effort to keep market prices up. The washed market for No. 1 size is in fair condition, but the other grades are dragging, with the exception of No. 4. In the Standard district, 2-in. lump is selling for as low as 85c., while screenings are going at anywhere from 45 to 50c. If warm weather continues, screenings will decline in price, as there is absolutely no demand at all for domestic coal. The situation is relieved some by two or three large railroad orders, which were placed the latter part of December for shipment during January. These orders are being filled to the maximum.

There is practically no anthracite moving in, very little if any smokeless, and the local coke situation is anything but encouraging.

The prevailing circular is:

	Williamson and Franklin Co.	Big Muddy	Mt. Olive	Standard	Sparta

INDIANAPOLIS

Milder weather and demand lighter, especially for domestic lump. Screenings also affected and prices shaded 10c. a ton. Industrial situation puzzling. Mine operations slowing up.

With milder weather, the consumption of domestic coal fell off, making operations less active at the mines. The price of slack, the strength of which has been a feature for several weeks, also decreased about 10c. a ton.

The industrial situation is puzzling; there are indications that it is improving, yet the improvement is so slow and gradual that it scarcely is reflected in a larger demand for coal. Until the return of milder weather there was a good business at fair prices, though not quite up to the average for the season. Some of the retail dealers here claim they have not had a better trade in a similar period in recent years.

KANSAS CITY

The coal market is slightly stronger; retailers are taking on some stock, but prices are unchanged.

The market conditions in Kansas City have shown but little change. The weather continues mild, but the stocks of the retailers are beginning to run low. The possibility of an increase in prices during the winter is dwindling and nothing short of a famine will bring this about. There are practically no large contracts being let. The continued low price of oil, and the uncertainty of that fuel market, keeps the buyers in a very uncertain frame of mind.

PRODUCTION AND TRANSPORTATION STATISTICS

IMPORTS AND EXPORTS

The following is a comparative statement of imports and exports of the United States for November, 1913-14, and for the eleven months ending November, 1912-13-14, in long tons:

	11 Months			November	
Imports from:	1912	1913	1914	1913	1914
United Kingdom	6,294	5,329	16,429	70	7,757

VIRGINIAN RAILWAY CO.

Shipments over this road for November, 1914, amounted to 281,499 tons, as compared with 341,703 the preceding month.

Coal Contracts Pending

Contracts listed in this department are authoritative in every respect except where the source of information is questionable, in which event it is noted. All contracts are listed promptly on receipt and only repeated when additional information becomes available or in the last issue previous to the day on which bids will be closed. Liberal remuneration will be paid for all legitimate notices of this kind sent in.

Contract No. 37—New York—The section of this contract (p. 1048, Vol. 6, and p. 149, Vol. 7) which called for furnishing and delivering 75 tons of coal in the Borough of Bronx, for which like bids were offered by the Consolidation Coal Co. and Olin J. Stephens, will not be awarded to either bidder. The action has been deferred so that the department may purchase this supply in the open market. Address Robert Adamson, Fire Commissioner, Fire Department, 11th Floor, Municipal Building, New York.

Contract No. 43—New York—The bids on this contract (p. 108), which provides for furnishing 48 tons of stove coal, 390 tons of egg coal, 765 tons broken coal, 300 tons buckwheat coal, 15 tons of Cumberland coal, 14 tons of nut coal, for the Department of Parks, were as follows: Burns Bros., $8797.97; Meyer-Denker & Sinram, $8904.50. Address Department of Parks, Municipal Building, New York.

Contract No. 52—Buffalo, N. Y.—The Board of County Commissioners of Erie County, N. Y., will receive sealed bids for the supply of coal required at the Court House for the two years commencing Feb. 5, 1915. Bids will be opened at 1 p.m., Feb. 2, 1915, and the Board reserves the privilege to reject any or all bids. Address J. D. Stevenson, County Clerk, Buffalo, N. Y.

Contract No. 53—Siloam Springs, Ark.—The Municipal Electric Light & Water Plant will soon be in the market for 1500 tons of coal. The business is usually let on competitive bids. Both mine-run and slack are required, the customary prices ranging about $2.70 for the former, and $2.25 for the latter. Address M. Halooson, Recorder, Municipal Electric Light & Water Plant, Siloam Springs, Ark.

Contract No. 54—Two Rivers, Wis.—The Municipal Water & Light Plant at this place will soon be in the market for about 1600 tons of coal. Youghiogheny coal is commonly used, and the usual contracting figure is around $3.55 per ton. Address Geo. H. Wehausen, Supt., Municipal Water & Light Plant, Two Rivers, Wis.

Contract No. 55—Springfield, Ill. — The Springfield Water Department is in the market for 10,000 tons of 1¼-in. mesh coal deliveries to begin on Mar. 1, and be at the rate of 150 tons per day. Address W. J. Spaulding, Commissioner Public Property, Springfield, Ill.

Contract No. 56—Milwaukee, Wis.—Sealed bids were received until Jan. 18, for furnishing and delivering 2000 tons of coal to the Menomonee special sewage pumping station. Delivery is to be made at the pumping works in quantities of not less than 200 tons per month until Oct. 31, 1915. Bond for $1800 or check for $900 to accompany all bids. Address Fred G. Simmons, Commissioner of Public Works, or Percy Braman, deputy, Milwaukee, Wis.

Contract No. 57—Warrensville, Ohio—Sealed proposals will be received by the city of Cleveland, Ohio, until noon, Jan. 27, for furnishing coal for the Correction Farm at Warrensville. Specifications and further information may be obtained at the office of the Secretary to the Director of Public Welfare, Room 209 City Hall, Cleveland, Ohio. A. R. Callow, Room 511, City Hall, Cleveland, is Commissioner of Purchases and Supplies.

Contract No. 58—Cleveland, Ohio—Sealed proposals will be received by the city of Cleveland, Ohio, until noon, Jan. 27, for furnishing coal for the outdoor relief. Specifications and further information may be obtained at the office of the Secretary to the Director of Public Welfare, Room 209 City Hall, Cleveland. A. R. Callow, Room 511, City Hall, is Commissioner of Purchases and Supplies.

Contract No. 59—Warrensville, Ohio—Sealed proposals will be received by the city of Cleveland, until noon, Jan. 27, for furnishing coal for the Cooley Farm, Warrensville. Specifications and further information may be obtained at the office of the Secretary to the Director of Public Welfare, Room 209, City Hall, Cleveland. A. R. Callow, Room 511, City Hall, Cleveland, is Commissioner of Purchases and Supplies.

Contract No. 60— Detroit, Mich.—The Department of Public Works received bids up to 10 a.m., Jan. 21, for furnishing its coal requirements until Jan. 31, 1916. Deliveries are to be made in railroad cars, wagon lots at the yards, sidings or barns, as directed. The bidders were required to file a certified check for $800 with their bid, same to be forfeited in the event of their failure to enter into contract with a surety company bond, for the full estimated amount of the contract within five days after the award. Address George H. Fenkell, Commissioner, Department of Public Works, Detroit, Mich.

Contract No. 61—Erie, Penn.—Bids were received by the city council at this place, on Jan. 21, for furnishing the requirements at the garbage plant during the fiscal year, ended Dec. 31, 1915. Only the best Pittsburgh ¾-in. lump coal was considered and prices quoted were to be delivered f.o.b. Garbage Disposal Plant, Belle Valley, Penn., in self-clearing hoppers. Address Frank E. Pelow, superintendent, Department of Parks and Public Property.

Contract No. 62—New York—Bids will be received by the President of the Borough of Queens, Long Island City, until 11 a.m., Jan. 29, for furnishing and delivering the following: (1) 650 gross tons bituminous coal to the Far Rockaway disposal plant, 5th ward, Borough of Queens, deliveries to be made during the year 1915, and the security required will be 30% of the amount for which the contract is awarded. (2) 280 gross tons pea coal to the Newtown disposal plant, 2nd ward, Borough of Queens, with deliveries and security requirements the same as above. (3) 1040 gross tons anthracite coal to the County and Borough Buildings in the Borough of Queens with requirements the same as above. (4) 280 gross tons bituminous coal to the Crematories of the Bureau of Street Cleaning at Far Rockaway and Aqueduct, Borough of Queens, with deliveries and security requirements the same as above. These contracts will be awarded at a lump or aggregate sum. Blank forms and further information may be obtained at the office of Maurice E. Connolly, President, Borough Hall, Jackson and 5th St., Long Island City, New York.

Contract No. 63 — Lorain, Ohio — The following is list of the bidders on this contract which provides for furnishing 3500 tons of coal for the water works department: John Stack, Lorain, Ohio; The Midvale-Goshen Coal Co., Cleveland, Ohio; The Tuscora Sand & Coal Co.; The Kendall Coal Mining Co.; Ohio & Michigan Coal Co.; Lagron Coal Co., Lorain, Ohio; Peoples Coal & Supply Co., Lorain, Ohio; The West Virginia & Ohio Coal & Coke Co.; Consumers Coal & Supply Co., Lorain, Ohio; Goshen Valley Mines; Smith Coal & Supply Co., Lorain, Ohio; Keystone Coal & Coke Co.; Black Diamond Coal Co. Address, L. B. Johnston, Clerk, Board of Public Service, Lorain, Ohio.

CONTRACTS LET

Contract No. 21—Cleveland, Ohio—County Commissioners of Cuyahoga County awarded the Easterbook Coal Co. this contract (see pp. 892, 933, 972, Vol. 6). The contract provides for furnishing 2000 tons of No. 8 nut or mine-run at $2.40 delivered, 100 tons of Massillon lump at $4.25, and 50 tons of anthracite egg at $7.10. The company also bid $2.48 for Pittsburgh nut or mine-run. Address E. G. Krause, Clerk of the Board of County commissioners, Cuyahoga County, Cleveland, Ohio.

Contract No. 26—St. Louis, Mo.—The awards on this contract (pp. 972, 1009, Vol. 6), which provides for furnishing 30,000 tons of coal for delivery at various engineering departments of the United States Army, have been made as follows:

BALD EAGLE MINING CO., St. Louis, Mo., 1000 tons of No. 7 mine, Miller, Ill., $1.54; total, $1540.

SOUTHERN COAL MINING CO., St. Louis, Mo., 5000 tons Little Oak, Shiloh, New Braden run-of-mine coal, $1.38.

CAIRO CITY COAL CO., Cairo, Ill., 4000 tons Paradise run-of-mine coal, $2.25.

MONONGAHELA RIVER CONSOLIDATED COAL & COKE CO., Pittsburgh, Penn., 1500 tons, Cypress Creek, $2.52; 200 tons, same, $2.75, delivered Rosedale, Miss., 400 tons, same, delivered Baton Rouge, La., $3.93; 1000 tons Youghiogheny coal, delivered Vicksburg, Miss., $4.24; 400 tons, same, delivered Natchez, Miss., $3.25.

WEST KENTUCKY COAL CO., Sturgis, Ky., 1000 tons Treadwater coal, delivered Greenville, Miss., $3.50.

Address B. McD. Townsend, Colonel, of Engineers, United States Engineer's Office, Custom House, St. Louis, Mo.

Contract No. 38—Hamilton, N. J.—This contract (p. 1048, Vol. 6), which provides for furnishing the pumping station of the Standard Oil Co. with 5000 tons of No. 1 buckwheat coal for delivery during the year 1915 in monthly proportions, has been awarded to the Knickerbocker Fuel Co. Address J. L. Hutchison, Coal Purchasing Agent, 26 Broadway, New York.

Contract No. 41—New York—This contract (pp. 108, 149), which provides for furnishing and delivering anthracite broken coal to the Brooklyn Bridge, has been awarded to John F. Schmadeke, at $3282. Address Department of Bridges, Municipal Building, New York.

Contract No. 51—Buffalo, N. Y.—The following bids were received by the Lighthouse Inspector, 10th District, Buffalo, for furnishing 200 tons of bituminous lump coal for the lighthouse tender "Crocus": Bert D. Smith, Sandusky, Ohio, $2.90 (awarded contract); Hunt & Weis, Sandusky, $3.25; Frederick Groch Coal Co., Sandusky, $4; C. A. Neilson Coal Co., Sandusky, $2.95. Address Lighthouse Inspector, Buffalo, N. Y.

CONTRACT NOTES

It is understood that J. L. Hutchison, coal purchasing agent for the Standard Oil Co., 26 Broadway, New York, closed a contract recently for upward of 1,000,000 tons of anthracite coal in steam sizes, the greater portion of the contract going to the Lehigh Valley Coal Sales Co.

In the matter of the recent large contracts entered into between the Elkins Coal & Coke Co. and the Lehigh Coke Co., regarding which the daily press has had much to say recently, it has been ascertained that this was considerably enlarged upon. There was no new contract made, but simply an extension of a contract which has already been running for three years for an additional three years more.

CONSULAR NOTES

Reliable concerns desiring to get in communication with the parties mentioned in the following notes may obtain blank application forms from "Coal Age."

An American Consular Officer reports that a business man in southern Europe desires to import coal. Correspondence should be in Spanish, if possible, and the consular officer requests that his office be supplied with duplicate copies of any catalogs that might be forwarded to this party.

An American Consular Officer in Europe reports the name and address of a firm in his district which desires to receive quotations on American coal c.i.f. destination for industrial and household purposes.

An American Consular Officer has been advised by a business man in Southern Europe that he desires to communicate with American exporters of coal, with the view of representing such firms in that market. Prices are to be quoted c.i.f. destination, and to include insurance against war risk and the agent's commission. Payments are to be against documents presented at local banks. Correspondence, if possible, should be in the Italian language. References can be furnished.

FOREIGN MARKETS

GREAT BRITAIN

Prices advanced. Railroad movement slow and deliveries are uncertain and irregular. Production reduced.

London, Jan. 8—The London coal trade continues very brisk. Public prices were advanced 24c. per ton on all qualities from Thursday morning. Coke was advanced 48c. per chaldron on Tuesday last. Railway deliveries have been exceedingly irregular, and consequently shortage at depots has become serious.

For the time being, the great difficulty now experienced in all districts regarding railway traffic chiefly occupies the attention of those connected with the coal trade. Not only is the scarcity of wagons most pronounced, but even when on the line delivery is very uncertain. The limited production brought about by various causes is now finding a reflex in prices; in several districts advances have been made, and in the other cases the quotations are very firmly maintained.

The average value of coal, coke and manufactured fuel exported from the United Kingdom during December was $3.22 per ton, as compared with $3.38 in December, 1913, and $3.17 in December, 1912.

The value of exported fuel during the completed year was $3.27 per ton, as compared with $3.36 and $3.05 per ton in the corresponding periods of 1913 and 1912 respectively.—"The Colliery Guardian."

Jan. 8—Owing to tonnage scarcity the market is somewhat easier for prompt loading while for forward shipment there is little doing at the present time. Quotations are approximately as follows:

Best Welsh steam.......	$4.92@5.04	Best Monmouthshires....	$4.26@4.32
Best seconds...........	4.62@4.74	Seconds................	4.14@4.20
Seconds................	4 38@4.50	Best Cardiff smalls......	3.12@3.24
Best dry coals..........	4.56@4.80	Cargo smalls...........	2.52@2.76

The prices for Cardiff coals are f.o.b. Cardiff, Penarth or Barry, while those for Monmouthshire descriptions are f.o.b. Newport, both net, exclusive of wharfage and for cash payment.

Freights—The scarcity of prompt tonnage having become more pronounced rates have risen considerably and the tendency is towards further improvement. Rates are approximately as follows:

Rouen...........	$3.06	Genoa, Savona...	$5.28	Las Palmas......	$3.36
Gibraltar.........	3.60	Naples..........	4.92	St. Vincent.......	3.60
Malta............	3.72	Venice, Ancona...	6.00	Rio Janeiro......	5.28
Marseille....	4.20	Alexandria.......	6.48	Monte Video.....	4.80
Algiers...........	4.00	Port Said........	6.48	River Plate......	5.04

Exports—British exports for December and the past three years were as follows:

[1] Includes Azores and Madeira. [2] Including Anglo-Egyptian Sudan. [3] And dependencies. [4] And Canaries. [5] West Africa.

GERMANY

According to reports by the Rhenish-Westfalian Coal Syndicate, the situation, which was naturally affected at the beginning of the war, has steadily recovered, as indicated in the table of the daily average output and sale given below.

These figures indicate that the output as well as the sale has increased from month to month, the increase of sales being somewhat more rapid than that of the output.

The following is a comparison of the production and sales for August, September and October, 1913-14 in short tons:

	Output		Sales	
Month	1914	Loss,* Per Cent.	1914	Loss,* Per Cent.
August	161,316	46.7	128,055	57.7
September	192,239	35.6	186,847	37.1
October	202,994	30.3	201,433	28.5

*Indicates the loss as compared with the same month in 1913.

COAL FREIGHT DECISIONS

Investigation and Suspension Docket No. 420—Switching charges on coal and coke within the Chicago switching district.

Proposed increased rates on bituminous coal and coke from points in Ohio, Pennsylvania, Virginia and West Virginia to Chicago & North Western stations, Peterson Ave., Crawford Ave., Weber and Greenwood St., not justified in full. Reasonable maximum rates prescribed.

Westinghouse Electric Direct-Current Motor and Pump mounted on a skid for lowering down inclines.

Westinghouse Electric Self-Starting Direct-Current Motors for Mine Pumps

These motors form the most satisfactory drive for small pumps in coal mines equipped with direct current.

They are similar to standard motors except that they can be connected directly to the line and require no starting box.

In starting these motors it is only necessary to close a circuit breaker in the power house or at some other convenient location; there is no need of visiting each pump and starting each by hand.

Another advantage lies in the fact that these motors start automatically on the return of power after a temporary failure of voltage, thus insuring operation at all times without individual attention.

Since there is no starting box and resistance, the connections are of the simplest possible character, a switch being all that is required.

These motors have been in successful operation in coal mines for several years and many re-orders from users prove their satisfactoriness in service. They are built in sizes up to 20 h.p. for all commercial direct-current voltages.

Full information sent on request.

SOME NEW ELECTRICAL MINING APPARATUS: *Page* 201
COAL AGE, Vol. 7.

COAL IN NORTHERN MONTANA: *Page* 201

THE NEW KNOWLEDGE OF COAL AND ITS PRACTICAL APPLICATION: *Pages* 202-205

The author says that the loss due to the needlessly inefficient use of coal, after it is mined, costs this nation at least $240,000,000 a year. He suggests that partial carbonization of coal, with saving of byproducts, should be one of the industries of the country. We should not only make coke but also partially devolatilized coal. Horace C. Porter. COAL AGE, Vol. 7.

The Subscribers' Forum

Conducted by the Business Manager of Coal Age

Devoted to weekly discussions, interviews, etc. on
the important subjects of your business and ours

YOU men, whose duty it is to investigate, select, and buy equipment, machinery and supplies for your mines, will be interested in this letter from Edward G. Epple, General Superintendent of the Queen Coal and Mining Co., of Jasonville, Ind.

Mr. Epple says:—"Please mail me the bill for the subscriptions of my mine boss and mine electrician, as I want them to read your paper and consider that I am making a profitable investment when I present them with their subscriptions.

"During the past year I have purchased equipment from the General Electric Company (three mine locomotives), and from the Cincinnati Frog and Switch Company (some 300 switches and 5 cross-overs, for our mines Nos. 2 and 4).

"Both purchases are thoroughly satisfactory in every respect and were originally suggested to me by a Coal Age advertisement.

"I may add that I consider your advertisements of as much value to me as your editorial work, and experience as an active superintendent and purchasing agent has taught me the reliability of your advertisers."

You see the man on whose shoulders rests the responsibility of spending company money for new equipment wants and needs all the guarantee he can get.

And nowadays men realize that products advertised in a high class technical paper are reliable and honest in quality—otherwise they couldn't buy space in such a paper at any price.

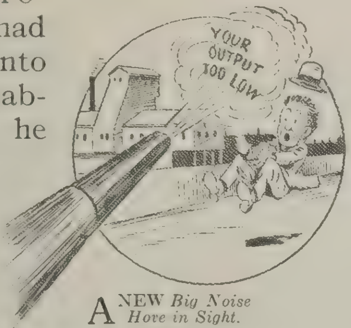
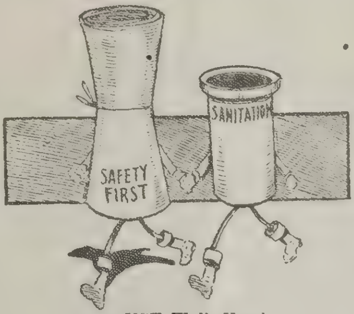
The Fable of the "Supe" and the New "Big Noise"

Once upon a time there dwelt in a mining camp a supe who posed as the "chief squeeze" around that dump, and inasmuch as he had for many moons deftly extracted from the coffers of the company his stipulated number of simoleons, it had grown into such a habit that he had entirely lost sight of the value-received part of the bargain. As a picture of contentment, he had everybody backed up against the wall and gasping for breath.



A NEW *Big Noise Hove in Sight.*



MUST *Walk Hand in Hand.*

SEEK YE YOUR MINING JOURNALS
WISDOM

AT *the Temple of Wisdom.*

And it came to pass that a New Big Noise—a 42-centimeter—hove in sight, cast anchor and trained batteries on the supe. Could he believe his ears; the first discharge sounded like this: "Your output too low; your cost too high; your camp the bummest burg I have seen in a decade. Get busy; come across with some reasons why."

With his first line of fortifications all shot to pieces without a return volley, the dismayed supe fell back on the inner works and pulled off something in a wee small voice that sounded like: "Located too far from town; labor scarce."

"Labor scarce! Ha! Ha!" boomed the 42-centimeter. "Know ye not, oh many times mistaken supe, that the modern miner stayeth not where the turn runneth slow. Verily, also, must there be education for his children; physical and moral welfare work must prevail; sanitation and safety first must walk hand in hand. You are in a rut. Come out of it, for verily I say unto you not one amongst ye hath a strangle hold on his job. Your looks seemeth that of a man sick almost unto death — a vacation for you. Brush up; remodel yourself. Get a death grip on some late and imported wisdom lest very much worse things befall thee."

Wearied with his long journey the supe approached the Temple of Wisdom, made deep obeisance to the high priest of knowledge who presided there, and spake with feeling:

"Oh, most wise and beneficent sage, greatly am I troubled. My new boss findeth much fault with me. Verily have I lost my grip.

"I must show a complete reversal of form, and 'then some' in the very near and immediate future, for trouble and disgrace dog my footsteps. I fain would acquire knowledge, and would learn the way."

"Son," quoth the sage, "return ye to your own country for knowledge lies not far distant. Seek ye your mining journals that have accumulated with wrappers undisturbed for weeks and months. Read carefully and profit thereby.

"Drink to the full of this fountain of facts, for therein lie the fruits of ripe experience, which is true wisdom."

—By C. P. Shockley.

Moral:

OPPORTUNITY *is on your trail; duck or he will catch you.*

The Main Island Creek Coal Co.'s No. 4 Tipple

By H. Reisser*

SYNOPSIS—Details of a modern steel tipple having three kick-back dumps and an elaborate arrangement of screens. The mine has four drift openings. Method of disposing of refuse. Drives are started and stopped automatically.

Situated at Omar, on the Guyandotte Valley Branch of the Chesapeake & Ohio R.R., about 9 miles from Logan, in Logan County, this tipple was recently completed.

The Main Island Creek Coal Co., although comparatively new, has one of the largest tracts of rich coal lands in the Logan district, and is increasing its tonnage rapidly. The No. 4 tipple has one of the largest capacities of any such plant so far started. The coal seam, which lies some 75 ft. above the elevation of the railroad tracks, is the famous Island Creek bed. It is 8 ft. thick, has few impurities, makes blocky coal, and is used both for domestic and stoking purposes.

Showing Pickers at Work in the Conveyor House

Four drift openings have been driven into the seam at various points, all of which lead to the head house at coal elevation. Mine cars are brought from these openings to the dumping points with electric locomotives in 30-car trips.

The plant was designed and built by the Link-Belt Co., of Philadelphia, Chicago and Indianapolis, and following the general modern trend in bituminous-coal-preparing plants, the tipple and other buildings were made of structural steel and covered with corrugated iron, placing wood only as walks, stairways, etc., making the structures practically fireproof.

The plant is divided into three units: The head house, the conveyor and picking house, and the screening house.

The head house covers the three kick-back dumps, a 15-ton steel dump hopper and an apron feeder.

Equipment in the Head House

The apron feeder is made up of a standard Link-Belt corrugated apron mounted on two strands of steel-bushed roller chain traveling on angle tracks. At the end of this feeder, the coal discharges over a lip-screen discharge chute which removes all the "fines" and deposits same on the bottom of the apron conveyor. This feeder is driven by a chain receiving its power from the foot shaft of the apron conveyor down hill. A structural steel frame, mounted on concrete, supports the machine.

The Conveyor and Picking House

The picking house covers the 72-in. wide corrugated apron mounted on two strands of steel-bushed roller chain, which move down to the elevation of the shaking screens. The upper end is pitched downward at 30 deg., and at the lower end it becomes horizontal, giving the pickers a chance to remove refuse from the coal. This refuse is all in the larger sizes, so that it is easy to detect. The refuse and slate are disposed of by means of boxes at the table sides handy to the pickers which empty into one common refuse bin placed directly under the picking floor and discharged by a standard Link-Belt undercut gate into side-dump cars, which in turn deposit their load on the hillside.

---

*Engineer, Link-Belt Co., Philadelphia, Penn.

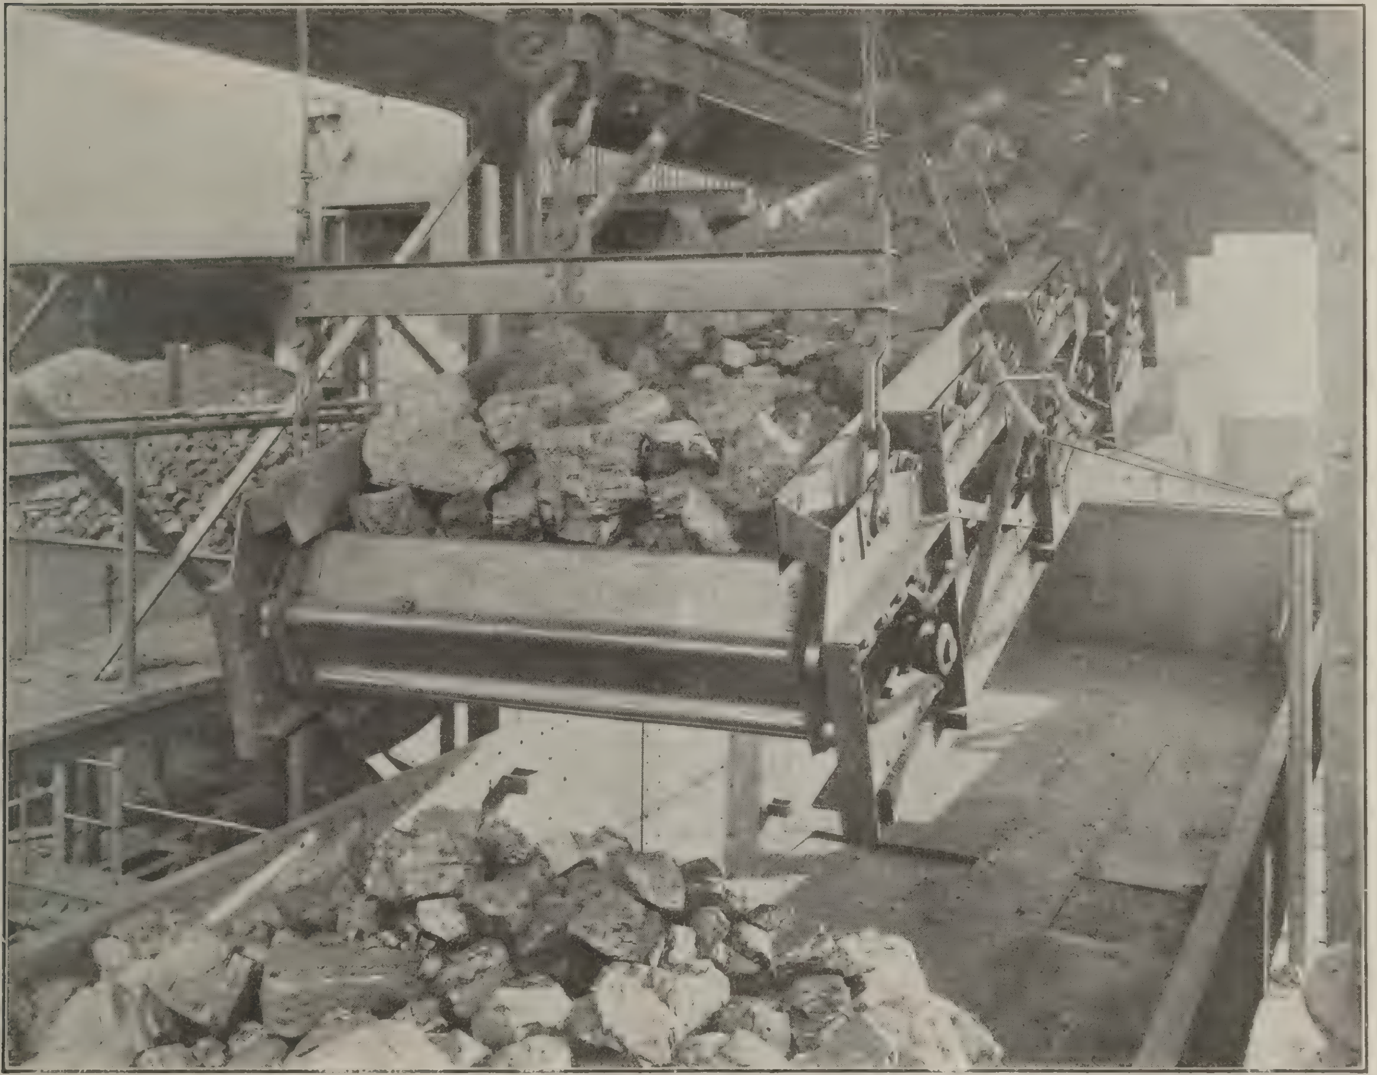
The Screening House

The screen house covers the shaking screens, chutes and lump-loading boom. The 72-in. wide corrugated apron conveyor before mentioned discharges over a ¾-in. perforated chute provided with a fly-valve. This chute when closed supplies boiler fuel, which is carried to the power house by side-dump cars; the remaining coal is discharged onto the shaking screens.

The hopper receiving this coal is designed with two compartments, the bottom of the main hopper being equipped with a bar screen to allow the fine coal going through the perforated screen in the discharge chute above the screens, into the boiler fuel bin. The main hopper is utilized for either slack (when making screened coal) or run-of-mine. The flow of coal at the discharge over the track is controlled by a standard Link-Belt undercut gate and adjustable end chute.

Shaking Screens

The shaking screens are of the usual rugged type, suspended in tandem with adjustable forged-steel hanger rods, 8 ft. wide, and prepare the coal in sizes, namely: Lump over a 4-in. screen on the outside track, egg over 1¾-in. screens on the middle track, and slack on the inside track. To accomplish these requirements, patented flanged-lip screens are employed, these being a decided improvement over the heretofore used perforated plate screens, due to the former having slotted taper holes to prevent clogging of slivers and due to the fact that every 12 in. the coal is turned.



View of Boom Topping Off a Lump Car

To make 4-in. run-of-mine, the upper screen is arranged with a removable one-piece rail, raised and lowered by hand winches, bolted to the screen itself when in use, and suspended over it when idle. This method has entirely eliminated the leakage of very fine coal, which is an annoying feature in screening plants, and the veil now forms an integral part of the screen when it is fastened to same.

The upper screen removes the product under 1¾ in., the same falling into the above mentioned combination slack and run-of-mine hopper. The lower screen removes the product over 1¾ in. and under 4 in., which passes into a shaking and attached gathering hopper from which it passes into curved adjustable chutes with extensions for low cars, controlled and operated by ropes and winches. The product over 4 in. size passes onto the lump-loading boom.

The screens are driven through ball-and-socket eccentrics and wooden rods to the eccentric shafts on which is placed a heavy flywheel pulley which counteracts any unbalanced motion of the screen. A belt drive connects this shaft to the common countershaft of the main drive.

The eccentric shaft is supported on an independent structural steel frame, which is designed in the form of an "A," and takes all the vibrations of the screens directly to the foundation, thus insuring rigidity and long life for the balance of the structure.

A Close View of the Sized Coal Made at the Tipple

The Drives

The drive for both the down-hill conveyor and the shaking screens is located directly under the discharge point of the conveyor, which through countershafts, cast and cut-spur gears and belt drives lead to the common countershaft, on which are located friction clutches, pulley, etc., so that one or both units can be stopped and started at will.

To eliminate electric troubles, two 50-hp. motors are used to drive both units which are located in the same arc of radius so that in case one breaks down it is only a matter of a minute or two to change the belt to the remaining motor.

Automatic starting and stopping push-button stations are located in different points of the tipple. Such stations are located in the head house on top, the picking house, and at the loading tracks below, allowing the motors to be stopped at the several points in case of trouble. The plan provides that motors can only be started from the point where they were stopped.

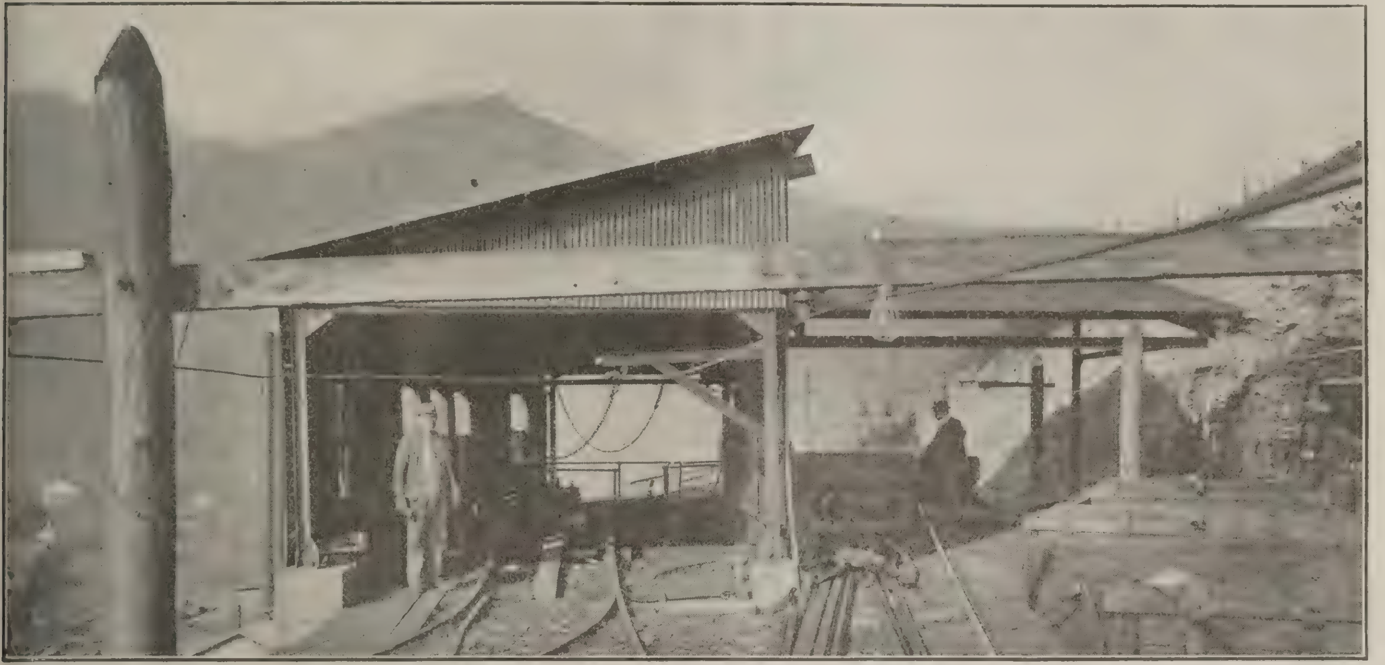
The Loading Boom

For the loading boom, a moving corrugated apron is again employed, constructed of the same style and type as described for the apron feeder and down-hill conveyor. It is moved on a short fixed horizontal steel frame, to the end of which is fastened the boom itself. A self-contained structural steel frame is the means of providing guides on which the apron moves, carrying the coal to within 6 in. of the bottom of the railroad car. The raising and lowering of the boom are accomplished with a 3-ton electric hoist, insulated, which insures quick action, and in turn few delays in loading the cars. The machine is driven through a countershaft, cast- and cut-spur gears, belt drive to 5-hp. motor and can be stopped and started at will by friction clutches.

In the design of the buildings, columns of the Bethlehem section were used wherever possible, making it an easy matter to repaint same, allowing no accumulation of the fine dust in inaccessible corners, etc., for such dust appears to have a strong corroding action on structural steelwork in general.

Trimmers' walks at the car sides are provided at all available points to give both the loaders and the car handlers ample means of going from place to place quickly, and throughout the entire equipment an abundance of light (both natural and artificial), walks and stairways are noticed.

The officers of the company are John Laing, president (former chief of the Department of Mines, West Virginia); A. J. Dalton, general manager; R. F. Carson, chief engineer; John A. Kelly, assistant superintendent, and O. O. Cooper, secretary and treasurer. The directors of the company are: Messrs. Clinton Crane, J. O. Cole, R. G. Huffard, Enoch Smith, L. E. Johnson, O. O. Cooper, J. E. Cox, James Dinet, W. A. Brown, J. F. Johnson, and James Prince.



THE HEAD HOUSE AND DUMPS

⁂

Sprinkler Systems for Wooden Breakers

Sprinkler systems that can be turned on by hand from outside the buildings are being installed in 14 of the wooden anthracite breakers of the Lehigh Valley Coal Co. and installations in two more are planned. Four of the breakers have already been equipped, and 10 are under way. At recent tests of these new systems before a Committee of the Underwriters' Association of the State of Pennsylvania, the Committee agreed to recommend a substantial reduction in the high rate of insurance now in force on these wooden breakers for buildings thus equipped.

It is almost impossible to enter a breaker which has caught fire. The conflagration is quick and hot, fed by the coal and the numerous drafts throughout the immense open structure. The new sprinkler systems consist of pipes 10 or 15 ft. apart with nozzles pointing upward at equal intervals which dash the water against concave circles of metal causing it to spread out in umbrella shape as it falls to the floor. The nozzles are so placed that the falls of water will overlap and cover the entire breaker building.

This system will throw 800 to 3000 gal. of water a minute, a quantity equal to from one to four fire hose throwing 750 gal. a minute. It will extinguish any small fire and prevent one that has gained headway from spreading further. Wooden breakers are extremely inflammable and a number of them have been burned to the ground. This involves not only a replacement cost of from $150,000 to $200,000, but the loss from the fact that no coal can be mined for many months from the shafts that feed the breaker, as the means of preparing the coal for market have been destroyed. These new systems supplement but do not replace any of the regular fire-fighting apparatus installed in every breaker, such as hose, standpipes, fire pails, sand pails, water barrels and hand grenades.

⁂

A Rapid Growth

An instance of the difference between efficient centralized management and that which is distributed and necessarily less efficient is coming to light in the case of the Sacandaga Coal Co. This company bought its first piece of property in March, 1913. It now has 600 acres of coal land and two miles of narrow-gage railway connecting up the properties in Mayfield and Carbondale. The annual output of the properties which the Sacandaga company acquired was a scant 30,000 tons. The work of the company is still in the development stage, but it has two breakers, Sacandaga No. 1 and Sacandaga No. 3, with a capacity of 250,000 tons a year. The output this year is expected to be 150,000 tons and by the end of 1916 the breakers are expected to be running at full capacity. This instance tends to prove that the efficient administration of coal lands has as much to do with success as advantageous location and easy mining.

⁂

Experiments made in France have shown that 10 per cent. more weight of briquets can be stored in a given space than of lump coal.

Mine Tracks

By Sheldon Smillie*

SYNOPSIS—Mechanical mine haulage is in reality a miniature railroad system and should be treated as such. Bonding, ballast and other details are all essential to satisfactory operation.

Mechanical haulage, particularly electrical, has been installed by many managers because they were told it was cheaper than the old system. They probably did not realize that they were constructing a miniature industrial railroad which should be treated as such. How many of these managers will tell you of armature troubles, bearings, tires, etc., which are making their lives shorter.

Tracks should be as straight as possible. There is no reason why they cannot be laid to the same sights upon which the entry is driven, and not made to go around every little knob the cutters leave. They should be laid evenly, the ties being tamped up to the rail, not the rail drawn down to the ties.

Heavy rails are desirable because they bend less easily and offer a greater surface to the tires. Most locomotive makers recommend a certain size of rail to be used with a certain weight of machine. This rail sustains the locomotive when the ties are spaced 2-ft. centers.

Tracks should be kept clean down to the ties. How many mines one has been in where there is a mound between the two rails, possibly scored in the center by the brake rods of the locomotive, the flanges of the wheels making a groove along the rail with water running over the same in spots and down these grooves. Dirt increases the resistance of the cars and holds the moisture on the rail, necessitating sanding. The sand in its turn piles up around the rail, making matters worse. Tracks are easily kept clean when frequently attended to and the cleaning generally pays for itself in decreased boiler coal.

The grade of the main haulage should be watched carefully. A short piece of adverse grade will limit the capacity of the locomotive. The work of leveling up will be more than paid for by the increased number of cars hauled per trip.

Locomotives are designed to pull a certain load at a certain speed over the average grades in the purchaser's mines with allowances for short stretches of maximum grade. These data are usually furnished the manufacturer by the engineering department, which usually forgets to furnish the mine foreman with the same figures also. The result is that when the machine arrives it is set the task of hauling the coal out of the dip, the motorman adding cars until he can just crawl over the hump while piling sand on the tracks.

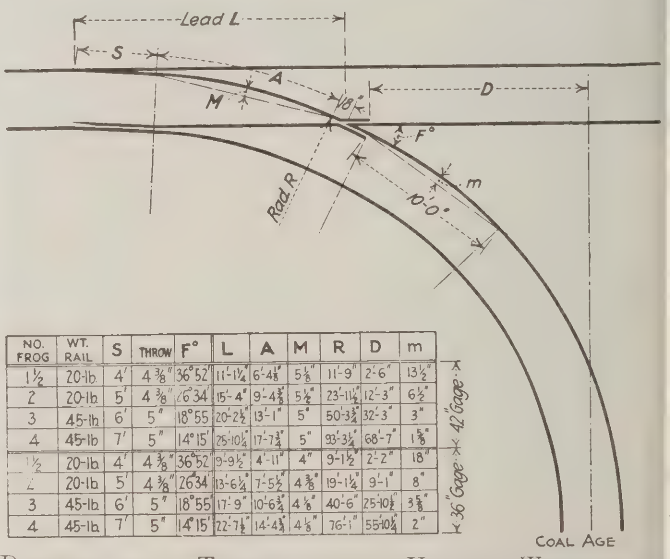
He would have saved time by making an extra trip or two at the capacity designed and the mine foreman would not call up the general manager in a few days and report, "That new Jordan locomotive is no d—— good. Order us a set of armature coils, a set of brushes and controller fingers and segments. Yes, and get some resistance grids too."

With the proper load and dry tracks, no sand should be required except on starting. Sand increases the resistance to the return current, and where much of it is used it frequently gets spilled all over the top of the locomotive and works down into the bearings, particularly the journal boxes, cutting them rapidly.

My experience has been that most motormen sand vigorously, thinking to gain speed thereby, when the trouble is actually too steep a grade for the load. A little grit is all that should be necessary and my opinion is that a number of companies could substitute a cheap river or bank sand and find that they use no more of it than the more expensive siliceous or glass sands.

Low voltage is probably the cause of most electric-locomotive troubles, and while this may be caused by remoteness and too small a feeder, the trouble can usually be found in the rail bonding. Rail bonds are the most important and most neglected feature of electric haulage. Almost every electrician has his opinion as to the best kind of bond and every maker has his "pet" pattern, but I believe the short, flexible, concealed type properly pressed into a freshly reamed hole is the best. To secure first-class results the fishplate should be tight and the joint supported by a well tamped tie under the end of each rail and under the fishplate.

Joints should be inspected with a bond tester every two weeks. A few defective ones will be found and the trackmen will soon learn the cause of failure and use more care in putting in the new ones.



NO. FROG	WT. RAIL	S	THROW	F°	L	A	M	R	D	m	
1½	20-lb.	4'	4⅜"	36°52'	11'-1¼"	6'-4⅛"	5⅛"	11'-9"	2'-6"	13½"	42" Gage

4	45-lb.	7'	5"	14°15'	22'-7½"	14'-4¾"	4⅛"	76'-1"	55'-10¼"	2"	

Dimensions of Turnouts with Various Weights of Rail on 36- and 42-In. Gages

A good method of getting a general idea of the condition of the bonds is to figure the feeder resistance and consequent drop in voltage due thereto to some remote corner of the mine, and then measure the actual drop at that point between feeder and rail. The difference between figured loss and actual is the approximate loss due to the resistance of the return. This will usually be many times that of the feeder.

It is a poor scheme to bond over to the water or air pipe with a view of using that as a return, as the varying resistance of pipe and track will keep the return current constantly passing from one to the other and back again, causing electrolysis and early destruction of the pipe. The best thing I have found where the tracks are in poor shape is to get an old haulage rope and lay it along the rib grounding over to it at frequent intervals.

---

*Division engineer, Rochester & Pittsburgh Coal & Iron Co., Indiana, Penn.

One of the quickest things to upset the regular routine of a mine and get the miners disgusted and ready to quit is to have the cars going off the track continually. Poor track laying is the cause of a good deal of trouble, but poor switches cause the majority of accidents. Herewith I give an original table calculated especially for underground conditions and for the frogs most usually employed. Small variations may be made from these figures without materially affecting the operation. The distance *D* is from the heel of the frog to the center line of the track at right angles to the main haulage on a curve equal to that of the turnout. It is the distance that the frog should be set back of the center line of the cross-entry or room. The middle ordinate of a 10-ft. chord of the outer rail of this curve is designated as *M*.

Curves should be banked in mines as well as on any surface line and for the same reason.

Time will often be saved by providing a regular switch stand with ground light showing which way the switch is thrown. A light should also be turned by the same motion in the side entry so that the motorman on a trip coming out will be able to see without stopping whether another trip has been by and thrown the switch while he was inside.

* *

Legal, Legislative and Labor Developments during 1914

By A. T. Shurick

SYNOPSIS—Supplementing the article in our Jan. 9 issue, on "Coal Markets and Business Aspects of the Fuel Industry in 1914," we give herewith a brief sketch of principal legal and labor developments of the year.

The Ohio Anti-Screen Law—Among the important legislation of the year, a period which, by the way, stands forth as one singularly replete with drastic lawmaking of all kinds, the enactment of the Ohio Anti-Screen Law is particularly important, and proved a crushing blow to the coal industry of that state. In the face of a most earnest protest from the operating interests, substantiated, it might be said, by irrefutable figures as to the ultimate results, Governor Cox and his radical following stubbornly persisted in their efforts, until the measure finally became a statute.

As was only to be expected, the constitutionality of the law was immediately questioned by the operators, and the matter hurried through the lower courts in order to obtain a decision from the Supreme Court as soon as possible. This latter tribunal at first sustained the law, but later withdrew its decision, and the matter was still in question at the end of the year.

The Hard Coalers—A continuation of the Government's proceedings against the alleged anthracite trust was a feature in the judicial circles during the year. The Department of Justice is now approaching this problem along new lines; it proposes to amend the National statutes in such a way that its actions may be carried to a successful conclusion. The very persistence which the Government is exhibiting in the prosecution of this suit tends to convince one that it is based upon substantial and well grounded reasons, and if it is successful in establishing its case, this combination should be dissolved. It must be remembered, however, that Judge Gray, in the United States Court at Philadelphia, found that no such combination existed, and his decision was later affirmed by the Supreme Court.

It is interesting to note in this connection, the inconsistencies of some of the statutes in effect in this country. Half a century ago, Pennsylvania enacted a law making it mandatory on the railroads of the state to assist in the development of the coal industry, whereas the present federal laws direct entirely to the contrary. In 1874 a change was proposed in the state constitution, but it was never put into effect and is still operative to this day.

The Anthracite Rate to Philadelphia—Among the several important decisions that marked the year's end, the heavy cut in the anthracite freight rate to Philadelphia stands out as one of the most drastic of the year. The decision was handed down by the Pennsylvania State Commission, whose jurisdiction, of course, covers the rate to Philadelphia, but not to outside points. The reduction was quite heavy, being 40c. per ton on all sizes above pea coal and scaling down to 20c. per ton on the smaller grades.

The decision is apparently based on the rather illogical hypothesis of a comparison with the New York rate, the haul to the latter point being longer and it being assumed, therefore, that the rate to Philadelphia should not in any event exceed that to New York. The Interstate Commerce Commission has long since proved the fallacy of arriving at an equitable rate by such means, and it is disappointing to find one of the state tribunals reverting to such methods which can only serve to excite the popular fancy of the ill-informed.

The Clayton Bill—The enactment of the so called Clayton anti-trust bill on Oct. 15 marked the end of a great deal of exaggerated comment and unnecessary alarm. Organized labor claimed that the passage of this law brought them relief in certain directions that they had long been striving for. While it is generally agreed that the wording and phraseology of the act are so confused in certain instances as to raise some doubt regarding just what interpretation may put upon it, there are conservative and authoritative attorneys who state that the claims of the labor parties are entirely exaggerated.

In fact, instead of exemption from the provisions of the Sherman law, the new act considerably enlarges the scope by which private individuals may bring action for violations of its provisions; thus, the right of triple damages for any injury as provided in the Sherman act is emphasized particularly in the fourth section of the Clayton act. However, should it so develop that the new law does not meet with the expectations of the labor party, it is, of course, only a question of time until they resume aggressive steps to gain this end.

The Five per Cent. Freight Rate—Among the constructive elements in the country's business affairs, the granting of the 5 per cent. rate increase to the Eastern roads, toward the close of the year, stands out prominently. Unfortunately, this was so long delayed that the practical benefits to the roads are inconsiderable, but the general tone of the decision was so eminently encouraging that it may ultimately prove a potent stimulus. Thus, the scope of the rates was extended beyond the territory of the roads making the application, while a close study of the report leads one to the conclusion that even more than the allotted 5 per cent. increase might have been granted in certain instances had it been requested. This change of sentiment and principle in which the commission at last recognizes the necessity of concessions for "the common weal," seems to be the most hopeful note yet sounded by the new administration.

The Government vs. the Lehigh Valley—The decision rendered by Federal Judge Hough, in the Government's dissolution proceedings against the Lehigh Valley Railroad Co., was quite favorably interpreted by the large business interests, though the Government has so consistently failed in suits of this nature that the results were already largely discounted. The action embraced no unusual features of any kind, the charge being an attempt to monopolize interstate commerce, and the transporting of anthracite coal in violation of the commodity clause of the Hepburn law. The Government appealed the case and it will be carried into the Supreme Court.

The Pennsylvania State Tax on Anthracite—In the case of the Pennsylvania State tax on anthracite coal, there were some 16 appeals taken to this ruling during 1913, but the case did not come up for trial. The operators are attacking the constitutionality of the law on several grounds, the principal ones of which are: That the tax is a special tax, and therefore not uniformly applied as required by the law; that the distribution of the revenues from the tax are not legal, and that it is unfair to impose a burden upon the steam sizes of anthracite to which the bituminous coals, with which they are in competition, are not subjected. The principle involved in this controversy is one of considerable importance, since it will establish a precedent by which all such questions of this character will be decided.

IN LABOR CIRCLES

A period of depression such as has characterized the country during the past 12 months inevitably works to the discomfiture of the labor unions. Such has been the case during the past year to even more than the usual extent, and this in spite of the fact that the National administration has shown a pronounced sympathy with the labor parties and has exerted its best efforts to assist them in every way.

By far the most important development in the labor history of the country for the year was the culmination of the Colorado strike in what cannot be interpreted as other than a crushing defeat to organized labor. International Vice-President Hayes of the United Mine Workers of America is on record with the statement "That the Union had spent $3,044,000 on the strike," and it will go down in history as one of the best organized and most determined attempts of this organization to unionize an "open-shop" district. Conservative estimates place the loss in life at 66 and the gross monetary consideration at approximately $18,000,000. Through the connection of the Rockefeller interest with the Colorado Fuel & Iron Co., the opportunity to involve the already muchly abused Standard Oil Co. in the fracas was eagerly seized upon. Demonstrations in the shape of "mourner's parades" occurred in different parts of the country, notably New York, which did much to create an unsavory and prejudicial publicity to the operating interests.

NEW AGREEMENTS NOT SATISFACTORY

Undoubtedly one of the main reasons for the collapse of the Colorado strike was the unsatisfactory results obtained in the new agreements negotiated in the Eastern bituminous fields, Apr. 1. The expiration of the old wage scales found the operators in an unusually strong position with the markets flat and completely devoid of interest; coal could scarcely be moved at any figure, nor did the future hold out promising hopes for much improvement. The producers were so obviously determined to close down their mines rather than concede the customary advances that the miners concentrated their efforts on a very few districts.

Thus, instead of uniform scales being arranged at the different main conventions, these broke up in complete disagreement, and the matter was taken up by sub-districts. In Illinois and Indiana agreements were effected without any great trouble, and the same was true in Pennsylvania, with the exception of a very few districts where the negotiations were more or less spirited for a time. But with the pronounced surplus of Southern coals in the market it was not to be expected that the suspension in the central Pennsylvania district could long endure. As a matter of fact, the "suspension" was at no time taken seriously, the miners good naturedly consenting to work whenever the operators really required tonnage.

But in Ohio, the enactment of the Green anti-screen law so confused the situation that the operators experienced great difficulty in reaching an agreement, and the close of the year found the situation in the No. 8 district becoming more and more acute, and replete with grave possibilities. The demand was made for a basing rate of 47c. per ton for machine mining, with no provision for lump coal. This was accepted by the Hocking operators, to whom it meant a slight reduction in the cost of mining, and the Cambridge producers were also forced to accede to the demand because of the large contracts they had on hand, but the No. 8 operators steadfastly refused to consider any such rate. Thus a new scale was reached in some of the more important districts, but sections aggregating perhaps one-half the gross tonnage of the state were still out at the close of the year.

The enormous expenditures of the miners' organization in Colorado also interfered with the payment of benefits to the idle union men in Ohio during the early part of the suspension and considerable dissatisfaction was reported from many of the mining districts; this situation was somewhat relieved by modest donations toward the close of the year, but the miners have reached a point where their leaders are holding them in line with the greatest difficulty, and there are well defined rumors of internal dissension in the organization.

A New Rotary Air Compressor

A new air-cooled rotary air compressor has just been placed on the market by the Wernicke-Hatcher Pump Co. of Grand Rapids, Mich. A machine of this type, weighing 1400 lb., and being 46 in. long, 28 in. wide and 35 in. high, operating at 400 r.p.m., delivers about 75 cu.ft. of air per minute at 100 lb. gage pressure.

The machine, which may be built for either belt drive or direct connection to a motor, consists essentially of wo elements, a rotor and a rotor casing, both of which volve in the same direction and at the same speed, but pon independent shafts, which are eccentric to each her. At suitable intervals, plates or vanes extend radily from the surface of the rotor, fitting into slots in the sing and case head, and dividing the displacement of e compressor into independent pockets. These plates e pivoted to shoes which are so arranged as to slide the surface of the rotor.

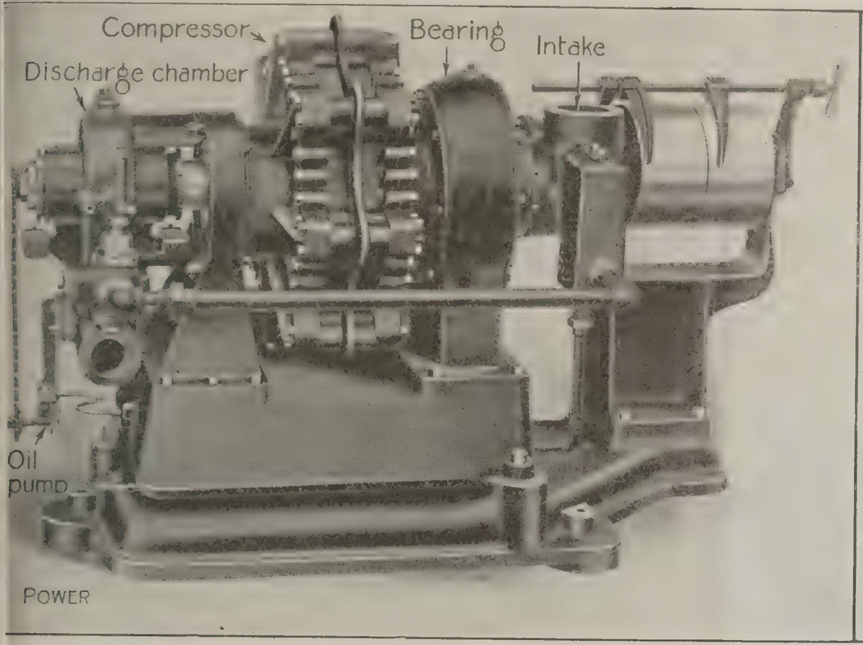

Fig. 1. Wernicke-Hatcher Single-Stage Rotary Air Compressor

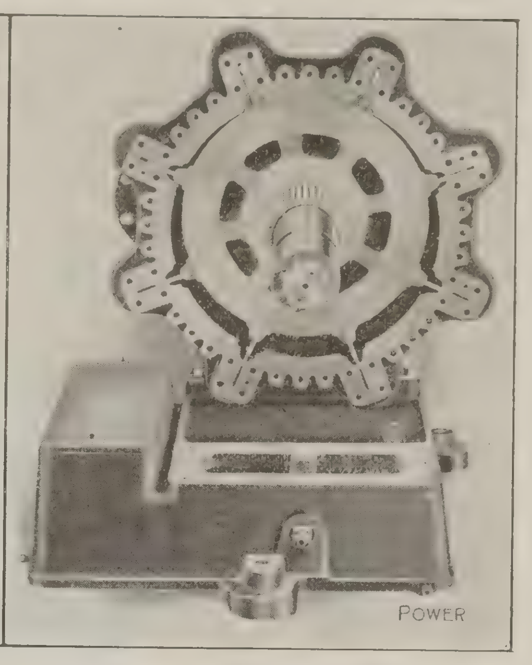

Fig. 2. Discharge End with Rear Bearing Bracket and Case Head Removed

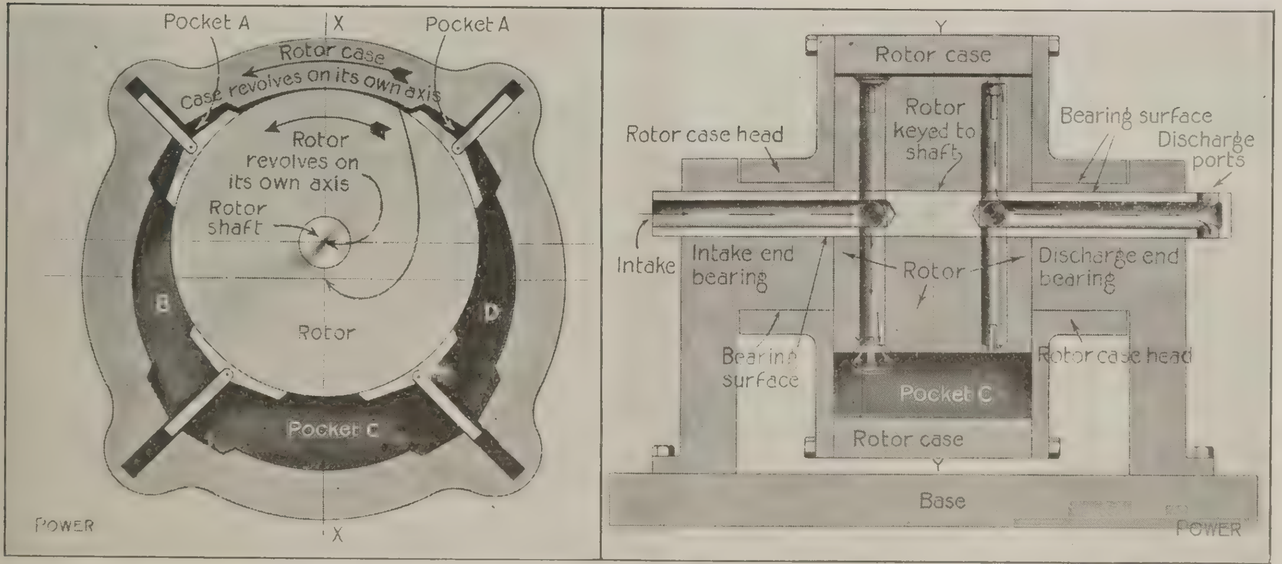

Fig. 3. End and Side Sectional Views, Showing Positions Taken by the Elements

The plates or vanes slide back and forth in the slots, but as the elements rotate in the same direction, this movement is relatively slow. This permits a close fit on the side walls, and as the pressure in the leading pockets during compression is always greater than in the pockets behind, the plates are pressed against the faces of the slot, causing little or no leakage to the chambers of lower pressure. Through one-half of the revolution, each pocket is expanding and drawing in air; through the other half, it is contracting in volume and discharges the air when the latter has reached the pressure of the receiver.

With eight pockets, there is practically a continuous compression, the periods of operation overlapping each other, so that the air is discharged practically uniformly at the desired pressure. This gives a uniform torque on the drive shaft, and as the machine is equipped with roller bearings, the friction is low. The cooling surface is afforded by the rotary casing. In proportion to the volume of air compressed, this surface is unusually large, nor is it contracted during compression.

On this account, much of the heat generated is immediately radiated, and on an all-day run, it is reported that the temperature will not exceed 300 deg. F. Water cooling is consequently unnecessary.

Each pocket of the machine is provided with an intake and discharge valve. These are of the ordinary poppet type, and connect through suitable passages with the intake and discharge openings located at opposite ends of the hollow rotor shaft. The intake valves are mechanically operated by a stationary cam, while the discharge valves are automatic. A suitable unloader protects the machine, and allows it to run idle except when air is being used.

Extracts from a Superintendent's Diary

Occasionally a derelict drifts into our camp and attempts to find anchorage. The attempt is generally successful.

We buried such a one today.

Although Tom James has lived in our midst almost a year, it required his death to make us realize that we do not know a single fact in regard to his personal history previous to his arrival in our community.

Every man who has been associated with him in any way has been questioned and we find no clew to help us to discover possible relatives or friends, and so we were obliged to bury him without notifying kith or kin. To them his fate will probably forever remain a mystery.

When he applied for a check number, on first going to work, he remarked to our timekeeper, grinning pleasantly the while, that Tom James might be his name, which leaves little room to doubt that we do not even know his name.

And yet in spite of these facts, as I now recall the incidents of the past year, this man's personality has left an indelible impression with me. Truly! "what is in a name?"

The mystery surrounding his early life, which has just now become common gossip, has been greatly emphasized by the incident which was responsible for his death.

The faithful ladies of our only church decided upon a box supper as a possible means of raising funds with which to purchase some much needed seats.

The popularity of the affair exceeded their expectations, and it soon became evident that more chairs were required to take care of the people. Tom being janitor of the church (a position which carried no salary or perquisites, and at times not even a "thank you, sir," for his pains) was asked to go over to my office and request the loan of a few chairs; the ladies knew that I could be found at my office because my wife happened to be one of the ladies, and she had left me at the office, under protest, to worry over some unsatisfactory cost sheets.

Tom informed me of his mission, and obtaining my consent, proceeded to dust off a few chairs. On one of these, he happened to notice an open copy of a weekly. On it was a picture of a gay youth dining with a "painted lady," at a table well supplied with lobster and wine. The youth was pictured as smoking and the smoke from his cigarette had formed a cloud, and in the cloud appeared (to the youth) a vision of a country maiden sitting at a table with bowed head. The title of the picture was "Waiting."

I noticed that the picture seemed to take possession of Tom but I could not realize what it would lead to. He left my office carrying the chair on which he had discovered the weekly and the picture was still lying on the chair seat undisturbed.

He never got back to the scene of the supper.

Between my office and the dwelling houses, the road follows along a sheer precipice and Tom's body was found at the foot of this precipice at daylight the next morning.

He still clung to the chair although its legs, like his were terribly splintered.

The derelict had sighted land and then in the twinkling of an eye sank forever.

And yet some people insist that fate is a myth.

Explosions in Flour Mills

Surely some consideration of methods pertaining to th prevention of dust explosions is called for. It has alread developed from laboratory study that most, if not all grain dusts are more inflammable than standard coa dust. Grain dusts in most cases develop higher pressure on explosion, especially at the lower temperatures. Th preliminary observations seem to indicate that the dust from oats and yellow corn are more inflammable tha those from wheat and other grain.

The investigations of the Millers' Committee indicat a difference in the inflammability of dried and undrie dusts. In nearly every case the pressure developed on ex plosion was increased appreciably after drying. The r sult of a decrease in the humidity of the air is thus sug gested.

Various causes have been assigned to the many e plosions in milling plants in this country and abroa among them the use of open lights, or naked flames, suc as lamps, torches, gas jets, lanterns, candles, matches, etc property fires; introduction of foreign materials in grin ing machines; electric sparks from motors, fuses, switche and lighting systems, and static electricity produced friction of pulleys and belts, grinding machines, etc.

The field-engineering inquiries of the Buffalo invest gators indicate that a large number of the recent expl sions and fires have been caused by the introduction foreign material into grinding machines. A possib means of prevention would be some system by which fo eign material might be removed before it reached the mi For the present, it is recommended that prevention of e plosions may be assisted by complete electric-lightin systems and the use of portable electric lamps instead lanterns or naked lights.

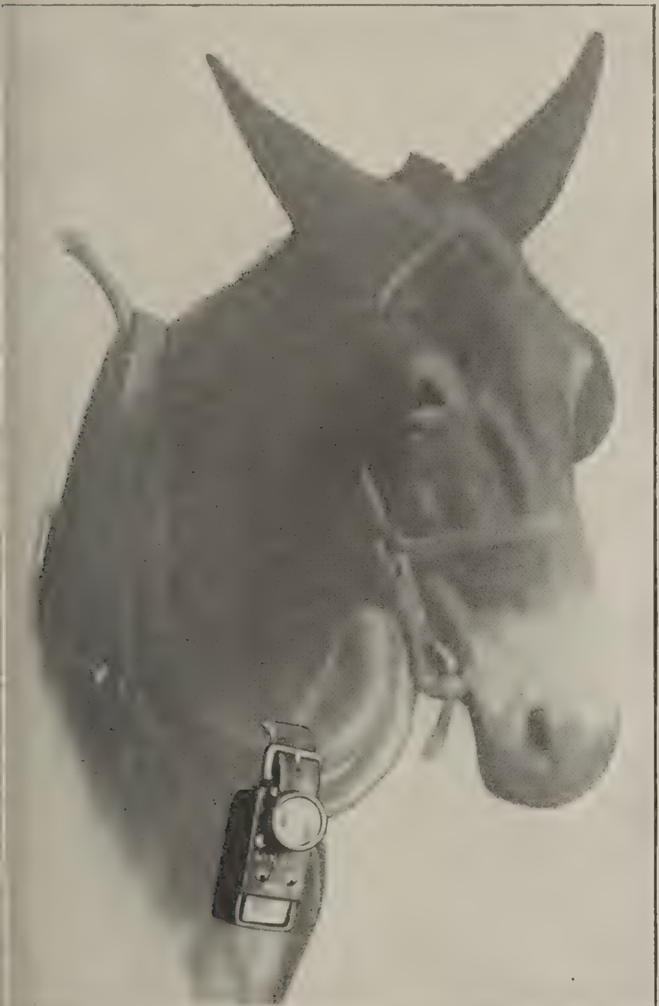
The Committee also advises that the receiving bins fro the grinding machines be as small as the operations pe mit, as increased size gives increased space for du clouds, and, therefore, opportunity for a more violent a destructive explosion.—*"The Journal of the Americ Medical Association."*

According to the Millers' Committee of Buffalo, in explosions which have occurred in grain mills in rece years, 78 men were killed and 119 injured. The dama to property exceeded $2,000,000. In four explosions Europe since 1911—two in dextrin works, one in a pr ender mill grinding peas, beans and wheat, and one i linseed mill—there were 47 killed and 119 injured.

Some New Electrical Mining Apparatus

Of all the senses with which animate creation is en-lowed, that of sight is probably of the most benefit. It s the sense which is employed the most continuously to lirect the movements of both man and beast. Unfor-unately, however, the eye can receive no impression and ransmit it to the brain in the absence of a greater or esser amount of light. Without light the sense of sight s useless.

Those who have attempted to travel even a well known assage through the mines without the aid of light of ome kind, can appreciate how nearly perfect and absolute the absence of light underground, and also how thor-ughly and implicitly man depends upon his eyes to uide his ordinary movements. And what is true of a an in this respect, is also true of an animal, although, erhaps, in a modified degree.



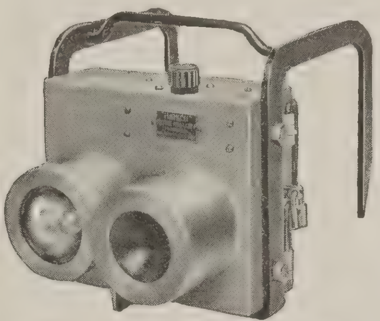
The Electric Mule Lamp in Position

In the past the light mostly used in mining was the oil rch, which burns with a long and smoky flame, and al-ough probably many attempts have been made to util-e such a lamp to aid man's best friend underground, the ine mule, such attempts have almost universally met ith failure. All animals fear fire.

Since the advent of the small and portable storage bat-ry, and the development of the efficient low-voltage in-ndescent lamp, the necessity for the old smoky long-flame oil torch has been removed. Mr. Douglas, stable boss of the New River Consolidated Collieries Co., at Eccles, W. Va., has devised a mule lamp of the storage-battery type, the rights to manufacture which have been given to the Hirsch Electric Mine Lamp Co., of Philadelphia, Penn. This lamp is identical in principle with the miner's cap lamp, except that the light bulb is attached directly to the storage battery, in this respect resembling the storage-battery hand lamp. A strap suitably arranged suspends the lamp and battery from the collar and hames of the harness, and the light thus hangs at a point where it will illuminate the mine passages to the best advantage, so far as the mule is concerned.

It is claimed that mules carrying this kind of light are much surer footed than are animals not thus equipped. Many accidents to mule flesh are thus avoided and the animal goes at his work with a greater willingness. Consequently more coal may be hauled out. The drivers, furthermore, are enabled to do more work and that under safer conditions.

In addition to the mule lamp just described, the above named company is placing upon the market a combination trip light and bell, which can be distinctly seen and heard at a distance of 500 ft. This is ruggedly built for the rough handling of the mines, and is claimed to be an effective accident preventer. A combination trip light and horn has also been developed, which it is claimed is reliable under all conditions and gives a shrill warning of the approaching trip.



The Combined Lamp and Horn

Another appliance, which is largely in the form of a safety device, is a storage-battery trip lamp, or tail lamp with a bright red reflector. This serves as a danger signal without the confusion commonly experienced with the ordinary type of lamp, or the oil-burning torch.

*

Coal in Northern Montana

The coal of the Cleveland field, Blaine County, Mont., is described by C. F. Bowen in a report issued by the United States Geological Survey in Bulletin 541-H.

Practically all the coal of the Cleveland field occurs north of Peoples Creek, in the northern part of the state. As the surface is covered by glacial drift the coal beds are, as a rule, exposed only in the coulees where the drift has been eroded. At these places they are thin and are commonly separated by shale partings.

The coal has been opened at a few places by ranchers, and in Sec. 35, T. 30 N, R. 20 E, there is a small mine operated in the winter, which produces about 600 tons of coal a year. The coal is similar in quality to that in the Milk River field, in the vicinity of Chinook.

*

The question of temperature has an important bearing in all tests and calculations on electrical conductors, since the resistance varies directly with the temperature. The resistance of copper wire increases about 0.23 per cent., and that of iron wire about 0.28 per cent. for each additional degree Fahrenheit.

The New Knowledge of Coal and Its Practical Application

By Horace C. Porter*

SYNOPSIS—The author says that the loss due to the needlessly inefficient use of coal, after it is mined, costs this nation at least $240,000,000 a year. He suggests that partial carbonization of coal with saving of byproducts should be one of the industries of the country. We should not only make coke but also partially devolatilized coal. Some coals exposed to heat promptly give off large quantities of volatile matter, yet in the long run their carbonization may not provide as much volatile matter as coals which break down less speedily.

At least 80 per cent. of the total power operating modern industries is derived from the combustion of fuel. Coal and the coke and gas made from it constitute 85 per cent. of the industrial fuel of America.

The proportionate cost of power to other charges for production varies widely in different industries, but taking them as a whole, the census reports show that fuel constitutes about 8 per cent. of the operating costs, exclusive of the cost of materials, in manufacturing industries. From this the importance of efficiency in the use of fuel becomes at once apparent, and it is made clear also by the fact that over 150,000,000 tons of coal are used for industrial power.

If the utilization of the energy of this coal were everywhere increased by 8 per cent., an increase entirely possible through the use of modern, improved, steam-engineering appliances and of the gas producer and gas engine, the cost of the industrial fuel used in the United States would be cut in two and at least $150,000,000 saved. If all the coke produced in the United States in 1913 had been made in byproduct ovens, $80,000,000 worth of byproducts might have been saved and the higher yield of coke would have resulted in a further earning of $10,000,000.

The United States Is the Largest Producer and Most Extensive User in the World

Coal is by far the biggest mineral product of the United States. The production in 1913 was about 570,000,000 tons and the bulk of this was consumed in our own land. The nation's coal bill was in the neighborhood of 1½ billions of dollars, or $60 for each wage-earner per annum. The United States is far ahead of other nations in coal production, having passed Great Britain, the nearest competitor, in 1899, and now surpassing her by nearly 100 per cent. Since we export but little coal and other nations a great deal, our home consumption surpasses that of other countries by even a much greater margin. Our industries are greater, to be sure, but we must face the fact also that an abundance of fuel resources has made us careless of efficiency in their use.

The coal reserves of this country are immense, the most recent estimates of the United States Geological Survey (for the XII International Congress of Geology, Canada, 1913) showing 1500 billions of tons easily available, not including the sub-bituminous and lignitic coals, these as yet not being widely used.

Purposes for Which Our Coal Is Used

The 570 millions of tons produced in the United States were used approximately as follows:

PURPOSES FOR WHICH COAL IS MINED

Purpose	Short Tons	Percentage
Domestic	120,000,000	21
Other heating of buildings	85,000,000	15
Coke and gas	75,000,000	13
Locomotives and steamboats	110,000,000	19
Industrial power (including central power plants)	180,000,000	32
	570,000,000	100

Scientifically the methods of utilizing coal may be classified into (1) combustion, (2) carbonization, and (3) gasification by partial combustion. Probably 80 per cent. of the coal consumption in America comes under the first class; that is, it is directly burned in air, and we see therefore the great importance of improving practical methods and appliances to assure efficient combustion.

Burning the Coal in Two Forms

In a combustion furnace using coal, all the coal and the intermediate products evolved from it are burned for their heating value only. On the other hand, the coke oven or gas retort utilized the coal more scientifically by converting it into two improved forms—fuel coke and gas—with a combined heating value about 85 per cent. of that of the coal, and in addition thereto saving the intermediate byproducts—tar, benzol and ammonia—which have a chemical value far exceeding their value as fuel. The coke and gas as fuels can be burned without smoke and with greater efficiency than the raw coal. A portion of the coke or of the gas, to be sure, must be used to supply the heat for carbonizing, this item amounting usually to from 10 to 14 per cent. of the original heat units in the coal.

It is not an idle dream to look forward to the time when there will be many central power and heating stations in the form of large byproduct coke-oven plants, placed at the mines or near large cities. As influences leading to this end, we may mention the following: Modern advances in long-distance transmission of electric power, the increasing demand for and value of coal byproducts for chemical purposes, the successful use of coke as a domestic and industrial fuel, the development of the gas engine, and the growth of public opposition to the smoke nuisance.

Devolatilizing Coal for the Market

Low-temperature or medium-temperature carbonization of coal has lately been introduced in Europe on an industrial scale. Coal is heated from 500 deg. to 700 deg. C (932 deg. to 1292 deg. F.), either under reduced pressure or in a current of auxiliary gas which passes directly through the coal, producing high yields of tars or oil and rich gas in small quantity. These processes depend for their commercial success on the quality and marketability of the oils and solid residues produced. Because of their adaptability to the recovery of oils, such as possibly motor fuels from coals not heretofore commonly used for byproducts, they offer an interesting field for industrial experiment in the United States.

---

*Chemical engineer, U. S. Bureau of Mines.

NOTE—Abstract of lecture delivered before the Department of Chemical Engineering, University of Pittsburgh, Pittsburgh, Penn., Nov. 9, 1914. The first of a series on recent advances in Chemical Engineering, given as an evening course largely to graduate students.

In the present commercial situation brought on by the European war, the lack of an adequate supply of creosote oil, largely a coal-tar product, is a big incentive to the increase of coal-carbonizing operations in this country. Sufficient coal tar and benzol can be produced from existing byproduct coke ovens and gas retorts to supply the present American demand for all other coal-tar products, creosote oil being excepted. But in view of the increasing use of benzol for many purposes and of the growing demand for coal-tar products of all kinds, there is an opportunity for a large expansion of the coal-carbonizing industry, in the near future.

Composition of Coal Still an Unsolved Riddle

Coal is a mixture of complex organic substances which are degradation products of cellulose, resins and gums, and vegetable fats and waxes. Free carbon has never been proven to exist in coal, and hydrocarbons are probably not present in an amount greater than 1 per cent.

The problem of the constitution of coal has been attacked chiefly by two methods: (1) Extraction with solvents, and (2) destructive distillation at low temperatures. Extraction, while it has resulted, by use of pyridine, in dissolving and removing 15 to 18 per cent. of the coal substance, has not separated any single definite identifiable compound in more than mere traces.

Destructive distillation also has led to no exact results, but it has given, on the other hand, certain well defined indications of the nature of the substances present. These are mainly that coal is made up of many complex substances, which have resulted from degradation or decay of plant cellulose, lignose, resins and waxes. These substances in coal are closely graded into one another in chemical nature and composition, except that the cellulose and lignose group is probably more or less sharply distinguished from the resinous group. Within each group are substances in many different stages of alteration by aging.

Chemically the cellulose bodies are distinguished by their higher content of oxygen, by their tendency to combine with or absorb that element, and by their thermal decomposition into carbon dioxide and monoxide, water of constitution, and paraffin hydrocarbons. The resinous constituents, on the other hand, have a higher content of hydrogen and less of oxygen and decompose by heat into hydrocarbons and hydrogen with small quantities of carbon dioxide and water. The resinous bodies are contained most abundantly in the coking and mature coals of the Appalachian region.

Little or No Real Volatile Matter in Any Coal

The term "volatile matter of coal" is more or less of a misnomer, but serves as well as any other. There is probably little or no material in coal which is volatile without decomposition. What we call "volatile matter" is a mixture of vapors and gases resulting from decomposition of the coal substances by heat. Its composition depends on the kind of coal and also much on the temperature to which the coal is heated and to which the primary products are subjected.

By "primary products" are meant those which form first as the coal slowly rises in temperature. These are in order of their formation: Water, hydrogen sulphide, carbon dioxide, various saturated and unsaturated paraffin hydrocarbons and hydrogen. Many, in fact most, of the commonly known constituents of coal gas, coal tar and gas liquor, such as benzene, naphthalene, pitch and ammonia, are the products of secondary decomposition of these primary products.

Much "Volatile Combustible Matter" Cannot Be Burned

We see, therefore, that the volatile products of coal are not all combustible. From some bituminous coals, completely dried, we obtain by decomposition as much as 10 per cent. of noncombustible volatile matter, and from some lower-grade coals even as much as 15 or 18 per cent. So there can be no question that the term "volatile combustible matter" as frequently used is decidedly a misnomer, because from one-eighth to one-half of the volatile matter of coal is noncombustible. It is important to bear this in mind when comparing fuels, since those coals, the volatile matter of which is rich and smoky, are more difficult to burn efficiently than others having a volatile matter possibly greater in amount but more largely inert.

The Cellulosic Bodies Give Off the Incombustible Gas

An organic substance, of the cellulose nature, produces water and carbon dioxide and also monoxide, on decomposition by heat. When cellulose itself decomposes at temperatures below 500 deg. C. (932 deg. F.), 43 per cent. of its weight appears in the volatilized products as water and carbon dioxide. So also coal produces these products by decomposition, and the more abundantly the less matured and metamorphosed is the coal. We must expect to find an aqueous liquor distilled from coal during its decomposition, and in fact at gas works and coke ovens such is the case, a much greater volume of aqueous ammonia liquor being obtained, especially in the hydraulic mains (the first condensing point), then corresponds to the volume of the wash water added.

These facts enable us to draw inferences, at least, as to the chemical character of some of the substances in coal. The younger coals, like the lignites and sub-bituminous fuels, must contain large proportions of bodies with —OH and —CHO groupings, like the celluloses, since they produce water and carbon dioxide so readily; in the more mature coals, like the coking and high-grade steaming coals, there are not as many of these oxygen-bearing groups, but, probably, more of certain highly complex long-chain or many-ringed bodies having side groups of readily separable hydrogen atoms or of alkyls corresponding to the paraffin and possibly the aromatic hydrocarbons. These hydrocarbon groups are set free by heat, and then easily undergo further decomposition into the simple, commonly known products like methane and hydrogen.

The Hydrogen Probably Comes from Breaking down of Bodies Liberated at Low Temperatures

The theory of Wheeler, of the British Coal-Dust Experiment Station and others that coal contains considerable quantities of certain substances which decompose only above 700 deg. C., or 1292 deg. F., and thus yield principally hydrogen and the oxides of carbon, is hardly justified by the experimental data at hand. More reasonably is it to be supposed that the large amount of hydrogen which is produced above 700 deg. C., or 1292 deg. F., comes from the secondary breaking down of the hydrocarbons first liberated, and of the partially carbonized solid material left behind, these things not having been present, either of them, as such in the original coal. It is likely that all the organic substance in the fuel decomposes early by heat, below 500 deg. C. or 932 deg. F.

Why Coals Coke Is Not Yet Solved

The nature of the substances liberated or volatilized from coal by moderate heat throws some light on the coking properties of the coal. If by prolonged heating at 400 deg. C., or 752 deg. F., the coal shows little or no tendency to soften or sinter together, and liberates water and gas but only a small quantity of heavy, viscid tar or pitch, it does not have good coking properties.

Laboratory tests to show the coking quality of coals have never been satisfactory. Several are used which give more or less indication but are not definite. Among these may be mentioned (1) heating to a red heat a small sample inclosed in a covered, well filled platinum box, and examining the coke bar produced; (2) rubbing or grinding the coal in a mortar and noting the tendency to cake or adhere to the pestle and mortar; (3) analyzing for C, H and O and comparing ratios of O to H.

In recent laboratory experiments in Germany, cellulose has been converted into coal by subjecting it to very great pressure with moderate heating. Certain studies are now in progress to determine methods of increasing yields of some of the byproducts of coal carbonization, for example, the commercially desirable benzol and light oils, through carbonization at low temperatures and subsequent treatment, under carefully controlled conditions, of the tars thus produced.

Some Coals Volatilize Promptly when Heated but Their Volatile Output Later Falls Off

In the utilization of coal, particularly in burning on furnace grates, the rate at which the volatile matter is set free is frequently of greater importance than the total quantity produced. Coals vary greatly in this respect. The following results obtained in the laboratory on three different coals similarly treated (0.4 gram powdered, air-dry coal heated at 1000 deg. C., or 1832 deg. F), bring out this variation:

PERCENTAGES OF VOLATILE MATTER EXPELLED IN DIFFERENT PERIODS OF TIME

	5 Sec.		80 Sec.	
	Total	Combustible	Total	Combustible
New River, W. Va.	5.8	4.8	20.0	17.5
Pittsburgh, Penn.	9.0	7.5	34.0	28.1
Sheridan, Wyo.	36.0	12.4	49.0	21.6

It may be seen from these data that while the Pittsburgh coal finally produces more combustible volatile matter than that from Wyoming, the latter liberates considerably more in the first few seconds of heating.

The rate at which a given coal liberates volatile matter depends, first, on its chemical character, that is, its ease of decomposition, and, second, on the rate at which heat is supplied to it. The ratio between the quantity of coal heated and the quantity of heat supplied in unit time determines the rate at which any given coal becomes heated. It is, therefore, not a question of temperature as much as of quantity of heat and quantity of coal. When each particle of coal has attained a temperature of 900 deg. C., or 1652 deg. F., its decomposition into coke and volatile matter is practically complete.

The Variants in the Volatilization of Coal

Three points stand out as of importance in connection with the volatile matter, the constituent of coal which is so vital in all processes of coal utilization:

1. The composition as well as the quantity of volatile matter varies greatly between coals.
2. The first products volatilized in the early stages of a coal's rise in temperature are essentially different from the total product as usually obtained. These first primary products are largely tarry liquids, with some water vapor and heavy complex gases. Heating conditions determine the degree of secondary thermal decomposition of these products and the composition of the final gas and tar.
3. The rate of evolution of the volatile matter from coal is of practical importance and varies considerably with the kind of fuel. For a given coal it is dependent upon the relation between the quantity of coal heated and the quantity of heat supplied, not the temperature.

Oxidation and Ignition

Next to thermal decomposition or the evolution of volatile matter, perhaps the most fundamental process involved in the practical utilization of coal is that of oxidation or burning of the substance as a whole.

Slow oxidation at ordinary temperatures gives rise to spontaneous combustion and deterioration in storage; rapid oxidation has much to do with the initiation and propagation of coal-dust explosions in mines, and with the relative ease of ignition of fuels in general. The process of igniting a combustible substance is not as simple as it may seem on first thought, and just why some fuels ignite more easily than others requires careful analysis.

The Chip of Wood Burns before Its Gases Are Inflamed

At temperatures above that of the first appreciable decomposition of the substance (say 250 to 300 deg. C., or 482 to 572 deg. F. in case of coal), the process of combustion is complicated by the distillation of combustible gases and vapors and the alteration of the solid material. The gases and vapors of decomposition are not, however, all combustible and in fact those produced from the most readily ignited materials such as wood are largely noncombustible.

A splinter of wood held in a flame quickly ignites, it is true, because the gases of decomposition are quickly heated to their ignition temperatures. But we can also ignite the wood easily in a glass tube at 250 deg. C., or 482 deg. F., by passing a current of oxygen over it. Here the ignition cannot be a matter of distilled gases since the temperature used is much below their points of ignition.

Relative ease of ignition is unquestionably dependent to some extent on ease of oxidation; that is, the rapidity of the reaction of the substance with oxygen. Recent laboratory studies have shown that the wide variation among different coals and other combustible substances in their rate of oxidation follows the known variation in case of ignition, in susceptibility to spontaneous combustion, and in rate of deterioration in storage.

OXYGEN DOES NOT BURN THE CARBON OR HYDROGEN AT LOW TEMPERATURES BUT IS OCCLUDED

The action of oxygen on coal at ordinary temperatures has been shown by recent investigation to consist not in a burning of the carbon to carbon dioxide nor probably of a burning of the hydrogen to water, but largely of an addition of oxygen to the coal substance. This action develops heat. English investigators have shown that the calorific effect of this oxidizing action at 40 deg. C., or 104 deg. F., amounts to between 2 and 3 calories per cubic centimeter of oxygen consumed, only a little less than that produced per cubic centimeter of oxygen when coal is completely burned in which case 3 to 3.5 calories are developed.

The rate of oxidation increases rapidly with rise of temperature. A coal which at 30 deg. C., or 86 deg. F., consumes say 10 c.c. of oxygen per 100 grams in an hour, will multiply this rate so rapidly from the effect of its own production of heat, that the temperature would rise to 180 deg. C., or 356 deg. F., in a little over two days if no heat were lost. This would result speedily in ignition if an adequate oxygen supply were at hand.

DANGERS IN STORING RUN OF MINE

Spontaneous combustion in stored coal results from this slow oxidation by the air at ordinary temperatures. It is not, in any important degree, a matter of bacterial action, or fermentation. When conditions as to the size of coal and manner of piling are such that the rate of heat production by oxidation is greater than the rate of heat loss by convection currents and radiation, the temperature rises.

One of the most important practical considerations is whether an adequate air supply can penetrate to an inner section of the pile where the heat loss is slow. Fine slack coal does not heat seriously in the interior of a pile, if no lump is present. If, however, the material within consists largely of fine coal and the outer and lower sections of lump with little slack, one of the worst possible conditions is found, and spontaneous fires commonly result from such concurrent conditions.

Deterioration of coal in storage is due to slow oxidation, not to loss of volatile matter. The reduction in heating value is not as great as has commonly been supposed. With high-grade bituminous and semibituminous coals, careful determination has recently shown that this loss amounts to less than 1 per cent. in one year's exposure to the weather, and less than 3 per cent. in 5 years. With our Middle-Western and Western coals or lignites the loss is greater but probably does not exceed 4 or 5 per cent. in one year in any case. Deterioration in size or physical character may be somewhat more serious, and spontaneous heating even though moderate in degree causes an important loss. Deterioration of any kind may be quite largely prevented by storage under water.

⁂

The Manchurian Railway Company operates five coal mines which give employment to 7000 Chinese laborers who work for 25c. per day. The output is about 3000 tons for each mine per 24 hours. Though the coal is bituminous, a combination of anthracite and metal methods of mining is used, for the seam is too thick, 125 ft., to make bituminous methods practical.

Coke-Oven Accidents during 1913

By ALBERT H. FAY

The hazard of the coke industry compares favorably with the quarry industry and the surface workings of metal mines, as shown by figures collected by the Bureau of Mines for the year 1913. The investigation conducted by the bureau includes the reports of 294 establishments, 67 of which were reported as idle, leaving 227 plants as operating, and for which accident reports were received.

These plants employed 24,345 men and of this number 46 were killed, 342 seriously injured, and 2172 slightly injured. The number killed and injured per thousand employed at coke ovens in 1913 was 1.89.

The number of coke establishments is practically 575, with slightly over 100,000 ovens. The Bureau's report embraces practically one-half of the operators, and 80 per cent. of the ovens, the number reported to the bureau as active being 67,526, and in addition 12,450 ovens were reported idle. While the accident figures thus collected are not complete for the entire industry, yet they are thoroughly representative. No distinction has been made concerning the type of ovens in use.

SERIOUS AND SLIGHT INJURIES

The distinction adopted between a serious and slight injury is in accordance with that used by the bureau in the collection of mine- and quarry-accident statistics. Hence, a serious accident is considered in this report as one that would disable a man and keep him from duty 20 days or more. This class includes such injuries as broken arms and legs, loss of eye, and severe cuts and bruises.

A slight injury is considered as one that involves a loss of more than one day and less than 20 days. Under this class may be placed such injuries as cuts, sprains, mashed fingers, bruises, dirt in eye, slight burns, effect of powder smoke, etc. Of course, any slight injury may become infected and thus result in a serious accident, as defined above.

CAUSES OF ACCIDENTS

It is stated that 13 fatalities resulted from accidents caused by cars, larries and motors, and 7 fatalities were caused by railway cars and locomotives, making a total of 20 deaths due to haulage or transportation systems, representing 43 per cent. of all the fatalities. Six fatalities were due to coke-drawing machines, representing 13 per cent. of the total, and 11 per cent. to electricity.

Of the serious injuries 26 per cent. were due to haulage systems; 23 per cent. to falls of persons. Of the slight injuries, 8 per cent. were due to haulage systems; 12 per cent. to falls of persons; 14 per cent. to hand tools and 16 per cent. to burns.

Since 43 per cent. of the fatalities at coke ovens are due to haulage systems, greater care and precaution should be taken to safeguard the employees who operate or work adjacent to transportation equipment. Inasmuch as electric haulage is used extensively, a large percentage of the electrical accidents may also be classified with those resulting from haulage systems, or a total of approximately 50 per cent. of all fatalities. It is in this department of the coking industry that there appears to be an excellent field for accident reduction.

Triangulating from Two Plumb Wires

Albert G. Wolf, mining engineer of Buckhorn, Nev., shows in the *Engineering and Mining Journal* the degree of accuracy attainable in triangulation from two plumb wires. Two methods are used in shaft plumbing. In one the transit is set up directly in line with both wires; in the other it is set to one side of them, the distance from the transit to each wire and the horizontal angle are measured and the triangle is calculated. In the first method the number of measurements is less than in the second and calculations are eliminated, but as a rule it takes longer to make the set-up. It is not the purpose of this discussion, however, to argue the respective merits of the two methods, but to point out the conditions under which the triangulation method can be used, when necessary or desired, with the least liability to error.

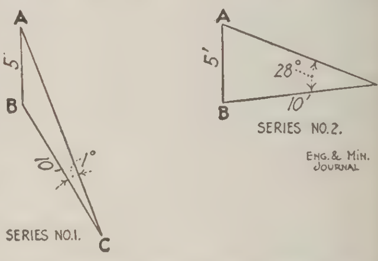
It is evident that a triangle with a small angle at the instrument, this angle small by reason of the instrument's being nearly in line with the two wires, not, however, at a great distance from them, will give the best results; for if the instrument is in line with the two wires an error in chaining will make no difference in the bearing and no horizontal angle is involved. To show exactly the relative importance of the errors to be avoided, two series of triangles of three each have been assumed and errors in azimuth calculated for assumed errors in measurement of the various parts of the triangles.

In the first series the following assumptions have been made: Distance between wires, 5 ft.; short leg of triangle, successively, 10 ft., 25 ft. and 50 ft.; angle at instrument, 1°. In the second series: Distance between wires, 5 ft.; short leg of triangle, 10 ft., 25 ft. and 50 ft.; angles at instrument, 28°, 11° and 5°, respectively. The calculations for 11° and 5° are not given in the table but those for 1° and 28° are elaborated in full.

The vertex angles of isosceles triangles with 5-ft. bases and sides 10, 25 and 50 ft. would be 28° 57′ 18″, 11° 28′ 42″ and 5° 43′ 54″, respectively, so it can be seen that the angles assumed in the second series approach nearly the maximum for triangles with the base and short side assumed. Errors of measurement assumed in each side are 0.02 ft. and in the angle at the instrument, 30″. The result in error in azimuth is calculated for each assumed error in measurement separately and the results are tabulated.

Set Up Near the Plumb Wire and as Nearly in Line as Possible

An inspection of the table shows that a small error in measuring either leg of a triangle in the first series makes an immaterial difference in azimuth, while in the second series an equal error in measuring makes an appreciable difference from the true azimuth. An error in measuring the angle at the instrument or the distance between wires, in either series, makes a large error in azimuth, but the error in a triangle of the first series is smaller than the error in a corresponding triangle of the second series. Now, referring to the first series of triangles only, it can be seen that the distance from the instrument to the wires makes no appreciable difference in the error in azimuth when an error in measuring to the wires is made, but an error in azimuth caused by an error in measuring either the distance between the wires or the angle at the transit increases rapidly as the distance from the instrument to the wires increases. In any set-up, therefore, the most serious errors to be avoided are those involved in measuring the distance between the plumb wires and the horizontal angle at the instrument. A check on the accuracy of the former is obtained by measuring between wires at the collar of the shaft, or point of suspension, and at the level of the set-up. The error in measuring the angle is reduced to a minimum by repeating the measurement and taking the average. An error in taping either of the legs of any triangle as large as the error assumed is not liable to be made if the work is checked and care is taken to hold the tape level.



Diagrams of Two Methods of Setting Up

In conclusion, the set-up least liable to result in an error in azimuth in triangulating from two plumb wires is one near the wires and in such a position that the horizontal angle measured at the transit is small.

ERRORS IN AZIMUTH, RESULTING FROM ERRORS IN MEASUREMENTS IN TRIANGULATION PLUMBING

Coming Annual Meeting of A. I. M. E.

The annual meeting of the American Institute of Mining Engineers will be held in New York, Feb. 15 to 17, inclusive. The annual dinner has been arranged for the evening of Feb. 16. The price of the dinner will be $5 per plate. The attendance of ladies is especially urged. During the convention there will be several meetings of the alumni of various colleges.

On the program are a number of papers that will interest coal-mining people. On Monday morning, Feb. 15, Frank H. Kneeland, associate editor of Coal Age, will present a paper, entitled "Safeguarding the Use of Mining Machinery." Following this, Howard N. Eavenson, mechanical engineer of the U. S. Coal & Coke Co., at Gary, W. Va., will read a paper on "Safety Methods and Organization of the U. S. Coal & Coke Co." On Tuesday, commencing at 2 p.m., there will be a Technical Session on Fuels. The following papers will be presented: "The Limits of Mining under Heavy Wash," by Douglas Bunting, chief engineer of the Lehigh & Wilkes-Barre Coal Co., Wilkes-Barre, Penn.; "Recent Developments in Coal Briquetting," by Chas. T. Malcolmson, briquetting expert, Old Colony Bldg., Chicago, Ill.

The meeting of the committee on coal and coke will be held at 4 p.m., Tuesday afternoon.

At 2 o'clock on Wednesday afternoon, there will be a Technical Session on Electricity in Mines. One of the papers will deal with underground haulage by storage-battery locomotives.

⁂

Lackawanna Banquet

A banquet was given Jan. 6 by H. G. Davis, district superintendent of District No. 4 of the Delaware, Lackawanna & Western R.R. Co. Coal-Mining Department, the guests being principally the inside and outside foremen of the collieries under his charge, which are Woodward, Pettebone, Avondale, Auchincloss, Bliss, Truesdale, Loomis and Shafts 3 and 4 of the Pettebone colliery around Wilkes-Barre, Penn.

This social gathering which took place at the Hotel Redington, is an annual event, but this year the foremen had decided to make it notable by the presentation of a large leather-covered morris chair to W. B. Owen of Dorrancetown, who, after 56 years of hard toil, has resigned his position with the company. He started work with the corporation as a breaker boy and since that time has been steadily promoted.

C. E. Tobey, general superintendent of the company, acted as toastmaster and among the invited guests were B. Samson, superintendent of construction, D. R. Reese, attorney of the coal-mining department; W. B. Thornton, superintendent of coal preparation; P. H. Devers and R. P. Thomas, assistant deputy superintendents; Dr. D. H. Lake, company physician, and S. J. Jennings and D. T. Davis, mine inspectors.

The speakers at the banquet were D. R. Reese, who spoke on mine accidents, declaring they were not unavoidable; P. H. Devers, whose address was on vocational schools and the Nanticoke Mining Institute; D. T. Davis and S. J. Jennings, who emphasized the need for further safety, the latter denouncing the fatalistic notion that "accidents will happen" no matter what is done to avoid them; Dr. D. H. Lake, who spoke on the value of first aid.

⁂

The Anthracite Rate Case to Philadelphia

Five railroad companies have taken an appeal to the Court of Common Pleas of Dauphin County from the decision of the Public Service Commission of Pennsylvania in connection with the reduction ordered in the anthracite rates to Philadelphia on the following grounds:

(1) The decision in question orders not only a reduction in the rates on anthracite coal used for domestic purposes, but also a reduction in the rates on sizes of coal not so used, which rates were not embraced in the complaints filed with the Commission and the traffic moved under which is approximately 50% of the total anthracite coal tonnage to Philadelphia.

(2) The applications to the freight rates on all other commodities of the principle applied by the Commission in determining the Philadelphia rate on anthracite coal would produce commercial chaos and reduce the net revenues of the carriers by an amount far greater than the gain under the decision of the Interstate Commerce Commission in the Five Per Cent. Rate Case and the recent adjustment in the passenger rates.

(3) The reductions in the rates ordered will force the reduction of a large number of other anthracite rates, both state and interstate, to points other than Philadelphia.

(4) The effect of the reduction will be to diminish the net revenues of the Pennsylvania Railroad Co. by approximately $1,500,000 a year, the net revenue of the Philadelphia & Reading Railway Co. by approximately $2,000,000, and of the other companies by several hundred thousand dollars per annum.

The importance to the state of Pennsylvania and to the city of Philadelphia of adequately conserving the revenues of the carriers demands that immediate action shall be taken to protect their revenues from such widespread destruction as is involved under this order of the Public Service Commission.

The railroads which will enter appeal are: The Philadelphia & Reading Ry. Co., Pennsylvania R.R. Co., Lehigh Valley R.R. Co., Central R.R. of New Jersey and the Delaware, Lackawanna & Western. The companies will file separate appeals and also a joint appeal.—"Philadelphia News Bureau."

⁂

Safety-First Developments in the Northwest

The Anaconda Copper Mining Co. of Montana has fallen into line with a number of the larger progressive Eastern coal companies in the matter of an official monthly publication, issued under the auspices of the company officials. The initial number appeared Jan. 1 and carries the appropriate title *The Anode*. It contains an interesting sketch of the safety-first developments at the company's coal operations by General Manager F. W. C. Whyte, of the coal department, which is interesting in that it typifies the current status of this movement in that section. We present the sketch in full herewith:

Up till the present time "Safety First" at the coal mines of the company has been confined to the customary rules governing such work, and to extra precautions we have learned from past experiences in the line of unlooked for accidents.

Ten years or more ago, in the mines at Diamondville, we had a fire that cost several lives, and a few years later a fatal explosion in the same mine. From these two experiences we learned several valuable lessons and have since been taking precautions at all the coal mines that are not usually practiced. For several years past our mines have been comparatively free from accidents, averaging somewhat below the neighboring operations, and it is my opinion that after the safety first committee has the time to attend to our needs and prescribe for our conditions we will effect a still further reduction in our accident rate.

So far we have only made the preliminary start in the way of cleaning up around and in the mines with a view to eliminating accidents due to interference in a man's working zone, and are now ready to organize with committees, etc., to carry the good work along. When this has been done there is no doubt in my mind that the Anaconda Co.'s mines at Diamondville, Washoe and Sand Coulee will compare more than favorably with any of the coal mines in the West.

⁂

When wire is purchased for the purpose of stringing on poles for electric transmission, the general impression is that it is easier to handle if placed on reels than if in coils, but if this question were given a little thought, persons having such an idea would soon be convinced otherwise. They should take into consideration the transportation of wire in coils as against that on reels, the increased amount of coiled wire that can be stored in a given space as compared with the same amount placed on reels, the increased cost of freight due to reels, and the necessity of keeping the reels in good condition after being emptied and the amount of handling incurred because of the empty reels, the return transportation charges and the necessary clerical work and supervision required. With coils, all labor and responsibility cease after the wire is strung.

The Labor Situation

SYNOPSIS—Ettor is arrested for treason in eastern Ohio when he endeavors to start I. W. W. violence. Strike-breakers are said to be ready for transportation to the mines on strike. Testimony of J. D. Rockefeller, Jr., in New York City.

The principal event in the strike situation of eastern Ohio, during the past week, was the appearance and arrest of Joseph J. Ettor, the noted Industrial Worker of the World. Ettor was billed to speak at Bellaire, the handbills announcing a meeting of the "revolutionists." When Ettor stepped off the train the sheriff and a few deputies armed with a warrant for his arrest on the charge of treason appeared and took him in charge. He was hurried to the county jail at St. Clairsville. Later a demonstration on the part of some of his sympathizers was made, but the authorities held them in check.

Apparently the charge of treason was based on the wording of the notices announcing Ettor's proposed address. The meeting was declared on these placards to be "under the auspices of a group of revolutionists." Ettor's subject was to be "Against War: for the Class War: Against all Capitalists of the World."

Ettor was arraigned on the charge the following day, and, upon his signing a bond in the sum of $5000, agreeing to leave the county on the first train and also to refrain from sending Industrial Workers of the World organizers and agitators into that section, he was released.

Efforts Being Made to Reopen Mines without Union Control

Reports from the eastern Ohio district show that about 150 men are now employed by the Roby-Somers Coal Co. and other mine owners are arranging to start work. Quite a few of the operators are waiting for the result of the investigation by the federal Department of Labor which is still in progress.

The Roby-Somers Coal Co. is having difficulty in its evictions. Some of the summons were illegally drawn and new papers will have to be prepared. In all eviction suits the miners have first appeared at a hearing before a justice and demanded a jury trial. They have then appealed from the decision of the jury to the court of common pleas. No cases thus far advanced have as yet been decided but it is supposed that appeals will be taken from the court's decision in order that the tenants may not be dispossessed from their houses till the spring when the temperature will be better suited for dwelling in tents.

A meeting of the federal investigators with eastern Ohio operators and John P. White, president of the United Mine Workers of America, was held in Cleveland on Jan. 23.

Bringing in Strike-Breakers

A report came from the strike zone to the effect that arrangements had been completed for the importation of 6000 miners to take the places of the strikers. This colonizing is being done by the operators' association and not by the individual operators. The plan is believed to be preferable because under it individual operators will not assume any responsibility.

The men operating the fans and running the pumps at Mines Nos. 1 and 2, of the Rail & River Coal Co., have been called out. Nonunion men may be put to work and disorder may result. Now that there is talk of a resumption without any agreement being made with the miners, the union is not disposed to let union men keep the mines in condition for working.

Comparison of Eastern Ohio with Fairmont District

W. L. Moke, general manager of the Roby Coal Co., has interests in the Fairmont district of West Virginia. He is quoted as saying:

> In this particular nonunion district (Fairmont) the miners receive 38c. for loading a three-ton pit wagon and 40c. for loading a three-ton pit car in narrow work; hence 2c. per car for run-of-mine coal is the compensation they receive for driving narrow work, etc. They receive $1.60 to $1.75 for inside and outside day labor, 10 hr. per day, compared with $2.19 for outside day labor and $2.84 for inside day labor, 8 hr. per day, in eastern Ohio. Further than this the freight rate from eastern Ohio to the Lakes is 85c., while from Fairmont the rate is $1 with a difference of from 50 to 60 miles of haul. The miners of eastern Ohio are demanding 47c. a ton for machine coal though the operators have to meet this nonunion competition."

The miners recognize the importance of these railroad conditions as bearing on their attempts to secure the rate they demand. At the annual state convention of the United Mine Workers of America, held Jan. 12, the following resolution was adopted:

Freight-Rate Resolution

> **Whereas,** the mining and marketing of coal are dependent upon transportation from mines to markets, and it is claimed that coal mined in West Virginia and Kentucky is hauled greater distances by the railroads than Ohio coal, at the same price, and that Ohio railroads are hauling West Virginia and Kentucky coal in Ohio at lower freight rates than they are charging for hauling Ohio coal; and
>
> **Whereas,** the Ohio coal-mining industry and the miners and their families and all other dependent upon that industry are suffering, and it is charged that high freight rates and discriminations against coal mined in Ohio are largely responsible;
>
> **Therefore, Be It Resolved,** that we respectfully petition the General Assembly of Ohio to investigate the subject at this session and give to the miners, producers and consumers of Ohio coal the benefit of the same relative freight rates over the railroads in this state that the same railroads are now giving to the miners, producers and consumers of West Virginia and Kentucky coal; and
>
> **Resolved,** further, that in behalf of the miners, producers and consumers of Ohio coal and others dependent upon the industry, the Industrial Commission, the Public Utilities Commission and the attorney-general be and they are hereby respectfully petitioned to investigate and report to the General Assembly at its present session whether shipments of coal from Ohio mines are discouraged and in many cases reduced or prevented by discriminations practiced by Ohio railroads against shippers of coal mined in Ohio;

Arkansas Trouble Ending

Unexpectedly on Wednesday morning, Jan. 20, seven persons out of 20 arrested on charges found by a special grand jury last November in the investigation of the outbreaks of violence in the Prairie Creek mining district, pleaded guilty. W. C. Fitts, of Birmingham, Ala., the prosecutor for the government, entered a nolle prosequi for the other 13 defendants.

Peter R. Stewart, of McAlester, Okla., former president of the United Mine Workers of America in Arkansas, Oklahoma and Texas, was fined $1000. Fred W. Holt, of the same place, former secretary of the same district, was fined $1000 and was sentenced to six months in jail. James B. McNamara, a former councilman of Hartford, Okla., received the maximum sentence of $1000 fine and two years at hard labor at the federal penitentiary, Leavenworth, Kan. James Slankard, formerly constable of Hartford, is to pay $1000 fine and serve six months in prison, and Clint Burris, Sandy Robinson and John Manick pay $500 each and spend six months in jail.

It was announced by the prosecutor that John Champion, Dave Branch, Oscar Layton and William Reed, who were indicted on the charge of taking prisoners from Deputy U. S. Marshal Tom Black, at Hartford, shortly before the cavalry was ordered to Prairie Creek, would surrender themselves for trial.

James Slankard and Bee Trout, who were indicted for the murder of John Baskins and Clarence Syllesberry, were acquitted on Jan. 15, as testimony was brought to show that the alleged bones of the victims of the striking miners were from the carcass of some lower animal.

Whether any further action will be taken is uncertain. There will be no further attempt to redress the federal wrongs, except as regards the four men who took prisoners from the U. S. marshal, but the state may well take action to punish those who were guilty of arson and perhaps murder.

It is said that the United Mine Workers of America has deposited $50,000 to the order of the Bache-Denman Coal Co. as first payment for the mines of that corporation. The price at which the property is to be sold to the U. M. of A. is $200,000.

On Jan. 25 the executive board of the seventeenth district of the U. M. W. of A. met at Charleston, W. Va., to launch a movement to organize the miners in the Guyan Valley district.

Poor John D. Rockefeller, Jr.

On Jan. 25, 26 and 27, J. D. Rockefeller, Jr., testified before the Federal Relations Commission, and, according to the New York "American," he was severely heckled about conditions at Delagua by Chairman Walsh. He took the criticism with great serenity and did not appear to know any more than his pertinacious questioner that the Colorado Fuel & Iron Co., in which his father is interested, has no mines at Delagua, which is a Victor-American Fuel Co. camp. In fact Walsh is as much an absentee investigator as Rockefeller is an absentee owner. The whole business resolves itself into a complete farce. The people of Colorado are being victimized by agitators from outside, muck-raked by investigators who refuse to make definite inquiries, called upon to assent to conditions imposed by President Wilson, who has never been on the ground, and generally are suffering from long-distance treatment with all it entails.

Because Mr. Rockefeller did not deny several charges, it is declared he practically admitted them. If not denying is admitting, the Victor-American Fuel Co. may look well to its title in Delagua since John D. Rockefeller, Jr., did not deny that his father owned the plant. In fact, all the Colorado people may as well surrender claims to their property; the public refuses to believe that there is any other company than the Colorado Fuel & Iron Co. doing business in the state and that there is any other stock besides that which the Rockefeller interest owns, though John D. Rockefeller, Jr., has repeatedly called attention to the falsity of this opinion.

Mr. Rockefeller testified that $92,000,000 had been paid in wages since the stock had been purchased by his father, that the whole revenue derived by the Rockefeller stock was only $371,000. As that stock amounted to $6,000,000, the earnings were about two-thirds of one per cent. per annum. The estate also holds bonds but the investment both on stock and bonds has not amounted to 3½ per cent. per annum.

J. D. Rockefeller, Jr., Outlines His Attitude

Mr. Rockefeller made some remarks of much interest, among others the following:

As to the strike itself, its many distressing features have given me the deepest concern. I frankly confess that I felt there was something fundamentally wrong in a condition of affairs which rendered possible the loss of human lives, engendered hatred and bitterness and brought suffering and privation upon hundreds of human beings.

Without seeking to apportion blame, I determined that in so far as lay within my power I would seek means of avoiding the possibility of similar conflicts arising elsewhere or in the same industry in the future. It was in this way that I came to recommend to my colleagues in the Rockefeller Foundation the instituting of a series of studies into the fundamental problems arising out of industrial relations, which resulted in securing the services of Mackenzie King, former minister of labor of Canada, to direct the studies.

The correspondence will show that, in addition to having taken steps as early as the beginning of June last to secure Mr. King's services, I also sought and obtained advice with respect to machinery for the prevention and adjustment of industrial differences, to which I invited the consideration of the officers of the Colorado Fuel & Iron Co.

In early August I wrote the president of the company, forwarding, with my indorsement, a letter from Mr. King, written in answer to my request, outlining a plan previously discussed, to establish:

"A board on which both employers and employed are represented, and before which, at stated intervals, questions affecting conditions of employment can be discussed and grievances examined."

In reply to this communication, the president of the company indicated that measures of the kind I had suggested were in contemplation, but that their adoption while the strike was on would only serve to embarrass their successful introduction. He further indicated that, when the strike was terminated, steps would be taken immediately to secure to the employees of the company a more direct representation of their views as regards grievances and conditions affecting their employment.

The Miners to Be Represented

The strike was called off Dec. 10, 1914. On Dec. 16, David Griffiths, formerly state coal mine inspector of Colorado, was appointed an intermediary between the company and its employees, respecting matters of mutual interest.

On Jan. 5 a notice was posted at all the company's mines inviting the employees at each of the mines to assemble in mass meeting to select by ballot one representative to every 250 employees in each camp, to represent the men at a joint meeting of themselves and the executive officers of the company in Denver, "for the purpose of discussing matters of mutual concern and of considering means of more effective coöperation in maintaining fair and friendly relations."

In the published notice of these meetings it was stipulated that in order that the men might feel the greatest freedom in making their selection, they should choose their own chairman and neither superintendents nor pit bosses should attend.

Joint Conference Is a Success

I have received from the president of the company, a telegram informing me that this joint conference was held at Denver on the 19th instant, that the meeting had proved most satisfactory to all concerned and that its spirit had convinced the management that it would lead to more active coöperation between the company and its employees in the future.

I believe that the ultimate object of all activities in a republic should be the development of the manhood of its citizens; that such manhood can be developed to the fullest degree only under conditions of freedom for the individual, and that industrial enterprises can and should be conducted in accordance with these principles.

Capital Can Wait for Earnings

I believe that a prime consideration in the carrying on of industry should be the well-being of the men and women engaged in it, and that the soundest industrial policy is that which has constantly in mind the welfare of the employees as well as the making of profits, which, when the necessity arises, subordinates profits to welfare.

In order to live, the wage earner must sell his labor from day to day. Unless he can do this the earnings from that day's labor are gone forever. Capital can defer its return temporarily in the expectation of future profits, but labor cannot.

Interests of Employees in Mine

If, therefore, fair wages and reasonable living conditions cannot otherwise be provided, dividends must be deferred or the industry abandoned.

I believe that a corporation should be deemed to consist of its stockholders, directors, officers and employees; that the real interests of all are one and that neither labor nor capital can permanently prosper unless the just rights of both are conserved.

If, with the responsibilities I have and the opportunities given me, I am able to contribute toward promoting the well-being of my fellow men through the lessening of injustice and the alleviation of human sufferings, I shall feel that it has been possible to realize the highest purpose of my life.

A Company Hotel

Hotels built and owned by coal companies are quite numerous. In fact, every new mining village has its boarding house or hotel, and, like the miners' dwellings, these are built by the company. The Carbon Coal & Clay Co., of Bayne, Wash., however, runs as well as owns its own hotel, serving excellent meals at 30c. apiece. The cost per meal in November of last year was $0.196, the help adding $0.101, making a total cost $0.297. So the company made a profit of $0.003 per meal. The intention is to run the hotel without either loss or profit. The rooms are neat, clean and comfortable. The mines are run on the "open-shop" basis.

A HOTEL WHERE MEALS AND ROOMS ARE PROVIDED BY COMPANY AT COST, BAYNE, WASH.

SCHOOLHOUSE AT THE VILLAGE OF BAYNE, WASH.

The store manager runs both hotel and store. For the hotel he lays aside a monthly rent of $200, which pays a good interest on the investment. Several hundred dollars have been spent in general village improvement and, as will be seen, the town has a creditable school for so small a community. This also was built by the company.

An Analysis of the Anthracite Shipments in 1914

SYNOPSIS—The accompanying comments and tables of shipments, stocks, allotments, etc., were compiled by the "Philadelphia News Bureau" and form a valuable reference on anthracite statistics.

The shipments of anthracite coal in 1914 as reported by A. H. Armstrong, chief of the Bureau of Anthracite Statistics, were 68,342,601 tons, a decrease of 727,027 tons as compared with 1913, in which year shipments were 63,610,578 tons. The tonnage in 1914 was satisfactory in volume and the price of coal was fairly well maintained, though it was apparent during the greater part of the year that the output was larger than the market requirements.

Probably the most important feature of the year was the aggressive movement of some of the carrying companies for tonnage. The figures show that the Reading, which has been the leading company in the ownership of coal lands and in the distribution of coal, again falls behind the Lehigh Valley. The Reading makes comparatively light shipments while the Lehigh Valley makes record shipments. For the year the Reading shows a decline of 916,000 tons as compared with 1913 and Lehigh Valley an increase of 125,000 tons. The C. R.R. of N. J. also fell behind, indicating that the conservative policy of the late George F. Baer is still in force. The absence of any agreement as to production or distribution of coal allows full liberty to each of the companies. There has been much comment in the trade on the subject. It is feared that the tonnage enthusiasm may result in trouble if it continues. The Lehigh & New England, the new anthracite shipper, shipped 1,317,000 tons in the first eleven months and will be on the official list of coal transporters this year.

Walter H. Clingerman

Walter Hicks Clingerman has been elected president of the H. C. Frick Coke Co., to succeed Thomas Lynch, who died Dec. 29, 1914. Mr. Clingerman has acted as general superintendent of the Frick company for a number of years.

His early education was obtained in the public schools of Altoona, Penn., where his boyhood days were spent. In 1885 on leaving school he secured his first position as an apprentice in the machine shops of the Pennsylvania R.R. Co. at Altoona.

Four years later, Mr. Clingerman was transferred to the office of the superintendent of motive power in charge of all the drafting work on new construction jobs. In 1895 the Pennsylvania R.R. Co. gave him a leave of absence to superintend the construction of car shops for the H. C. Frick Coke Co. and put car repairs on a piecework basis. This work consumed one year of his time, after which he returned again to the railroad company.

Walter H. Clingerman

In September, 1897, Mr. Clingerman became general foreman of the Everson carshops of the Frick company, and about a year later was appointed assistant general superintendent of all their mines. In February, 1904, six years later, he was advanced to the position of general superintendent of the H. C. Frick Coke Co., and served in that capacity until his recent appointment to succeed Mr. Lynch as president.

Mr. Clingerman is one of the most popular men in the Pennsylvania coke fields, and his advancement to the highest position in the Frick company meets with the general approval of coke men everywhere. He is the logical man for the job that was so capably filled by Thomas Lynch, and there is no doubt but that he will lend himself heartily and vigorously to the continuation of the admirable work on sociological lines so ably planned by his predecessor. The Frick company, in its relations with its employees, is a model corporation and one that might be used as a pattern by other concerns in different fields.

Walter Clingerman is 46 years of age. He is a director of the Madeira-Hill-Clark Coal Co. and of the Memorial Hospital, Mt. Pleasant, Penn. However, practically all of his time and effort in recent years have been devoted to the service of the Frick company. He is the sort of man who concentrates to the utmost on the work in hand, and we predict that the company he now heads will continue its successful course of development under his lead.

*

To Illustrate Anthracite-Mine Accidents

The coal-mining department of the Delaware, Lackawanna & Western R.R. is having prepared by the Edison Co. a series of moving-picture "plays" illustrating possible accidents in the mines, with the obvious corollary of how to avoid them. Some of the moving pictures of anthracite mining prepared by the United States Bureau of Mines may be used in conjunction with the Lackawanna films.

No effort is being spared in the Lackawanna's elaborate campaign for safety in the mines, and by stretching a wire to the miner's house these plays can be given with a small projecting machine right in his home. Where it is impossible to stretch a wire, storage batteries may be used for their home entertainments. The moral effect in promoting caution is the company's reward for the trouble and expense.

Prizes will be offered for the most vivid and instructive plays and these will be turned over to the "keg fund" of the locality which wins them. At many of the Lackawanna collieries the empty powder kegs which are returned in good condition are stored by the company, which credits 8c. to the fund for each keg, the exact amount received from the powder company for their return. These funds are devoted to paying sickness and death benefits and funeral expenses for the mine workers. They average from $1700 to $2000 a year.

New River Coal Co. Makes Big Deal

A deal of importance, which concerns a large part of the output of the New River Coal Co., of which G. H. Caperton, of Charleston, is president, with headquarters in that city, has been reported, whereby the New England Coal & Coke Co. secures an important tonnage from the mines of the New River Coal Co., which are located in the New River District of the West Virginia Smokeless fields.

The consummation of this deal means that the New River Coal Co. will sell a large block of its coal, or all the coal from its mines shipped into the New England States, to the New England Coal & Coke Co. for a period of years. This coal has heretofore been sold under contract to the Darrow-Mann Co., of Boston, who are controlled through stock ownership by the New River Coal Co.

The new tonnage that the New England Coal & Coke Co. will receive from the New River field through this contract will give it a supply of smokeless coal in the New England markets considerably in excess of 2,000,000 tons a year.

Editorials

The High Price of Coal Land

The Sibyl who tried to sell her books to Rome burned three volumes each time her offer was refused and then asked an unchanged price for those still remaining. A similar obstinacy is manifest in the sale of our coal lands.

For six years we have steadily raised the price of the coal land on the public domain. The acreage price of the lands sold has risen 132 per cent., an increase of 22 per cent. per annum, and even that inadequately represents the increases of valuation of the best coal lands. Meanwhile the sales have dropped from $636,663.18 in the fiscal year ending July 1, 1908, to $307,487.95 in the past fiscal year. Whereas in 1908 there were 303 entries, in 1914 there were 71 or barely one-fourth as many. In the first year almost five times as much coal land was sold from the public domain as in the last. So the American Sibyl has steadily raised prices as the chances of selling coal and other lands declined.

But the public, like the Sibyl, is satisfied, and the West, of course, must needs be also, as its people are clearly in a minority. A few weeks ago, an Easterner opened an address on Alaska with the words: "The people there think they own Alaska." They probably do, and the people in the West think they own the West. But they don't, as you can see by these sales and these prices.

The mother country, east of the Mississippi, still has a money interest in its colonies as the frequent use of "public domain" and "landlord" in government enactments and publications most clearly shows. We wish that at last there may come an awakening, and that the old folks of the East may learn yet to see that the young folks of the West know their own needs and rightly appraise their own difficulties. Regretful it is that old fogyism and absentee governmental management are keeping the West from its merited progress.

Retail Dealers Cannot Refuse Coal Shipments

A growing evil among Indiana retail coal yards to order coal from the mines and then after it is en route cancel the order and request the shippers to effect other disposition has caused some of the Indiana shippers to refuse to make any further shipments to consignees following this practice. Recently the R. C. Whitsett Coal & Mining Co., of Chicago, tested out a case of this kind in the courts of Fort Wayne, Ind., and won their suit.

It seems a coal dealer in Fort Wayne in the usual way ordered a car of coal from the Whitsett Coal & Mining Co., which was shipped promptly from the mines, and before it arrived at Fort Wayne the consignee refused to accept the shipment, stating that he was overstocked and could not use the coal. The Whitsett company refused to act on this request and the shipment went through to destination, as originally consigned, with the result that the consignee refused to accept the shipment upon arrival on account of quality. The suit was decided in favor of the plaintiff, that is, the Whitsett Coal & Mining Co., and judgment was given against the defendant for the full invoiced price of the coal, plus all expenses in connection with the suit.

The operators complain that Fort Wayne is an unsatisfactory city in which to sell coal because of the custom of dealers in that city to refuse shipments on one pretext or another and to ask for allowances which are uncalled for. This case shows that when a dealer orders coal from an operator he must accept it and not refuse it after it has been in transit. The law provides when coal is sold f.o.b. mines that title thereto passes to the consignee immediately upon delivery to the initial carrier for transportation, and the shipper's responsibility is ended, as the law does not make the consignor a guarantor of safe or due delivery, so that the consignee is the lawful owner of a shipment of coal so sold, after it leaves the mines.

If Coal Sold at over $32 a Ton

The Federal Industrial Relations Commission is liable to increase rather than diminish industrial discontent, and not the least of the trouble-makers are those excellent captains of industry like Henry Ford, who, lying in protected harbors, hint that there need never be a ruffled sea and that seasickness is entirely unnecessary.

But the cause of the success of Mr. Ford in industrial sociological work is revealed when he says that, in his establishment, capital of $2,000,000 manufactured $80,000,000 to $90,000,000 of product and *earned $25,000,000 of profits last year.* It is pertinent to inquire what relations these profits bear to the conditions in the coal industry.

The Census reports for 1909 show that $960,289,465 was invested in bituminous-coal mines. The product, as recorded by that Bureau, was 376,865,510 tons. Hence capital to the extent of $2.54 was needed for every ton of product sold.

Henry Ford and his associates multiplied their wealth 12½ times in the course of the year. That gain translated into the coal industry would involve a profit of 12½ times the capital invested in coal operations per ton of product or 12½ times $2.54, or $31.75. Thus every ton produced would have to pay a clear profit of $31.75. Roughly speaking, the market would have to buy coal at $32.75 in order that the coal operators might have as large an amelioration fund as Henry Ford and his associates.

Of course, objections will be made to this line of argument and we will anticipate some of them that our frankness be not impugned. The Ford factory, like the coal industry, does not always work at maximum pressure, but, of course, a large industry like coal mining, as a whole, is not speeded up like the Ford works. As a unit i is not so efficient. Moreover, whereas there is water in the form of excessive coal-land valuations in the coal industry, there is probably none in Ford's capitalization and two millions may not represent the true valu of the Ford plant. But nevertheless the figures are significant. When the automobile industry becomes overcrowded like the manufacturing of bicycles, probably Mr. Ford may find he cannot be so liberal and so feudal.

Meanwhile he exhibits well the generous instincts of American capital and his work will have an excellent effect if the public will only bear in mind that the conditions under which he operates are exceptional.

⁂

Who Gets the Promotion?

In deciding which is the best answer of the nine published last week, with reference to the cartoon problem "Who Gets the Promotion?" no provision was made for awarding the first prize of $10 in case two or more of the contestants were tied. We, therefore, wish to state that in such an event each and all of those participating in the tie will receive the full first prize of $10. As stated last week, the postal card vote closes Feb. 2, and the result will be published in our next issue, Feb. 6. If you haven't already voted, do so today; this is your last opportunity.

⁂

This Winter Marks the Finish of a Number of Middle Western Operations

It is currently reported that several of the older mines in the Indiana field may be shut down or abandoned because of inability to market their production under the prevailing highly competitive conditions. In Illinois it is more than likely that several of the present operations will not be hoisting coal at this time next season; in fact, they are only kept open now in the hope that enough winter weather may be left to warrant the shipment of coal at profitable prices. One operator in Indiana reports that scarcely 50 per cent. of the tonnage covered by contracts has been shipped so far this winter. There was a rush of orders about the holiday period, but just now the country dealer is taking practically no coal whatsoever.

⁂

Freedom of Speech

We have always been delighted with the freedom of speech prevailing in the Geological Survey. Even when it permitted George Otis Smith and George Ashley to write us scathing letters, we still felt such plainness of speech was creditable to the organization, for we object to the attitude that comment should not meet with a reply when the person or body discussed feels the criticism unmerited.

But we are still surprised at Mr. Smith's Gallic frankness of utterance. In his last report he says: "There is no indication that those who really wish to establish mines hesitate to buy at Government valuations." Yet a year ago, when five more sales were made and 1032 more acres were sold, Mr. Smith's chief, Franklin K. Lane, stated: "Our coal land is not being used under this plan (the classification of land and its vending at the price appraised) save under exceptional conditions of local and immediate demand."

We are glad there is a department where the subordinates are so free to take an opposing view to that of the official in charge. It speaks well for F. K. Lane, and convinces us that he is a man of broad views who can respect such a contrasting difference of viewpoint. Still we wish the Director of the Geological Survey used his freedom of speech to a more worthy end and could back it with better evidence.

The higher-priced land seems mostly to have been sold in 40- and 80-acre plots. Those who have experience in mining know that acreages so small are but rarely bought for operating purposes unless adjoining larger areas. Coal land is often bought for saloon and town sites, and consequently the small size of the areas sold at any one definite price is suggestive of the real purpose of the purchaser.

⁂

The Tidewater Coal Situation

The prominent feature in the Eastern coal markets this week is the sharp advance in water freights along the coast. Unfavorable weather during most of the month has shortened the supply of barges and sailing vessels that were available, and now the insistent demand for tonnage off-shore at "war rates" has made it plain to the coal trade that rates are up for the season. What the full effect will be it is too early to say, but the strenuous efforts of a week ago to close contracts on Southern coals have abated.

No prudent shipper now cares to name a delivered price without transportation in hand; the situation is too full of uncertainty. The range of freights is getting so high that buyers will probably prefer taking chances of a drop later in the season, for except in cases where plants are directly on tidewater there is still the possibility of taking Pennsylvania coal all-rail.

It is hard to see wherein vessels are likely to be in any better supply. Those closed on time charters to South America and to the Mediterranean are sure to be away for long periods, and unless a considerable tonnage of the medium-sized type comes from off the lakes most of the Pocahontas and New River agencies are likely to find it difficult to secure transportation for their coastwise trade.

⁂

That Elusive "Boom" in the Middle West

The long expected industrial revival scheduled for the first of the new year has certainly not materialized to the extent anticipated. In the Middle West for instance, there have been a great many statements in the daily press that the business situation has shown signs of marked improvement but it is not apparent to the coal man. However, there are certain movements afoot, within the coal trade there, to better its condition; these are making progress and may gain such momentum by another season as to have a decidedly favorable influence on prices and general selling conditions.

The coal operators can find their own remedies for the major portion of the evils which have existed for several years past if they will adopt coöperative methods, like those prevailing in other industries here and abroad.

⁂

A side-light on the export trade is the arrival of coal from England. Several steamers coming to Portland, Maine, for instance, to take horses and supplies for the British army have brought coal as ballast in thousand-ton lots, a fact that tends to show that England is not short of fuel and is shipping coal regularly in most directions.

Sociological Department

A Miners' Tribune

The Colorado Fuel & Iron Co. has appointed a representative to be a link between the employees and the higher officials and to take care of the interests of the former. He will travel from mine to mine, and where misunderstandings or grievances cannot be adjusted between the employees and the local management, it will be his duty to take up such matters and adjust them.

David Griffiths, the man for this important post, has large acquaintance with the employees of the company and has a known sympathy with them which peculiarly fits him for the work he has to do. With Mr. Griffiths to see that justice is done, no grievances the miners may have will fail to be redressed. In fact, he will really be J. F. Welborn's representative in the field.

⁂

Some Aids to First Aid

By Frank S. Davis*

After the prizes for the annual contest have been awarded, the entertainments are over and the brass band has gone home—the next meeting of the First-Aid Club is apt to be poorly attended. There is a sudden slump in interest, and unless the doctor and the "super," together with the mine foremen, put forth unusual efforts, it is hard to revive the waning enthusiasm, at least until the next "annual" looms imminent. Yet, if first aid is to become as large a factor as it should be; if it is to be so generally comprehended that an accident cannot occur without having someone near who understands its principles; if the victim is to have his sufferings alleviated at the earliest possible moment, interest and enthusiasm must be maintained throughout the year.

Intermittent Interest in First Aid

"Keeping everlastingly at it brings success" is an old saying and a true one. But keeping everlastingly at the same thing, in first aid, gets monotonous. It is necessary to vary the routine, to get new incentives, in order to enlist new men, and keep the interest alive and vital all the time. New schemes must be devised, and new devices tried. The team that has won the trophy three successive years is a valuable organization, and we are all proud of it, but if each member of that team were engaged in training new beginners, of how much greater value would the work of the team become?

Some methods which I have tried are proving successful, and it is with the thought that they might be suggestive to others that this article is written.

After one annual contest here, there was an immediate cessation of interest. The First-Aid Club languished, and there was nothing doing. The hall was only open on special and rare occasions, and then the meetings were slimly attended.

To remedy these conditions, a meeting of the mine foremen, who comprise the executive board of the First-Aid Club, was held. A concert was given, plenty of talent being available, and a fund of about two hundred dollars was thus created. A janitor was hired, and the first-aid hall was open, warmed and lighted, every night. Then a "smoker" was given, and a free-for-all meeting was announced. At this meeting dues were voted, 25c. a month, a secretary, treasurer and president elected, and some enthusiasm aroused. New teams were organized, and everything put in shape for a vigorous first-aid campaign.

The annual contest was held on Labor Day, with five full teams competing. Out-of-town judges were selected, and there was no unpleasant aftermath, although competition was keen, and the contest very close.

Better Safe than Sorry

In addition to the cup and cash prizes, all members o the teams were presented with the company's first-aid buttons. These are handsome little emblems, in blue and gold, with the motto, "Better Safe than Sorry," encircled by the name and location of the company. The men were told that these buttons could be procured only by taking first-aid training, and a Thanksgiving contest for beginners only, with buttons for prizes, was announced.

The contest came off in due time, and the committee i charge added some cash, raised by subscription, to increas the interest. Each team was composed of five men and captain, only the latter being a "button" man, and eve his activities were strictly limited to instructing his men Three teams competed, and all members were adjudge worthy of receiving buttons. There are now about fift "button men" in the camp, and a surprising amount o pride is taken in the tiny decoration.

Not a Cup in a Case but a Sign at the Mine

The next contest is to be a free-for-all affair. A con spicuous sign, containing the words "Champion First-Ai Team," with a reproduction of the first-aid buttons a either end, will be allotted to the winning team. This sig will be placed over the top of the manway at the min from which the team came, and must be held by that tea against all comers.

In other words, if the team from No. 1 mine wins th contest, it must accept all challenges for a certain perio and maintain its supremacy during that time, if it woul retain the sign. If it succeeds in doing this, the da will be added, "for the Year 19—," and the sign will r main at No. 1.

If No. 2 mine wants the sign, and has a team whic they think can beat No. 1, a contest will be arranged o six weeks' notice, and if No. 2 team wins, the sign goes u at No. 2, under the same conditions. It is hoped that th will stimulate and maintain a keen rivalry between t different teams in the camp. These contests are all in a dition to the regular annual contest for a handsome lo ing cup, occurring each Labor Day.

When the keen edge of the rivalry created by the sig wears off, something else will have to be devised, in somewhat different line. At present I have no idea wh this may be, but I have faith that some other scheme will present itself during the interval, so that interest may be again aroused, and the large and enthusiastic membership will continue to grow and thrive.

*Mine superintendent, Superior Coal Co., Superior, Wyo.

⁂

Cash Prizes for Safeguarding Lives

At every colliery operated by the Coal-Mining Department of the Delaware, Lackawanna & Western R.R., placards have been posted offering $100 in cash prizes for the most valuable and practical suggestions on the prevention of accidents. The first prize is $25; the second, $20; the third, $15; and there are two of $10 and four of $5 each.

The suggestions must consist of not over 1000 words and are to be deposited in one of the 35 large boxes installed at each colliery, and labeled "Safety-First Suggestions."

This is only part of an elaborate and comprehensive plan for the promotion of safety in the mines. The Lackawanna has formed a series of committees to have charge of all safety work and devices and through which all suggestions will be sifted.

Committees of Safety

The central committee consists of the superintendent, who is chairman; the general attorney, who is secretary; the chief engineer, electrical engineer, superintendent of construction and repairs, superintendent of washeries, the superintendents of the four districts into which the Lackawanna operations are divided, and a special engineer.

Next in the system come the four district committees, consisting of the district superintendent, assistant district superintendent, district mining engineer, district electrician, district mechanic, inside foreman, fireboss, a miner, a track layer and a runner.

In addition to this there is a mine committee for each separate district in the mines for which an inside foreman is responsible. These committees consist of the fireboss, safety inspector, a miner, a track layer, a timberman and an electrician inside the mine, and a breakerman, a prop cutter, a carpenter and an engineer from among those employed outside.

The first meeting of the district and mine committees of districts 1, 2 and 3 was held on Wednesday, Jan. 13, at the Railroad Y. M. C. A., in Scranton, and that of the district and mine committees of district 4 convened at the Wilkes-Barre Y. M. C. A. on Friday, Jan. 15.

Frequent Meetings to Consider Many Suggestions

The mine committees will meet frequently, probably once a week, and their secretaries will send the notes of their meetings to the district committees. These will meet every two weeks and their secretaries will send their reports to the central committee which will meet monthly.

This coöperation between the officials and employees of the company is expected to have a markedly beneficial effect. The keys of the boxes in which the safety-first suggestions will be deposited are held by the central committee, so there is no danger of their being tampered with in transit and every suggestion will reach headquarters. The simple and more inexpensive plans will be handled by the local committees, and the more elaborate will be passed upon by the central committee.

Copies of the celebrated Lackawanna Safety-First book with photographic illustrations of the right and safe and the wrong and dangerous way to do everything in the mines have been furnished to every member of every committee.

The first joint meeting of the Central and District Safety-First Committees was held in Scranton on Jan. 4, and several homely sayings and aphorisms relating to safety were suggested.

⁂

Christmas at the Company Store

The United Supply Co., of West Virginia, and the Union Supply Co., of Pennsylvania, subsidiaries of the United States Steel Corporation and its affiliated coal companies, dressed up a Santa Claus in all the 71 stores at the coal mines, and distributed candy to the children, in all giving away 22 tons. This was put up in appropriate Christmas boxes, and to it were added oranges, apples and nuts.

However, Santa, in these mining towns was divested of his recognized characteristic of secrecy, for he was escorted, at least in Gary, W. Va., by the village band. The store companies mentioned sell turkeys to every one at cost at both Thanksgiving and Christmas, and at Easter, eggs and chickens are likewise sold without profit.

⁂

Anthracite Region Prosperous

At no time in its history has the anthracite region of Pennsylvania enjoyed such a period of peace and prosperity as that of the last ten years. Edward W. Parker says in his "Production of Coal in 1913" published by the United States Geological Survey that it requires no stretch of the imagination in order to believe the foregoing claim when the financial concessions made by the operators are taken into consideration.

The first of these was the establishment in 1901 of the summer discounts which have resulted in a marked increase in the number of days the employees have been able to work, and in the uniform distribution of the shipments throughout the twelve months of the year. From a minimum of 195 working days in 1906 the average has ranged as high as 257 in 1913, with a mean average for the last ten years of 220 days. In 1913, the railroad shipments reported to the Bureau of Anthracite Coal Statistics amounted to 69,069,628 long tons, of which 50.3 per cent. were sent out during the winter months and 49.7 per cent. in the summer months, thus distributing employment in the anthracite region evenly throughout the year.

Wage rates since 1902 have been advanced 21 per cent. (10 per cent. in 1902 and 10 per cent. more in 1912), and as the average working time in that decade exceeds that of the previous one by 23 per cent., it may be computed that the average yearly earnings in 1913 were nearly 45 per cent. more than before the spring reductions went into effect and before the strike of 1902 resulted in the first 10 per cent. advance in wages. Thus the mine workers are now getting both more work and more pay.

Discussion By Readers

Mining Laws, Legislation and Mine Regulations

Letter No. 23—The discussion of needed mining laws and legislation grows more and more interesting as it advances; and many important points have developed that should be given attention in the framing and revision of mining laws, in the different states. One point that is of great interest in Pennsylvania relates to the danger attending mining operations in oil and gas fields.

In Greene County, of this state, there are thousands of acres of virgin coal that are about to be developed. The fact that countless oil and gas wells penetrate the coal strata, in this section, makes the work of coal mining particularly hazardous. These wells are from 1500 to 2000 ft. in depth; and, since the Pittsburgh seam of coal outcrops on the western bank of the Monongahela River and dips west, there is absolutely no protection afforded against the entrance of gas through these well-holes into the mine workings when this coal is being developed.

In most cases, a 6- or 7-in. casing has been placed in a 12- or 14-in. drillhole, and a packer-ring, or something of the same nature, is supposed to have been placed around this casing, at the bottom, to prevent the gas from circulating about the outside of the pipe.

Discussing this matter with a life-long resident of the section, I was told that when oil was worth as much as $15 a barrel, many property owners would drill a hole on their land, which would yield from 2 to 3 bbl. of oil per day. As a rule, no casings were inserted into these holes. As oil became more plenty and the price fell, many of these private wells were abandoned, because the returns were insufficient to warrant their being maintained. In most instances, these wells have been forgotten and their location lost.

In the section of country to which I refer, there are two gas-bearing strata or sands, namely, the "Dunkard" and the "Big Injun." When boring for oil, it was necessary to bore through these strata. In boring for gas, in order to get a heavy flow, it was necessary to bore to the Big Injun stratum, no attention being paid to the gas coming from the Dunkard sands. I am informed that the gas pressure ranges from 20 to 50 lb. gage. That such a pressure of gas would prove a serious menace in mine workings to which they might gain access is certain. I am informed that one of these gas wells is supplying sufficient gas for use in an eight-room house.

I recall two instances where such wells were struck while driving rooms in the mine. This was due, in one instance, to an error of the mine foreman in locating the hole on the mine map; but, fortunately, this proved a dry well, having been plugged with cement. In the other instance, the trouble was due to an error of the engineer, who failed to record the location of the hole on the surface. In this case, although there was a heavy pressure of gas recorded in the casing, no gas was issuing from the hole when struck. Later, however, this hole gave considerable trouble from gas coming from the Dunkard sands, due to a faulty packer-ring.

It seems quite unreasonable to compel coal operators to leave a large reserve of, say 40 or 50 ft. of solid coal around each of these wells, instead of compelling the gas companies to take proper precautions when boring the holes, so as to prevent the escape of gas therefrom into the workings of a future mine. In my opinion, all abandoned gas or oil wells should be filled with cement so that it would completely surround the casing throughout the depth of the hole. I believe this would go far toward preventing serious disasters arising from the presence of these holes. I hope that this matter will receive the attention it demands at the hands of the law makers that the hazards of mining may be reduced.

D. W. S.

—————, Penn.

Letter No. 24—In discussing the question of mining laws, John Verner, in his Letter No. 16, COAL AGE, Jan. 2, p. 26, presents some very interesting facts in regard to interstate mines. Those who followed the discussion of the certificate law, in COAL AGE, something over a year ago, will recall that attention was drawn to similar conditions to those described by Mr. Verner.

The problem discussed at that time, however, did not relate to the workings of a single mine extending across the border into another state; but related to the certification of mine foremen in one state differing from that in a border state. Attention was drawn to the fact that a mine foreman holding a certificate in one state could not attempt to hold the same position in another state, by virtue of such certificate, even though the mines in question were of the same character and their workings were adjoining each other, in the same seam.

In my Letter No. 8, COAL AGE, Vol. 4, p. 988, discussing the certificate law, I suggested the *classification of mines*, and cited the attempt then being made in West Virginia to classify those mines as "nonhazardous," "hazardous" and "extra hazardous." In his Letter No. 14, COAL AGE, Jan. 2, p. 25, John Rose informs us that the mining laws of Tennessee provide for the examination of foremen in four separate classes, A, B, C and D. It seems to me that some such classification of *mines* should be made by Federal legislation, or by providing a uniform standard in the mining laws of the coal-producing states. In my opinion a similar classification should apply to all legislation relating to safety in mining. While I would not carry this classification to extremes, I believe that it should be so drawn as to make possible the proper safeguarding of life and property in and about mines, without imposing undue hardships on the operators, certified mine officials, or miners. I would suggest that such a classification should have reference to mines as being "gaseous," "nongaseous" or "dusty," and should specify with respect to the roof conditions as being "safe" or "treacherous."

I believe fully in uniform state examinations for the positions of mine foreman, fireboss, etc., and in a legal provision for a suitable interchange of certificates issued in different states. A foreman who is competent to take charge of a mine in *one* state is certainly competent to take charge of a mine presenting the same general conditions in *another* state.

I agree fully with Mr. Rose's suggestion that a foreman holding a certificate of *any* class should be permitted to act as assistant foreman in the next higher class. With Mr. Rose, I believe that this would give him an opportunity to gain the experience and training that would enable him to secure the higher certificate. Such a provision, by law, would in no way lower the standard of safety, as the responsibility and authority would still rest upon the foreman in charge.

I do not believe in lowering the standard of examinations for certificates of competency. The man who is to be held responsible for the safety of mine operations should be qualified for such position by education and training, and his character should stand the necessary test. The law should provide for the revocation of a certificate, in any position of responsibility, on sufficient proof of drunkenness, neglect of duty, or other act of incompetence.

In respect to interstate mines, I would suggest that state laws should provide for the inspection of the entire mine by one inspector only. I would place the whole mine under the jurisdiction of the inspector of the state in which the surface equipment of the mine is located. Where two inspectors of different states are obliged to coöperate in the inspection of the same mine, it would not always be possible to adjust matters as easily as was done in the case cited by Mr. Verner.

In closing, permit me to say that all the various phases of coal mining should be discussed at this time. I gladly welcome criticism or further comment on my suggestions. Legislators cannot be expected to be as familiar with mines and mining operations as those who are connected with the industry; and the purpose of Coal Age, in this discussion, I understand, is to put before law makers such a summary of the important needs and requirements as will enable them to act intelligently. To this end, the hearty coöperation of all practical men engaged in mining is solicited.

G. N. Lantz.

New Straitsville, Ohio.

Letter No. 25—In reading the interesting letters bearing on the question of mining laws and legislation, I am persuaded that, generally speaking, the present mining laws cover many important points; and that if these laws were strictly obeyed greater safety in mining would result. It is quite obvious to everyone, however, that there is a bad kink at present existing between the inspector, superintendent and mine foreman. In too many cases, the orders issued from the office fly off at a tangent, so to speak, and are absolutely lost before reaching their point of application.

As has been clearly shown, the position of mine foreman is, in too many instances, an anomalous one. Practically, this individual is 90 per cent. a company man and 10 per cent. a government agent. He is, in fact, a "bumping block" between the inspector and the company; and, in this respect, is admirably placed to act as receiver-general for knocks coming from both directions. The company is too prone to regard the mine foreman as the responsible party in respect to the compliance of mining operations with the mining law, while at the same time withholding from him their support and coöperation in this regard. Indeed, the ability of the foreman to successfully dodge an issue with the mine inspector makes him, too often, more valuable in the eyes of his superintendent.

As an illustration of the lack of support of and coöperation with the foreman, on the part of the company, in the matter of carrying out a mine inspector's orders, let me suggest a common instance, as follows: The mine inspector visits the mine, and, after making his examination, orders the mine foreman to make certain improvements to comply with the law. The improvements will necessitate an outlay of, say $200 or $300. The foreman appreciates the benefit to be derived therefrom and is as anxious as the inspector that the work be done at once. It is necessary, however, that the superintendent authorize the work before this can be done; and his comment on the inspector's order is, "We have too much deadwork expense on this pay, and we will let that matter go for the present." As a result, the inspector finds on his second visit that the work has not been done and threatens the foreman with prosecution if the order is not complied with immediately. This is a quite frequent occurrence at the present day.

While there has been much discussion of this knotty question, few remedies have been suggested for its amelioration. In order to stimulate thought along this line, I offer the following suggestion, in the hope that it may lead to a practical solution of the problem and prove a benefit to all concerned, particularly the mine foreman, who at present occupies an extremely nebulous position. The suggestion is as follows:

Mine inspectors' orders should always be written in duplicate, on properly prepared forms supplied to him by the government. Such orders should state, in clear, concise terms, the particular improvements required in order to comply with the law. The mine foreman should be required to read the order and sign his form in the presence of the inspector, thereby signifying that he fully understands what is required. The order, in duplicate form, and signed by the mine foreman, can then be handed by him to the superintendent to obtain his authorization that the work should be commenced and completed at a certain specified date. In case the work should not be accomplished in the time specified, it would then be possible to trace and fix the responsibility on the proper party. Such an arrangement, or a similar one, would certainly be fair and just to all; and anyone who would object to its adoption would probably stand watching.

I want to refer, here, to a similar condition as existing between the mine foreman and the miners in his charge. This condition is well illustrated by the instance cited in Letter No. 8, Coal Age, Dec. 12, p. 958. Referring to a fatal accident, the correspondent states as follows:

> It is claimed by the mine foreman that he directed the man, an hour before the accident occurred, to set props under the roof as it appeared to be unsafe. Having done this, he proceeded to inspect other working places and was so engaged when news reached him of the accident.

In this case it appears that the mine foreman was prosecuted by the mine inspector for not staying and seeing that his (the foreman's) orders were obeyed. The lesson taught by this instance is that, while the foreman probably instructed the miner, as he claimed, he had no proof that he had given the order to set the props, and merely made this claim to shield himself from any apparent neglect of duty on his part.

The general adoption of some form of compensation law in most of the coal-mining states, today, makes it more necessary than ever that mining laws should be so written as to fix the responsibility for neglect of duty as well as for any accident, on the proper party. In the case cited, if the mine foreman gave the order and the accident occurred after a reasonable time for the work to have been done by the miner, the responsibility clearly rests on the victim of the accident. On the other hand, if no order had been given by the mine foreman, the responsibility for the accident clearly rests on that official.

In order to avoid the quandary and fix the responsibility in such cases, I would suggest that all orders of the mine foreman should be delivered in writing to the miner, the order to specify the time of the day and the date when given, and be nailed to a post in the miner's room, after being signed by the miner himself. The law should fix a penalty for the removal of such an order from the post by any unauthorized persons. This would provide the necessary evidence required to fix the responsibility of a possible accident that might occur as a result of the neglect of a miner to comply immediately with the orders of his foreman.

I believe, also, that the time will come when, in order to secure the greatest immunity from accident, due to explosions of gas and dust in mines, a law will be placed on the statute books of all coal-producing states, prohibiting the use of open lights in *all* mines. While I realize that a host of mining men would oppose such an enactment, I am fully convinced that every intelligent mining man should favor such a law.

SUPERINTENDENT.

Pittsburgh, Penn.

The Foreigner in Mining

Letter No. 14—My special attention was drawn to Letter No. 13 in the recent discussion of The Foreigner in Mining, COAL AGE, Jan. 16, p. 137. There has been much talk over this subject, with the result that the coal operator or the officer in charge begins to feel that, in the future, a foreign miner or laborer will be of better value to him than an American-born miner, because he does more labor for less money, and as writer Mr. Wesvania points out this class should be Americanized and become good citizens and they would be better workers.

But this seems to be a hard problem to solve, because naturalization laws require an applicant for citizenship to live in one place for five years and to furnish witnesses that have known him for five years. My personal experience is like that in Letter No. 12, and it is a fact that foreigners are not treated in the same manner as American-born miners. For example, Johnny got wet place in mine, and hard push-cars; boss come in his room for inspection; Johnny complains that he cannot make enough to feed his family; boss make promises that whenever he finishes his room he will give him a good, dry place. So Johnny is compelled to work in the wet place and got less cars than his American fellow workmen. Then he put up a kick that he was not given an equal turn by the drivers; and result was that a driver called him a "Hunkey" and told him to "shut up or move out." It was different with Willie. He came and got the job. Boss took him to Johnny's place and advised him how he could do with this place, and gave him 50c. yardage and a free turn.

In my own case I had spent my money for two patents (U. S. A. and Canada) and became penniless. In the mine, I was treated same as Johnny; and appeared before the superintendent and asked him to give me just enough to keep my family. I showed him that boys from town were working every day while those in company houses are left behind and only get work enough to pay rent. So they feel that they are not treated as American labor.

The writer of Letter No. 13 says that "many foreigners come to this country for the purpose of making easy money in a short time," and "are sending this home to pay for the farm." That is a fact; but he fails to show *why* they come in such numbers that every mining camp is so crowded, in nearly every state. It is because they do not feel *free* in their native country; and so they are forced to seek freedom, liberty and higher wages for their labor here. Back home every able man is paid for his day's work (from sunrise to sunset) about 2 kronen and 40 fillers (48c.), which is the highest wages, and only paid on farms, during the summertime. Many coal operators employ these men in the mines, as low-class labor; but they are always willing and able, and work in good faith. Education is needed; but how?

About 50 per cent. of all foreign miners have properties and families or parents in the old country, and they are just waiting for the war to cease to bring them over. The other half would gladly become Americanized if they could do so according to law. One thing is true and that is our men (foreigners) do not enjoy the short-day work (8-hour day). Further, if you want to make them progress in education, you must clear the mining camps from booze and forbid to ship any intoxicating drink, and you will find that every wheel will be running right. Also, foreigners don't look to furnishing their homes elegantly, but they enjoy good meals and common, cheap clothing, with the intention of saving money for old age. I will gladly give more facts, if desired, as I am well acquainted with all this class of my countrymen and know their habits in every respect.

JOHN MAJER.

Garrett, Penn.

Letter No. 15—In his Letter No. 11, COAL AGE, Jan. 2, p. 27, Charlton Dixon, either deliberately or unwittingly, misapplies my reasoning in the analysis I offered of the character of the class of foreigners coming to America. Mr. Dixon styles my reasoning as being *"a priori,"* or from cause to effect, instead of *analytical* or from effect to cause.

I have stated, as a fact derived from years of personal intercourse and study, that Latin-Europeans are, as a class, morally perverted. This is an effect. In the study of probable causes, I find that mal-government and mal-instruction are both productive of moral perversion; and, therefore, conclude that the Latin-European has been subject to these influences, which have formed his character.

The same conclusion could also be reached by reasoning *a priori* from the same cause. As long as the foreigner is subjected to mal-government and mal-instruction, so long will he remain in the same moral condition. Since such a cause does not align with the principles of

American society or American citizenship, it is immaterial to the truth of this proposition whether the effect be the direct or indirect result of the cause; it proves the conclusion.

Mr. Dixon's intimation that my statements are inimical to the foreigner is true only in the sense that the physician's diagnosis is inimical to his patient. If to express a vital truth be *inimical*, to be silent would be *criminal*.

In support of his statement that the foreigner becomes as good a coal miner as the American miner of 25 or 30 years ago, Mr. Dixon quotes the enormous coal production of the present time. He seems to forget that coal mining was then, practically, an industry of manual labor and personal skill on the part of the workman; while today it has become a mechanical industry in which the workman is regarded as a part only, but not a very essential part, of the machine; and the present time does not, therefore, offer the same opportunity for the development of skilled miners.

Mr. Dixon's reference to the "industrial supremacy" of this country being so dependent on foreign labor is no doubt highly flattering to that class; but would it not be more pertinent to ask, what are we going to do with the foreigner? If the proper answer to this question is not found it may soon be necessary to ask, what will these foreigners do with us?

In reference to my "recanting" when I say that the foreigner "is still capable of mental education," I would remind Mr. Dixon that the education of which I consider the foreigner incapable is that of his perverted moral nature. Education may be mental, moral, or physical, all of which are necessary to the full development of man.

In his closing remarks, Mr. Dixon claims to see, in the loyalty displayed by many foreigners now returning to the defense of their homeland, "excellent material with which to make good American citizens." This loyalty of the foreigner is exhibited with respect to foreign institutions; but to become an American citizen, he must forswear allegiance to all foreign potentates and take oath to support the Constitution of the United States which, by that act, he adopts as his own, together with the institutions that the Constitution considers sacred. From Mr. Dixon's previous arguments, one is forced to conclude that this loyalty of the foreigner is demonstrated in support of the very principles that he is supposed to have found unbearable in his own country—and this after enjoying years of the blessings of American freedom. I would ask, Do these facts reveal the foreigner as an element for absorption into American social and political life?

I. C. Parfitt.

Jerome, Penn.

Study Course in Coal Mining

By J. T. Beard

The Coal Age Pocket Book

This principle known as the **law of tangents** can always be applied when one angle and the including sides are given, to find the remaining angles and side of a triangle.

Example—Given, in a triangle, a = 300 ft., b = 500 ft. and C = 120 deg.; to find A, B and c.

Solution—The two unknown angles are first found by applying the law of tangents to find their half difference, which added to their half sum will give the greater; or subtracted from their half sum will give the lesser of the two angles. In this case, since b is greater than a; the angle B is greater than the angle A; and we have

$$\begin{aligned} Tan\ \tfrac{1}{2}(B - A) &= \frac{b - a}{b + a}\ tan\ \tfrac{1}{2}(B + A) \\ &= \frac{500 - 300}{500 + 300}\ tan\ \tfrac{1}{2}(180° - 120°) = \frac{200}{800}\ tan\ 30° \\ &= \frac{1}{4} \times 0.57735 = 0.14434 \end{aligned}$$

and ½ (B — A) = 8° 13′. Then, since ½ (B + A) = 30 deg.,

$$B = 30° 00' + 8° 13' = 38° 13'$$
$$A = 30° 00' - 8° 13' = 21° 47'$$

Then, applying the law of sines, to find c, remembering that sin 120° = sin 60° = 0.866,

$$c = \frac{sin\ C}{sin\ B} \times b = \frac{sin\ 120°}{sin\ 38° 13'} \times 500 = \frac{0.866 \times 500}{0.6186} = 700\ ft.$$

2. The principle known as the **law of cosines** can, also, be applied, in the solution of triangles when one angle and the including sides are given, to find the remaining parts. This principle is expressed by the formula

$$a = \sqrt{b^2 + c^2 - 2\ bc\ cos\ A}$$

In applying this formula, the letters can be changed correspondingly to conform to any given case. Thus, in the last example where a = 300 ft., b = 500 ft. and C = 120 deg.; and it is required to find c, A and B, we have the following:

Solution—Here, C = 120 deg.; and cos 120° = —cos 60° = —0.5; hence,

$$\begin{aligned} c &= \sqrt{a^2 + b^2 - 2ab\ cos\ C} \\ &= \sqrt{300^2 + 500^2 - 2 \times 300 \times 500\ (-0.5)} = \sqrt{490{,}000} = 700\ ft. \end{aligned}$$

Then, applying the law of sines to find the angles A and B,

$$Sin\ A = \frac{a}{c}\ sin\ C = \frac{300}{700} \times 0.866 = \frac{3 \times 0.866}{7} = 0.3711$$

and A = 21° 47′. Then, since A + B = 180 — 120 = 60°,

$$B = 60° 00' - 21° 47' = 38° 13'$$

3. There is still a third method of solution that applies when one angle and the including sides of a triangle are known. This method embraces the three circular functions, sine, cosine and tangent; and may be styled the **law of circular functions.** It is expressed by the formula

$$Tan\ A = \frac{a\ sin\ C}{b - a\ cos\ C}$$

As before, the letters of this formula can be changed correspondingly, giving the following:

The Coal Age Pocket Book

Solution—Given a = 300 ft., b = 500 ft. and C = 120 deg.; sin 120° = sin 60° = 0.866; and cos 120° = —cos 60° = —0.5; and substituting these values in the last formula, we have

$$Tan\ A = \frac{a\ sin\ C}{b - a\ cos\ C} = \frac{300 \times 0.866}{500 - 300\ (-0.5)} = \frac{259.8}{650} = 0.3997$$

and A = 21° 47′. Then, as before, B = 60° 00′ — 21° 47′ = 38° 13′.

The remaining side c is then found by applying the law of sines, as previously explained.

Case 4—When the three sides of the triangle are given, to find the three respective angles, it is only necessary to apply the law of cosines, solving the formula previously given so as to express the value of the angle A, in terms of the sides a, b, c; thus,

$$Cos\ A = \frac{b^2 + c^2 - a^2}{2\ bc}$$

Example—Taking the same triangle as in Case 3, the three sides are given as follows a = 300 ft., b = 500 ft. and c = 700 ft.; the angles A, B, C are found thus:

Solution—Substituting the given values in the last formula given above,

$$Cos\ A = \frac{b^2 + c^2 - a^2}{2\ bc} = \frac{500^2 + 700^2 - 300^2}{2\ (500 \times 700)} = 0.92857;\quad A = 21° 47'$$
$$Cos\ B = \frac{a^2 + c^2 - b^2}{2\ ac} = \frac{300^2 + 700^2 - 500^2}{2\ (300 \times 700)} = 0.78570;\quad B = 38° 13'$$
$$Cos\ C = \frac{a^2 + b^2 - c^2}{2\ ab} = \frac{300^2 + 500^2 - 700^2}{2\ (300 \times 500)} = -0.5;\quad C = 120°$$

Or, having found two angles, as A and B, the remaining angle C can be found by subtracting their sum from 180 deg.

$$C = 180° - (21° 47' + 38° 13') = 120°$$

Case 5—When two parts of a **right triangle** are known, other than the right angle (90°), the remaining parts are found by applying the following principles or formulas:

1. The square of the hypotenuse is equal to the sum of the squares of the two sides (altitude and base).

Let a = altitude, b = base and c = hypotenuse; then,

$$a^2 + b^2 = c^2$$
$$a = \sqrt{c^2 - b^2}$$

2. The laws of sines, cosines and tangents all apply to right triangles; but it is important to remember that, since C = 90 deg., sin C = 1; and cos C = 0. Also, since A + B = 90, tan ½ (A + B) = tan 45° = 1.

By the **law of sines,** $a = c\ sin\ A$
$b = c\ sin\ B$

By the **law of cosines,** $a = c\ cos\ B$
$b = c\ cos\ A$

By the **law of circular functions,** $a = b\ tan\ A$
$b = a\ tan\ B$

By the **law of tangents.** $tan\ \tfrac{1}{2}(A - B) = \frac{a - b}{a + b}$

Inquiries of General Interest

The Formation of a Flame Cap

I was much interested in the answer given to the inquiry in regard to the formation of a flame cap, Coal Age, Dec. 12, p. 961. It seems to me, however, that this question, in its relation to the detection of gas in mines, by means of safety lamps, will warrant a yet further investigation.

It has long been known that a certain type of safety lamp, burning gasoline, will generally show a very distinct cap even when burning in pure air containing no gas; and it is practically impossible to distinguish this cap from one formed by the presence of marsh gas (CH_4) in the air surrounding the lamp. I may say that it would require an acute observer and one having a remarkably good eyesight to distinguish between the cap formed on the flame of such a lamp burning in pure air, and the cap formed on a lamp burning ordinary sperm or cottonseed oil, when placed in air containing a small percentage of marsh gas or in the gaseous mixtures commonly found in mines.

It has been suggested that, in some cases, possibly, a rather slack wick or a defective stopper in the lamp may be responsible for an excessive evaporation of the gasoline contained in the lamp. It is my experience, however, that even when using a lamp that is in perfect condition, the cap to which I have referred is plainly in evidence; and, I believe there is no doubt that this cap has, in many instances, been mistaken for a cap produced by the presence of gas in the mine air.

I would suggest that a comparative analysis of gasoline vapor and marsh gas or methane (CH_4), together with gaseous mixtures containing other hydrocarbon gases, such as olefiant gas (C_2H_4), which is frequently found in mines, associated with marsh gas, would be both interesting and instructive to Coal Age readers. It would be interesting to know the specific gravities, temperatures of ignition, color and appearance of the flame caps, together with the composition of such mixtures as are commonly found in coal mines.

W. H. Moore.

Nanaimo, B. C., Can.

Attention has been frequently drawn, in Coal Age, to the fact that any lamp burning a highly volatile oil is not a good lamp for testing for gas, owing to the ready volatilization of the oil, which is greater as the lamp heats in gas. The following quotation, referring to the use of a bonneted lamp burning volatile oil, for testing for gas, is taken from Coal Age, Vol. 1, p. 619:

> The lamp is not a good testing lamp, for several reasons, namely, the lamp is bonneted, which fact together with the vaporous oil burned modifies, at times, the atmosphere in the combustion chamber, so that it does not truly represent the gaseous condition of the outside air. The lamp heats readily in gas, the oil volatilizes more quickly, and the lamp gives higher indications than it should, after being exposed to gas a short time. The lamp flame is easily extinguished and when relighted, after a short period of extinction, the lamp may flash or pass flame.

The evaporation of the volatile oil from the wick of the lamp cannot be prevented and varies with the temperature of the lamp. As is well known, a testing lamp exposed to gas for a short time frequently becomes so heated that it cannot be held in the hands with comfort. Under these conditions, a lamp burning volatile oil will give a higher indication than a lamp burning an ordinary nonvolatile oil. As stated by correspondent, such a lamp frequently exhibits a clearly discernible cap when burning in pure air, owing to the oil vaporized in the combustion chamber.

Another quotation from Coal Age, Vol. 3, p. 816, giving the essential features of a good safety lamp for testing for gas in mines reads as follows:

> A pure sperm or cottonseed oil is better adapted for testing than a volatile oil, because the latter volatilizes more rapidly as the lamp heats in gas, and gives unreliable results in testing.

In regard to a comparative analysis of gasoline vapor, methane and other hydrocarbon gases and gaseous mixtures, it may be stated that these mixtures commonly found in mines consist chiefly of methane and variable quantities of olefiant gas (ethene, C_2H_4), carbon dioxide (CO_2) and possibly slight quantities of carbon monoxide (CO), due to the presence of fine dust floating in the air and which is converted into this gas, in contact with the flame.

The flame cap produced by methane, in the absence of other gases, is a pale blue cap that is difficult to discern when a small percentage of the gas is present; but which becomes plainly visible when the proportion of gas reaches 2.5 per cent.

The presence of even a small percentage of olefiant gas, associated with the methane, increases the luminosity of the cap and renders it more readily discernible. Larger percentages of olefiant gas, when present, render the flame somewhat unsteady, due to the presence of the gas increasing the explosive condition of the mine air. When fine dust is present in the air its conversion into carbon monoxide (CO) lengthens both the flame and its cap, owing to the increase of the heat of the combustion and the temperature of the flame. Because of these variable conditions, due to the varying composition of the gaseous mixtures in mines, the comparative analyses of gasoline vapor and the gaseous mixtures found in mines would have only a suggestive value, by indicating the relative effect that these gases have on the lamp flame, which effect we have just explained in general terms.

The average specific gravity of gasoline, which is a product of the distillation of petroleum, may be taken as 0.70 (Coal Age, Aug. 29, p. 356). The vapor of gasoline flashes or takes fire, in contact with flame, when the gasoline has a temperature that is considerably below zero (Fahr.). The average composition of gasoline may be assumed as: carbon, 85 per cent., by weight, and hydrogen, 15 per cent., with less than 1 per cent. of water vapor. The calorific power or heat value of gasoline is practically 20,000 B.t.u. per lb., as compared with 23,500 B.t.u. for methane, assuming complete combustion.

Examination Questions

Alberta, Canada, Examination for First-Class Certificates, Held June 23-25, 1914

(Selected Questions, Continued from Last Week)

Ques.—It becomes necessary to wall off a gob fire; and, to do so effectively, several working places have to be included in the area affected by the stoppings. By what means would you ascertain when the stoppings could be removed? What dangers would you guard against in removing them?

Ans.—Assuming that the stoppings have been well built and sealed, careful tests should be made, from time to time, to ascertain the condition of the air within the inclosure. To provide for doing this, pipes should be built into the stoppings near the intake and return ends, respectively. Such pipes, for testing the air, are placed near the roof. It is customary also to leave another pipe at the bottom, to drain the area. These pipes are supplied with stop-cocks. To test the air behind the stopping, the stop-cock in the pipe close to the roof is opened and the air flowing therefrom tested with a safety lamp. Evidence that fire still exists within the inclosed area may be found by cautiously sniffing the air coming from the pipe. The temperature of the air should also be taken, as evidence of the progress made in the extinction of the fire.

Great precaution is required in the removal of stoppings, under these conditions. First, a small hole should be made in the stopping at the return end of the section; and time should be given for the air pressure to adjust itself within the inclosure. Only safety lamps should be used when performing this work. The hole in the stopping may then be enlarged sufficiently to permit of a good circulation of air through the opening. A small hole should now be made in the stopping at the intake end, and time should be given for the air entering this opening to create a circulation through the inclosure. The results should be carefully watched at the return end, by making frequent tests at this point with a safety lamp. Upon observing any indication of increase of temperature or other evidence of fire within the area, the intake stopping should be promptly closed, and the stopping at the return end rebuilt and more time allowed for the extinction of the fire.

Ques.—During rescue work underground, after an explosion, a rescue party wearing breathing apparatus and on returning along a roadway that was previously clear of gas, finds that it contains a considerable percentage of carbon monoxide (CO). How do you account for this and what instructions will you give to guard against disaster from this source?

Ans.—Assuming that the previous observations showing the entry to be clear of gas were carefully made, the presence of carbon monoxide observed in this entry, on the return of the rescue party, can only be accounted for on the ground that this gas was accumulated in one of the rooms, or has been generated since by a gob fire in some adjoining workings and had escaped the notice of the rescuers on their trip inby.

To guard against such danger, it will be necessary to make a more thorough investigation when passing into the mine. When going in, the rescue party should not close any door after passing through the same, unless the section of the mine in which the ventilation is controlled by such door has already been explored and found to be safe and free from gas. By closing such a door affecting the ventilation of an unexplored section, the rescue party endanger their own lives, since the gas from that section will then be forced out upon them.

Ques.—Of what value are regular readings and records of the barometer and thermometer? Under what conditions are readings of the hygrometer of value? If a barometer, at a mine, registers an average of 27 in., what would be the approximate elevation above sea level and the atmospheric pressure, in pounds per square inch?

Ans.—Regular barometer readings, in connection with mining operations, are important in respect to their indicating the expansive effect produced on the mine air, which expansion always accompanies a sudden fall of the barometer or decrease of atmospheric pressure. As a result of this, the air and gases confined in large abandoned areas are forced out into the live workings, causing the explosive condition of the mine air to be considerably increased for a time.

Regular readings of the thermometer taken inside and outside of the mine are important as showing a greater or less capacity of the air for carrying moisture or absorbing moisture from the mine. Hygrometer readings are of greatest value in a dry and dusty mine. They show the relative humidity of the mine air and thus indicate its capacity for absorbing moisture from the mine and rendering it dry and dusty. A surface reading of 27 in. of mercury corresponds, under normal atmospheric conditions, to an elevation of 2800 ft. above sea level. The corresponding atmospheric pressure is $27 \times 0.491 = 13.257$ lb. per sq.in.

Ques.—The underground workings of a mine are divided into three districts, each district being ventilated by a separate split of air. If the resistance to the passage of air in each split is unequal, describe fully by what means you would provide an equal quantity of air for each district.

Ans.—Assuming that the resisting powers of the several splits are unequal, to obtain an equal distribution of air between them, it will be necessary to introduce regulators to control the circulation in two of these splits. By adjusting the openings or areas of passage through these regulators, it is possible to produce an equal distribution of the air in the several splits. For this purpose, either the box regulator or the door regulator can be used. The former is generally located on the back entry near its mouth; while the latter is always located at the intake end of the split. The regulator, in either case, should be so arranged as not to interfere with the haulage of the coal.

Coal and Coke News

Harrisburg, Penn.

Although he did not refer directly to either the agitation for better surface protection in the anthracite coal region or the litigation now before the courts relative to a tax on anthracite coal, provided by the Roney bill, Governor Martin G. Brumbaugh, in the course of his inaugural address delivered on Jan. 19, intimated strongly that he favors both for the people of the anthracite region of the state. His language cannot be misconstrued, especially when he said:

> Once Pennsylvania was rich in natural resources and unequaled in beauty. Much of its wealth has been taken from it. Much yet remains. It has passed to private and corporate agencies. They have rights that must be respected. So also have the people of the state a claim upon these great natural assets. In their marketing the commonwealth plays an important part. In the returns the people ought to have a share. A reasonable tax upon our great natural resources as they flow to our markets is both fair and wise.

On the matter of surface safety, the governor's message says that, after all the people are the great asset of the commonwealth. "That they may be safeguarded in their health, their education, their homes, their worship, their property, their regulated freedom, their toil, should be our constant endeavor."

The appointment of Francis Shunk Brown as attorney general is important to the coal industry in connection with the fight on the Roney anthracite tax act, as he is one of the men who drafted that measure.

Judging from the personnel of the Senate and House mines and mining committees the outlook for legislation in the interest of the anthracite workingman is not particularly bright. No members from the anthracite region hold places on this committee. The House chairman is Mr. Hess, of Lancaster County, and the Senate chairman is Mr. Thompson, from the bituminous region.

In the 1913 session every bill affecting anthracite miners that was introduced in the House saw the light of day and was either defeated on the floor of that branch or killed by the Senate committee. To prevent a repetition of this is evidently the intention of the House leaders, and the committee will not, under any circumstances, promiscuously release all bills referred to it.

The Question of Taxes

State taxes on real estate, on bituminous coal, gas, oil and gasoline are being considered by some of the legislators as a means of making up the deficiency in the state revenues for the next two years. The adjudication of the anthracite tax will take months, and practically $5,000,000 to $6,000,000 in state funds are already tied up. It was contended in the Dauphin County Court that the anthracite tax was unconstitutional as class legislation, and it is likely that the present legislature will pass a bill placing a tax on bituminous coal.

This action would be in keeping with the recommendations of the Tax Commission two years ago. Francis Shunk Brown, now attorney general, was counsel for the commission which recommended a state tax on anthracite, and suggested also taxing bituminous coal, natural gas and oil. It recommended a commission to consist of Pennsylvania, Ohio and West Virginia men, and a resolution carrying out this suggestion was passed by the Pennsylvania Legislature of 1913, but the other states never took action.

The present legislature cannot appropriate within $17,000,000 of what the 1913 session did unless the State Treasury balance is to be endangered, but it is known that Governor Brumbaugh wants to carry out many governmental projects that will run the appropriations high, and also he is desirous of carrying out a comprehensive road building program. The appropriations two years ago exceeded $66,000,000.

The failure of the people to pass the $50,000,000 road bond issue in 1913 left the state with its 10,200 miles of highways on hand and only the ordinary revenues with which to build roads. Governor Brumbaugh, in his inaugural message, said it might as well be admitted that it was a mistake to take over so many miles of roads before it was certain the bond issue would be provided.

A return to a state tax on real estate would be met with considerable opposition. The Governor's views on the subject are not known as yet. But it is conceded that the state cannot lay a heavier burden upon the corporations, which now furnish most of the state's revenues. Members of the legislature here this week were of the opinion that a land tax, if levied, would provide sufficient funds for the carrying out of a comprehensive road building scheme. A state tax of ¼ or ½ of a mill on the assessed valuation of all real estate assessed for taxable purposes would bring into the treasury sufficient funds, it has been suggested. In 1913 the assessed valuation of the state's realty was $5,867,775,686 and a ¼ mill tax would raise $1,467,000.

The matter is receiving considerable thought from the members of the senate, especially, and it will be placed squarely before the Governor soon.

PENNSYLVANIA

Anthracite

Shenandoah—While five men were repairing a throttle on a high pressure steam line at the Cambridge Coal Co.'s breaker engine house on Jan. 21, a heavy steam pipe carrying 150 lb. pressure burst, catching the men in the volume of steam and scalding water, hurling them in all directions, blowing the sides out of the engine house and wrecking part of the breaker and probably fatally injuring three men.

West Pittston—Schooley shaft, that part of the Pennsylvania Coal Co. on the west side of the Susquehanna River, is rapidly being placed in shape to mine the entire output. A new washer has just been completed and this will be used to prepare the coal in the adjoining bank that it may be used for fuel for the boilers which are used there.

Shamokin—Ten inches of snow fell here on Jan. 23, blocking railroads and collieries. A number of the latter were abandoned for the day. Several hours after the snow a heavy rain started, continuing most of the day. By night there was more snow. Water flowed into a number of the mines in such quantities that a score of operations are badly flooded, and it is feared some will be idle for a lengthy period.

Wilkes-Barre—At a meeting of the Wilkes-Barre District Mining Institute, held on Jan. 21, the date for the big mining institute dinner, which will be held May 5, at Irem Temple, was announced and a committee on program for that event was named as follows: Charles Enzian, J. J. McCarthy and R. P. Thomas. The directors all agreed to visit the mining school at the Y. M. C. A. and talk to the students when they find it convenient.

Bituminous

Uniontown—Announcements were made recently by the W. J. Rainey Coke Co. of a reduction of 7 per cent. in the wages of employees. The firm thus returns to the scale of 1910. The cut affects 5000 employees at 11 plants.

Connellsville—The production of coke in the Connellsville region is now slightly over 200,000 tons per week, with shipments slightly less than the production. A considerable quantity of stock coke was recently moved out of the region, however.

The sixth annual banquet of the Keystone Mining Institute will be held Saturday evening, Feb. 6, with prominent mining men from all parts of the state attending.

On Jan. 25, 15,000 employees at the 68 plants of the H. C. Frick Coke Co. were placed at work on full time. For many months these plants have been operating four days or less per week. Officials of the company refuse to state whether the full time will continue or otherwise. The output of the company will be increased approximately 25 per cent. It is believed, however, that the officials of this firm anticipate a general revival in the coke trade within the next few weeks.

Pittsburgh—The date for the sale of the property of the Pittsburgh-Buffalo Co. has been fixed for May 27. The holdings of this firm consist of five separate mines, which will be sold separately. Foreclosure proceedings were entered against the Pittsburgh-Buffalo Co. by the Union Trust Co. some time ago, the latter firm holding mortgages on the coal property, which with accrued interest amounted to nearly $4,000,000. Stockholders of the coal company objected to the immediate sale of the holdings, claiming that this would be prejudicial to the interest of the unsecured creditors, and the court was asked to withhold the sale until a later date, as it would then be possible to secure a better price for the property

Ralphton—The output of the seven mines of the Quemahoning Coal Co. for the year 1914, in spite of the slump in the trade and other handicaps was 630,000 tons, according to the report just completed by State Mine Inspector F. W. Cunningham. Five of the company's mines are at Ralphton, one at Rockwood and one at Husband. Coal orders received thus far this year indicate that the business of the company in 1915 will be fully up to the standard.

WEST VIRGINIA

Charleston—A deal which concerns a large part of the output of the New River Coal Co. has been reported whereby the New England Coal & Coke Co. secures an important tonnage from the mines located in the New River district. This signifies that the coal company will sell a large portion of its coal, or all of that shipped to the New England states to the New England Coal & Coke Co. for a period of years. This coal has heretofore been sold under contract to the Darrow-Cann Co. of Boston. It is said that the output involved exceeds 2,000,000 tons per year.

Huntington—Earle A. Henry, chief of the State Department of Mines, has given out the information that while the business depression made large reductions in the coal production of other states, it merely retarded the growth of the industry in West Virginia. The output for the calendar year amounted to 72,800,000 short tons, while the coke produced was 1,600,000 tons, approximately 1,344,000 short tons of coal were used in the mine operations, 896,000 tons were furnished to the local trade and tenants, and 3,136,000 tons were used in coke ovens, and approximately 67,200,000 tons were shipped from the mines, at least $\frac{9}{10}$ of which went to points outside of the state. Exclusive of foremen, office employees, store clerks, etc., 78,000 men were employed in and around the mines of the state, and 5500 mules, together with 1000 horses and 1700 locomotives, were employed for haulage. During the year about 20 new mine fans were installed, 30 new tipples were constructed, 600 new mine cars were purchased, and 400 new dwellings built. Reports indicate that there were at least 100 mines closed by reason of the depression in business, while about 75 more were in early stages of development. These figures are not final, but are based on information available at the present time.

ALABAMA

Birmingham—The remaining physical property of the bankrupt Oak Leaf Coal Co. was sold a short time ago for $4643.38, and the sale approved by E. H. Dryer, referee in bankruptcy. W. G. Lunsford and J. S. Shannon, the purchasers, announce that they will organize a new company and begin operations within 30 days. It is understood that they have also obtained the land and mineral rights.

Seeking to recover the amount of commissary license alleged to have been wrongfully collected in 1911, William Bibby, a well known coal operator of Littleton, Ala., has called a meeting of all commissary owners and managers throughout the state to join in a movement to have the money refunded through the present legislature. The commissary license act was passed four years ago. Some of the larger corporations owning commissaries paid the license under protest, and as the act was later declared unconstitutional, the money was refunded. Mr. Bibby states that a great number paid the license without protest and as the money had passed out of the hands of the probate judge and had been distributed to the county and state, nothing but an act of the legislature will enable them to recover the amount of license paid, amounting approximately to $10,000.

KENTUCKY

Greenville—Muhlenberg County operators and miners for the time being are enjoying a season of good cheer, as every mine in the county is working, with almost full time prevailing. The output is being moved out as fast as it is produced. There is little definite information as to how long the activity will continue but the people of the county are making hay while the sun shines.

OHIO

Salem—J. H. Steffel, who purchased the Ely Bros. mine last October, has filed an assignment for the benefit of his creditors and appraisers have been named to value the coal property.

Columbus—J. M. Roan, Ohio chief deputy and safety commissioner of mines, in his second bulletin for the year shows the serious injury of a miner through the careless use of calcium carbide for lamps and as a result makes an order calling upon all mine bosses and superintendents to enforce the law governing the use of this illuminant. The law provides that only sufficient calcium carbide shall be taken into a mine to supply the lamp for one day and this supply shall be kept in an airtight container.

INDIANA

Indianapolis—The Indiana Public Service Commission has approved a rate of 50c. a ton for coal shipments over the Chicago & Eastern Illinois R.R., from Brazil to Indianapolis. The road is not required to readjust its rates from intermediate points. The order opens up additional fields for the Indianapolis coal supply and puts the C. & E. I. on an equal basis with the Big Four and Vandalia in hauling coal to Indianapolis.

Cannelton—The American Cannel Coal Co. has closed a contract with the municipal electric light and power plant to furnish current for operating its mines, about two miles from the city. Under the terms of the contract the expense of installing the poles and wires will be divided while the company has bound itself to use current to a minimum amount of $500 a year.

ILLINOIS

Hillsboro—Sheriff Wheeler, of Sangamon County has advertised for sale the properties of the Illinois Colliery Co., to satisfy a judgment in favor of the Pittsburgh Coal Co. This sale will be held in Springfield, Feb. 4. The property to be sold includes the Litchfield coal mine with 10 acres of surface and 225 acres of coal rights, also 11,300 acres of coal rights around Waggoner lying in Montgomery and Macoupin Counties.

Virden—Fire on Jan. 21 destroyed the engine, boiler, and dynamo rooms of the Montour Coal Co., entailing a loss of about $25,000. Two hundred and fifty miners are affected by enforced idleness.

Murphysboro—The Harrison mine of the Big Muddy Coal & Iron Co. is being dismantled after 40 years of service. This is the oldest producing mine in all southern Illinois, and at the time of its abandonment was getting out from 800 to 1000 tons per day. On account of working into the out-crop and the exhaustion of most of its acreage, the cost of production became so high that it was decided to abandon the mine. The remaining acreage will be worked from the No. 9 mine on the east side of the Big Muddy River, and tunneling is now in progress under the river bed to reach this coal, which lies at a depth of 165 ft. below the surface. Judging from the remaining acreage in the Big Muddy field, it is likely that in the next 10 or 15 years this body of coal will be entirely worked out and the field abandoned.

MINNESOTA

Warroad—Analysis of samples of coal secured while digging a well here and sent to the State University for analysis show the material to be a high grade lignite, said to be superior to that found in North Dakota. The coal measure was about 14 ft. in thickness. Although it is believed that another measure underlies the first, the present deposits are considered to be sufficient to be a paying proposition, and many people are watching the work of the well drillers.

OKLAHOMA

Alderson—The Rock Island Coal Mining Co., 139 West Van Buren St., Chicago, has sunk a new shaft at this point in the center of the Alderson coal basin and reached the well known McAlester vein of 4½-ft. thickness at a depth of approximately 804 ft. This is expected to be one of the most modern, up-to-date plants in the Southwestern coal fields, and will be equipped with steel tipple, washery, picking tables, box car loaders, and the latest equipment. A daily output of 1000 tons is planned.

Hartshorne—The Rock Island Coal Mining Co. has sunk a new shaft near here which will be known as Mine No. 10, to penetrate the Lower Hartshorne vein. This reached the coal of 4 ft. 2 in. thickness at a depth of 595 ft. A wooden tipple is temporarily being used until the underground workings are fully developed, when a steel structure will be erected. It is expected that the company will award contracts for the steel tipple and other machinery and equipment required at this new mine some time early in the spring of 1916, the permanent plant to be operated by electricity.

PERSONALS

D. H. McGee has taken charge of the Buffalo office of W. A. Stone & Co., coming from the home office at Uniontown, Penn.

The Retail Coal Dealers of Birmingham, Ala., recently met and elected the following officers for 1915: Asa L. Hoyt, president; J. E. Hawkins, vice-president; M. G. Guggenheim, secretary-treasurer.

A. D. Macfarlane, chief engineer and assistant manager for the receiver of the LaFollette Coal, Iron & Ry. Co., is on a visit for a week at Kingston, Penn., the home of his father, who is quite ill.

N. Bowland, formerly advertising manager of the Buffalo Forge Co., and more recently of the Duff Mfg. Co., has just accepted a position as advertising manager of the A. W. Byers Co., of Pittsburgh, Penn.

Edward H. Coxe, of LaFollette, Tenn., former manager of operations for the receiver of the LaFollette Coal, Iron & Ry. Co., will move to Knoxville, Tenn., Feb. 1. His address there will be "The Marion."

J. M. Page, until recently superintendent for the LaFollette Coal, Iron & Ry. Co., LaFollette, Tenn., first at Rex No. 2 mine and then at Rex No. 1 mine, is now superintendent of the Sunny Side Coal Co. in Colorado.

David Kelso and Thomas Roscoe, of Birmingham, Ala., were reappointed associate state mine inspectors for fill-in terms, by Governor O'Neal, recently. The short term will expire Apr. 27, and they must either be appointed again at that time or their successors be selected by Governor Henderson, who was inaugurated on Jan. 18.

Warner Shook, of Birmingham, Ala., has been placed in charge of the reorganization of the New Orleans Transportation Co. Failure to complete work on Lock 17 has delayed the original plans of the company, but as this work will soon be completed, the company is planning to build a fleet of barges, sufficient to handle a large tonnage of coal from the Alabama coal fields to New Orleans.

OBITUARY

Thomas Jacobs, who mined coal until after he was 77 years old, died at his home recently in Glen Carbon, Ill. His death was the occasion of the mines in that vicinity closing down for the mining fraternity to attend the funeral. This is something that isn't customary in that section, but on account of the record of over 50 years as a coal miner it was a mark of tribute.

CONSTRUCTION NEWS

Craftsville, Ky.—The Roberta Coal Co. expects to begin work looking toward a big development of the Wright coal land tract near here on the Lexington & Eastern R.R. Several hundred men will be employed from the start.

Pittsburgh, Penn.—Plans have been submitted by the Pittsburgh Coal Co., to contractors for estimates on a hoisting engine house and substation at Montour mine No. 4, located at Hill Station about six miles above Marshalsea.

Sciotoville, Ohio—The Dravo Contracting Co. is making rapid progress on the bridge spanning the Ohio River at this point, and a larger number of men will be employed within a short time. At present about 100 men are upon the work every day, including Sunday.

Henry, W. Va.—The work of reopening the mine of the Davis Coal & Coke Co., at Henry, is now well in hand, the water being well pumped out of the shaft. There will also be built at this place during the spring, 26 houses to be occupied by miners and other employees.

Huntington, W. Va.—Unless some unforeseen contingency arises, the new operations of the Maher-Purseglove Co. will start shortly. The tract of land to be developed is located 10 miles from Logan on Island Creek. Work preliminary to the starting of the operation is being rushed.

Whitesburg, Ky.—G. W. Hopkins and others, of Glamorgan, Va., are leasing the E. M. Webb coal land tract at Sergent, on the Lexington & Eastern R.R., and will put in a coal mining plant, beginning within 30 days. They expect a daily capacity of 800 tons from the beginning.

Prestonsburg, Ky.—The Alum Creek Block Coal Co., recently organized at Ashland, has leased a 1000-acre coal land tract at Alum Creek, near here, and will begin development at once. The company will employ several hundred men for the initial work. This development will be on the Big Sandy branch of the Chesapeake & Ohio R.R.

Jellico, Tenn.—The work of surveying for the Jellico, Cappachine & Western Ry., has been begun in the Jellico mountains. This road is to be about 30 miles in length, and will be constructed for the purpose of opening the coal and timber fields lying in the mountain country west of this city. It is believed that grading will be started within a short time.

Penny, Ky.—The Penny Coal Co., beginning Feb. 1, will put 200 men to work building miners' houses and opening additional mines. It began the shipping of coal a few days ago. L. B. Abbott, formerly with the Consolidation Coal Co., is manager of the new operations. The development is on the Sandy Valley & Elkhorn branch of the Baltimore & Ohio.

Steubenville, Ohio—It is reported that the West Virginia-Pittsburgh Coal Co. will open a new mine on the Wabash R.R., in the Cross Creek district of Brooke County, W. Va. It is said that two large turbine engines will be installed at the new operation. Further that this firm intends to establish a boat yard in Wellsburg, and will manufacture and repair river barges.

Colliers, W. Va.—The new houses started some time ago at the Locust Grove mine of the West Virginia-Pittsburgh Coal Co. a short distance above Colliers, were completed recently, and were occupied at once by employees. All available houses at this operation are now occupied with the exception of one which was only recently vacated. The new car shops being constructed at this mine will be completed within a short time.

Mater, Ky.—The South East Coal Co., a subsidiary of the Slemp Consolidated Coal Co., is starting the preliminary work on a coal mining plant about midway between Mater and Fleming on the Lexington & Eastern branch of the Louisville & Nashville R.R. in the Boone's Fork coal field. The company proposes a good sized development, and will start work at once building miners' houses, coal tipples, doing grade work, etc.

Garrett, Ky.—The Ambursen company has about completed the installation of a Lawson automatic tramway for the Elk Horn Mining Corporation at one of its mines. The tramway takes the slate from the tipple in the bottom of the valley, carries it a distance of about 1000 ft. up the mountain back of the tipple to an elevation of 320 ft. and automatically dumps it into the valley beyond where there is abundant room. The capacity of the tramway is 20 tons per hour.

NEW INCORPORATIONS

Youngstown, Ohio—The Western Reserve Mining Co. has filed amended articles of incorporation reducing its capital stock from $100,000 to $15,000.

Coalmount, Ky.—The Watts Creek Coal Co. has been organized with a capital stock of $10,000. The incorporators are W. L. Moore, M. M. Stanaford, F. S. Lawson and E. L. Stephens.

Chicago, Ill.—The Black Star Coal Co. has been organized with a capital of $100,000 to operate coal mines, gas and oil wells. The incorporators are Frank E. Doherty, John T. O'Connor, and Albert G. Miller.

Columbus, Ohio—Papers have been filed with the secretary of state changing the name of the Whyel Coal Co. of Columbus to the Sunfish Creek Coal Co. This firm holds a large acreage in Morgan County which will be developed.

Lexington, Ky.—Amended articles of incorporation increasing the amount of indebtedness that may be incurred by the Lexington & Eastern Ry. from $10,000,000 to $20,000,000 have been filed in the county clerk's office here. W. A. McDowell, Younger Alexander, Charles N. Manning and Samuel M. Wilson, directors of the company, signed the paper.

Martins Ferry, Ohio—An application has been sent to the Secretary of State for a charter for a new coal corporation to be called the Maher-Purseglove Co. The stockholders of this corporation are the same as those composing the Purseglove-Maher Coal Co. The new firm will operate the mines which will be opened in the Logan field of West Virginia.

McKeesport, Penn.—A charter has been granted to the Allegheny Byproduct Co., with a capitalization of $350,000; extensive repairs and improvements are now being made to the plant at Otto and within 60 days it is said that work will be started to its fullest capacity. About 225 men will be given employment, approximately one third of whom will be skilled workmen.

Blairsville, Penn.—A charter of incorporation has been granted to the Bradenville Coal & Coke Co., presaging an important change in local mining circles, involving the transfer of the Duquesne plant of the Bessemer Coal & Coke Co. to the Graff interests of Blairsville. It is said that the sale of this plant has been pending for several weeks and its consummation in the near future is believed to be assured provided the survey of the coal proves satisfactory to the purchasers.

INDUSTRIAL NEWS

Hazard, Ky.—Williams & Wilson are reported to have leased 1000 acres of coal land for development.

Birmingham, Ala.—The Edgewater mine of the Tennessee Coal & Iron Co. produced last year the largest tonnage of any mine in the state—716,000 tons. This was in excess of any other two mines in the commonwealth.

LaFollette, Tenn.—The bankruptcy case of the Electric Corporation, of Boston, Mass., against the LaFollette Coal, Iron & Ry. Co., which was to have been tried in the Federal Court at Knoxville, Tenn., on Jan. 19, has been again postponed.

Toledo, Ohio—The Lee J. Sandridge Coal Co. will establish a general office in Toledo. This will be in charge of S. M. Stanley, formerly of Chicago, who has been appointed general western agent of the company. This firm mines and markets Meriden smokeless coal.

Washington, D. C.—Proposed increased joint rates over the Mobile & Ohio R.R., on coal from mines in Alabama, Illinois, Kentucky and Tennessee, to Memphis and other points which were to become effective Feb. 1, were suspended Jan. 22 until Apr. 30 by the Interstate Commerce Commission, pending investigation.

Chattanooga, Tenn.—Heirs of William Clift have instituted suit in the Chancery Court of Hamilton County against the New Soddy Coal Co. seeking to recover between $150,000 and $200,000 in royalties. A hearing of the case before A. W. Gaines, special commissioner, recently began. The suit is based on a lease of 11,000 acres of land by the coal company under date of 1901.

Alliance, Ohio—J. H. Steffel, of Salem, who purchased the Ely Bros. coal mine, west of Alliance, last October, has made an assignment to J. P. Davis for the benefit of his creditors. G. Thomas, J. Ashman and J. T. Reese, have been appointed as appraisers. After they have completed their work the mines will be sold to settle up affairs. Mr. Steffel claims assets double the amount of liabilities.

Toledo, Ohio—The convention of the Michigan, Ohio, Indiana Coal Association will be held at Cedar Point in June. The exact date of the convention will be announced by President H. H. Beam. Last summer the convention was held at Indianapolis. Officers reported the association in excellent condition and that the number of claims and collections handled by it had doubled during the last year.

Milwaukee, Wis.—The Manierre loader, designed to load lump and sized coal into boxcars, has been adapted to load soda ash by the Solvay Process & Michigan Alkali Co. Soda ash is about the consistency of table salt, and is very dusty. The company, which had tried many loaders of its own unsuccessfully, was skeptical about the Manierre. The Manierre Engineering & Machinery Co. guaranteed the first loader it installed. It was successful and now three are at work.

San Francisco, Calif.—In its fight for a new trial before the Federal circuit court of appeals the Western Fuel Co. has filed a bill of exceptions. The officers convicted and sentenced in the original trial were James B. Smith, vice-president; Edward Mayer, a weigher; and Fred C. Mills, superintendent. Smith and Mayer were sentenced to San Quentin for 18 months while Mills received a county jail sentence of one year. None of the convicted officers have yet begun to serve their sentences.

Greenville, Ky.—Returning five new indictments growing out of investigations into the "possum hunter" depredations of the last few months the Muhlenberg County grand jury has adjourned, having brought in a total of 36 indictments. Owing to conditions of roads and weather the several investigations were allowed to go over to the next term of court. The case involving alleged intimidation of employees of the Bevier Coal Co. will probably be heard on a change of venue from Muhlenberg County.

Pittsburgh, Penn.—The demand for coke among founders is growing, this change being particularly noticeable during the recent past. For more than two years founders have been using less coke than for many seasons previously. It is stated, however, that orders have been coming in more freely of late. Some good contracts have been closed, and in nearly all cases the buyers have insisted on a contract specification that will enable them to call for larger quantities at the same price for the contract period.

Pittsburgh, Penn.—In the United States District Court on Jan. 21, W. W. Keefer, of Pittsburgh, and F. M. Wallace, of Erie, Penn., were appointed joint receivers with D. W. Kuhn, for the Pittsburgh-Westmoreland Coal Co. Keefer and Wallace take the place of the Fidelity Title and Trust Co., whose resignation as receiver was accepted by Judge Orr. The Fidelity company also filed its report, which showed that the coal company was earning money and that it has paid off several bonds with money from the sinking fund.

Uniontown, Penn.—The appointment of receivers for J. V. Thompson was not entirely unexpected even some time ago, and was obviously a necessity when the bank of which he was president was closed. The proceedings thus far are friendly, and hopes are entertained that the complicated task of arranging matters will remain in friendly hands under the supervision of Mr. Thompson himself. The opinion in disinterested quarters is that heavy losses would follow a legal contest between the different parties in interest.

Sandusky, Ohio—Official figures on the coal shipments handled at the Pennsylvania R.R.'s docks here, just made public, indicate that the tonnage handled last year was not materially below that of 1913, in spite of the general falling off in Lake shipments. The business at these docks for 1914 was only 85,000 tons less than that of 1913, the total being 2,533,250 tons for 1914, as compared with 2,618,250 for the former year. This business represents 53,982 carloads of coal, while 543 vessels took cargoes from the docks for Lake ports.

Wilmington, Del.—Alleging that the Elliott-Chapman Coal & Coke Co., of Gaston, Ala., a Delaware corporation now in bankruptcy failed to comply with certain requirements of the Alabama law imposed upon foreign corporations, a meeting of creditors opposed the allowance of claims of certain Alabama creditors holding that the alleged failure of the company to do certain things required by the Alabama law invalidated these claims, which were for supplies, material, etc. The point will be argued before Referee Wales on Feb. 3.

Charleston, W. Va.—The statement of shipments of coal and coke over the lines of the Chesapeake & Ohio Ry. during the month of November and 11 months of the year 1914, shows that 1,568,002 tons of coal and coke were shipped over the line during the month of November, as compared with the shipment of 1,558,521 tons for the same month of 1913, or an increase of 9481 tons. For the 11 months of the year, 19,465,505 tons were shipped, as against 16,018,039 tons for the corresponding period of the previous year. This revealed an increase of 3,447,466 tons over the 11 months of the previous year.

Whitesburgh, Ky.—There is much speculation in railroad circles here regarding the prospective race between the Louisville & Nashville and the Baltimore & Ohio for territory in the Rockhouse Creek section in Letcher County. It is known that the B. & O. a few days ago secured $5,000,000 by mortgage with which to make the extension, and about the same time the L. & E. branch of the L. &. N. made arrangements to increase its indebtedness to $20,000,000 instead of $10,000,000. Both railroads have engineers in the field locating lines, and those in a position to know say there will be "something doing" in the coal fields ere the ides of March. It is believed that both roads will build through Rockhouse Creek.

Pittsburgh, Penn.—That officers of the Bank of Pittsburgh had attempted to force foreclosure proceedings and the sale of the $14,000,000 properties of the Four States Coal & Coke Co. a subsidiary of the Pittsburgh-Buffalo Co., was the charge made at a meeting of the stockholders of that firm held on Jan. 23. It was alleged that bank officials had flatly refused to agree to any reorganization plan that would not contemplate wiping out all the common stock interest and also that of preferred stockholders, the owners of which had refused to contribute to the expenses of reorganization. The stock of the coal company is largely held in small allotments by men employed by the Pittsburgh-Buffalo Co. and its various subsidiaries.

Cleveland, Ohio—Business depression and the miners' strike were the grounds on which a receivership was granted for the Card & Prosser Coal Co. recently by Judge Pearson. The application was made by the Union National Bank, which holds a judgment of $10,900 against the coal company. C. T. Brooks was named as receiver. The company was capitalized at $150,000 and the petition in bankruptcy asked that the receiver be given authority to carry on the business of the firm. It is stated that owing to the present coal strike, it is impossible to operate the mines owned by the company in and about Lisbon, Ohio. The depression in the furnace business at present has also operated against the company. It is impossible for the firm to make a profit until conditions improve.

Coal Trade Reviews

General Review

Large accumulations of anthracite and prices are weakening. Bituminous output rigidly curtailed but still in excess of market requirements. The expected improvement in the industrial consumption has failed to materialize.

Large surpluses of anthracite are noted in all directions, and unless there is some unusually severe weather there is little prospect of the trade righting itself before the close of the season. The market is distinctly flat with operations heavily curtailed, and the independents slashing the company circulars. Accumulations are large, particularly in the hands of the dealers, and it will take more than a slight cold snap to develop any important buying movement.

The spot bituminous market is absolutely flat. Accumulations are large at all the distributing centers while mining operations have been cut down to about 60% of the running schedules in effect a year ago; but, in spite of this heavy curtailment, shippers are exceedingly hard pressed to find a disposal for their product. A spectacular advance in ocean freights to New England points threatens to develop complications as regards the Hampton Roads coals in the Down East markets, and Pennsylvania operators are watching closely for an opportunity to broaden their activities in that direction. At the moment the movement is confined entirely to contracts, and the outlook for the future hinges largely on weather conditions.

A slight broadening of the market is noted in the Pittsburgh district due partially to the stormy weather and to a very light increase in operations at the steel mills and on the railroads. There is scarcely any renewing of old contracts. If the situation does not take a turn for the better shortly, operators are beginning to fear that negotiations on new contracts will open at a low level. Sacrifice prices are becoming more frequent in Ohio, and the effects of the long continued pressure under which the market has been laboring are becoming acutely evident. The domestic trade stiffened up somewhat as a result of the heavy snow storms and lower temperatures, but prices continue unchanged and the outlook for the steam grades is as uniformly discouraging as ever, with consumers showing a distinct tendency to hold off in closing.

The steam coals are somewhat steadier in the Southern market, but the domestic grades continue heavy, and a great deal is accumulating on track awaiting disposal. Mine operations are at about half capacity. Middle Western dealers are apparently loaded up to full capacity, and in spite of the extremely cold weather and heavy snows, the trade is remarkably apathetic with prices showing a distinctly weakening tendency. The situation is being further aggravated by poor collections both retail and wholesale, and operations are rigidly curtailed in all fields.

ATLANTIC SEABOARD

BOSTON

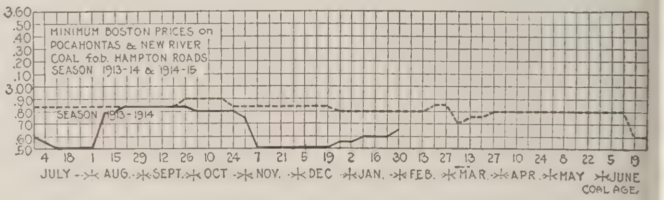
Sharp rise in water freights a new factor in outlook. Less talk of contracts and bulk of coal may this year be sold f.o.b. where prices continue about the same. Georges Creek shippers well supplied with orders. Pennsylvania grades may have much better outlet all-rail. Anthracite still dull.

Bituminous—Prices f.o.b. Hampton Roads seem no firmer than last week. Coal is coming down in ample volume, and is in fact beginning to again accumulate in a large way. Some of the agencies controlling their own transportation are understood to have closed some season contracts on a delivered basis, but it is probable that from now on, at least until the situation clears, what contracts are made will be on an f.o.b. basis. Buying will not be very free on such a program and a further period of reduced tonnages and dull trade is the outlook for Pocahontas and New River.

The flurry in freights stimulated spot business for a few days but there is now a disposition not to take on coal except as matter of necessity, lest buyers further bid up vessel terms. On-car prices have stiffened in response to conditions along the Seaboard.

The larger shippers of Georges Creek are apparently waiting until they are caught up with orders before they announce a policy with regard to delivered prices. A large proportion of their Tidewater coal is placed in bottoms which they control and it will be interesting to watch developments in that direction. As it looks now, if they name prices at all within reason, they will probably be able to gather in all the business they want.

The outlook is decidedly interesting for operators in Pennsylvania. There is an amount of anthracite-carrying transportation at their disposal but the more promising phase is the broader outlet for these coals all-rail to New England points that are normally reached from rehandling plants at Tidewater. There are mill centers where the Tidewater delivered price cannot be raised too high without throwing the business to Pennsylvania mines for delivery all-rail. Shippers of the better known grades are already actively canvassing for business of this kind.



Water Freights are now $1@1.10, Hampton Roads to Boston on large vessels. Several additional schooners have been chartered on a monthly basis off-shore and it is extremely difficult to secure an option on Coastwise boats even for a single trip, so excited are transportation owners over inquiries for over-sea tonnage. Rates from the Chesapeake advanced 25c. within a few days; $10 is rumored to have been paid a sailing vessel to Buenos Aires.

Anthracite continues very dull for the season. All sizes are in easy supply, but the demand is still very light. Dealers are cautious about buying; with the mild weather that still prevails they feel the backbone of winter is about broken. The Boston retailers advanced prices, however, Jan. 19, 25c. on broken, stove, and chestnut, making current prices $7.75 for egg, $8 for stove, and $8.25 for chestnut. The move was more to restore the basis of a year ago than because of any extra demand for fuel.

Wholesale prices on bituminous are about as follows:

	Clearfields	Cambrias Somersets	Georges Creek	Pocahontas New River
Mines*	$0.90@1.50	$1.15@1.65	$1.67@1.77	
Philadelphia*	2.15@2.75	2.40@2.90	2.92@3.02	
New York*	2.45@3.05	2.70@3.20	3.22@3.32	
Baltimore*	....	....	2.85@2.95	
Hampton Roads*	....	....	....	$2.65@2.75
Boston†	....	....	....	3.78@3.83
Providence†	....	....	....	3.73@3.78

* F.o.b. †On cars.

NEW YORK

Bituminous slowing up still further and the outlook is discouraging. Anthracite situation also becoming worse. Conditions hinging almost entirely on the weather.

Bituminous—The local soft-coal market has seldom ever been so completely flat. Mines as a rule are only producing about 60% of the January output last year. Some slight improvement is noted in railroad circles, though it is so small as to be practically negligible, and it is clear that agencies are crowded for business. In spite of the great activity in shipping, the bunkering trade does not seem so good at the moment, though this business fluctuates to such an extreme that this cannot be regarded as a reliable criterion of the situation.

Negotiations on expiring contracts are now engaging the attention of the sales agencies, and the situation is beginning to shape up. So far operators have apparently succeeded in closing on the same basis as last year. Whether these prices will be held throughout the season depends largely on developments over the next 30 to 60 days.

There are persistent rumors to the effect that the Berwind company is beginning to take active steps toward building up a market in the line trade. It is clear that some disposal must be found for their tonnage, and it is only logical to expect such a move. It is stated that their mine operations have been increased recently.

The New York market is quotable on approximately the same basis as follows: West Virginia steam, $2.35@2.55; fair grades, Pennsylvania, $2.55@2.65; good grades of Pennsylvania, $2.70@2.80; best Miller Pennsylvania, $3.10@3.15; Georges Creek, $3.15@3.25.

Anthracite—The hard-coal trade has been slowing down to such an extent that complaints are becoming almost as general as in bituminous. Practically all sizes are in easy supply, with the possible exception of Nos. 2 and 3 buckwheat, though plenty of these can be had without any great difficulty.

Unless there is a decided change for the better, it is becoming clear that the large companies are going to carry over large stocks into the summer business. This probably means that this coal will be carried through next winter also, since the companies will no doubt stock heavily against the possibility of a long suspension when the wage agreement expires, a year from next April. The independents are cutting the circular in all directions, and there is only the thinnest pretense of obtaining circular prices.

Restrictions in buying, indicating an economy in consumption, is the feature of the anthracite trade this season. The question of credits is also being more carefully considered. Where sales agents have heretofore allowed consumers long-term payments, this is now being refused with the result that the purchaser is restricting his current requirements to the lowest possible minimum.

The market is quotable as follows:

	Upper Ports		Lower Ports	
	Circular	Individual	Circular	Individual
Broken	$5.10	$4.60@5.10	$5.05	$4.55@5.05
Egg	5.35	5.10@5.35	5.30	4.80@5.30
Stove	5.35	5.20@5.35	5 30	5.15@5.30
Chestnut	5.60	5.45@5.60	5.55	5.30@5.55
Pea	3.55	3 45@3.55	3.50	3.35@3.50
Buckwheat	2.80	2.70@2.80	2.50@2.75	2.35@2.75
Rice	2.30	2.25@2.30	2.00@2.25	1.80@2.25
Barley	1.80	1.70@1.80	1.75	1.35@1.75

BUFFALO

Still quiet in both anthracite and bituminous. Resumption of wintry weather will help some, but bituminous is reported to be in large surplus Westward. Large amount of anthracite going into Lake vessels.

Bituminous—There is but a small improvement in the trade; some shippers do not see any, and the fear is now that spring prices will have to be lower than they were last spring. This leaves the shipper with the option of tying himself up for a year on low-priced contracts, with the possibility of an active market shortly. There are reports current that there are likely to be 2,000,000 tons of bituminous on the Upper Lake docks when navigation opens in the spring. This is quite different from the report of a few weeks ago, which made it appear that coal was selling so fast Westward that there was likely to be a shortage.

There is not much doing yet in bituminous contracts. The price of bituminous is still rather weak at regular base quotations, $2.80 for Pittsburgh lump, $2.70 for three-quarter, $2.55 for mine-run and $2.15 for slack, with slack somewhat stronger than sizes, but not so scarce as it was a month ago. Allegheny Valley prices remain at 25c. lower than Pittsburgh. There is talk of not giving out these base prices from Pittsburgh this year, partly because it is so difficult in late years to adhere to them and partly because as it looks now they will have to be lowered, which nobody likes to do.

Anthracite—The demand is not strong, even for the time of the year when the first fall clamor is supposed to be past; it is sure to improve with colder weather, though it appears that the consumer has rather more coal on hand than is the rule at this time of the year. Shippers say that when the demand becomes slack in midwinter it is a hard matter to start it up again. The demand for egg is stronger than for stove, with chestnut leading much as it used to before the additional price was put on. All small sizes are quiet, some local dealers offering everything from pea down at a discount.

Coal is still going into Lake vessels on winter storage, though tonnage is hard to get and heavy freezing will make it still more scarce. Shippers who have not taken any tonnage yet are now in the market, so that it looks as if there would be a large fleet ready to move as soon as the Lake season opens.

PHILADELPHIA

General indifference among anthracite consumers. Curtailment still found necessary. All sizes in easy supply. Depressing conditions in bituminous again prevalent.

Anthracite—While this section of the country has been visited with fairly good coal burning weather, the stocks of the dealers are so large that they are in splendid shape to take care of any spasmodic demand that may take place. There is likely to be no active demand at all the balance of the winter, unless there be some exceedingly heavy weather. It will require weeks of low temperatures to create anything like an active market, in the face of the weak condition that now characterizes the trade. Concessions on stove coal are being made by the individual operators in order to move their output, and it is understood that it is commencing to accumulate on the large companies.

The month of January has been a distinct disappointment. It was the general feeling in the trade at the inception of the new year, that the surplus had about been absorbed and the market would support continuous operations at the mines until at least the middle or latter part of February, but such has not been the case. Outside of buckwheat, for which there is more of a sustained call than any of the other steam sizes, the market is distinctly flat, and 50% operations are the rule. Chestnut seems to be in even better shape than stove, just at the present time, although all domestic sizes are inclined to drag.

Prices at Tidewater rule about as follows:

	Circular	Individuals
Broken	$4.75	$4.50
Egg	5.00	4.80@4.90
Stove	5.00	4.90@5.00
Chestnut	5.25	5.00@5.10

Bituminous—The prospective improvement anticipated some two or three weeks ago, has resolved itself into another depressing period. The market at that time showed a marked tendency toward better demand and higher prices, but this has now disappeared. There is still a slight shortage of the Georges Creek coals at Tidewater, but it is understood that sufficient is coming forward to relieve this situation.

BALTIMORE

Warm weather has hurt the trade severely. Coastwise and foreign movement comparatively light.

The week just closed has been a poor one for both the hard and soft-coal business. The temperatures were so high that there was a distinct falling off in the demand for domestic coals. Smaller sizes of anthracite were especial sufferers.

Gas and slack of West Virginia showed particular weakness. The best three-quarter was freely offered at 85c. a ton, while slack sold around 65c. to the trade. West Virginia steam coals of low grade sold at 80c., while select qualities were offering at $1.15 to $1.20. High-grade Pennsylvania coals were selling at $1.25 at the mines to the trade, and ordinary grades at from 95c. to $1.05.

Coastwise movement and foreign business are quite flat as compared with several weeks ago. Italy and Cuba are taking most of the export coal now moving from this port.

While business here just now is most unattractive there are signs of better times ahead. The Maryland Steel Co. has secured contracts to build four large steamships, assuring more activity at that plant. The Consolidation Coal Co. is preparing to float $7,000,000 in bonds for extensions to increase its coal output. The Davis Coal & Coke Co. interests have also announced a financial plan to practically double the output of the mines of that concern.

OCEAN FREIGHTS

Rates still continue their spectacular advance and charters are very difficult to negotiate.

The freight market continues to advance. Owing to the very high rates now offered on sugar from Cuba, it is becoming extremely difficult to secure steamers for coal outward to Cuban or West Indian ports, as owners of the few available steamers state that it pays them better to send them in ballast.

Early last week the British steamer "Auchencrag," about 6000 tons cargo, was chartered in London to load coal at Baltimore for the Plate at $9.60. Numerous boats were offering here for the same voyage at $9 at which rate they are still being offered.

The market is hardly quotable, but approximate prices may be taken as follows:

To	Rate	To	Rate
Havana	**$2 50**	Guantanamo	**$3.00**
Cardenas or Sagua	**3 00**	Demerara	**5 00**
Cienfuegos	**3 00**	Bermuda	3.50@4.00
Port of Spain, Trinidad	**3.25**	Vera Cruz	**3.00**
St. Lucia	3.00@3.25	Tampico	**3.00**
St. Thomas	**3 00**	Rio	**9.60**
Barbados	**3 00**	Montevideo, Buenos Aires or La Plata	**9 00**
Kingston	**3 00**	Mediterranean	**9.60**
Curacao	**2 75**	Valparaiso	7.20@7.50
Santiago	**3 00**		

W. W. Battie & Co.'s Coal Trade Freight Report.

Note—Rates noted in **bold face** type are only approximate.

HAMPTON ROADS

Shipments for week about fair. Export movement poor. Bunker requirements about the average.

Dumpings over the Tidewater piers during the past week have not been as large as expected. Several of the large coasting steamers have been taken off this trade and placed in the general cargo service and a large percentage of the coal moving has been taken care of by sail or barges. The export movement has also been less than the standard. There have been quite a number of foreign vessels in port but they have been calling principally for bunker supply. Of the export coal shipped during the week the greater part has gone to Panama, at least three steamers having been loaded for this port during the week. There has also been some movement to St. Lucia and Italian ports.

Prices are being held at circular but with the large accumulation now at Tidewater it is quite likely that some of the shippers having coal on demurrage will be making some slight cut and it is not believed that even this will create a demand. The general opinion seems to be, however, that market conditions will improve greatly during the coming week.

The bulk of the shipments made during past week has been contract business. Although the accumulation of coal is somewhat above normal, shipments are being made continually from the storage plant at Sewalls Point.

OCEAN CHARTERS

Coal charters have been reported by the "Journal of Commerce" as follows:

Vessel	Nationality	From	To	Tons	Rate
Vinland	Norwegian	Norfolk	Manzanillo	661	
	Norwegian	Virginia	Bermuda		$4.00
Ellen Little		Virginia	Bermuda	807	
Tottenham	British	Philadelphia	Tampico	1998	
Norrbotten	Swedish	Philadelphia	Narvik	3691	
Beacon	Norwegian	Baltimore	Guantanamo	715	2.75
Elizabeth Gilbert		Norfolk	Porto Cabello	482	

Note—Steamers are indicated by **bold face** type, all others being schooners.

OHIO VALLEY

PITTSBURGH

Demand slightly increased all along the line, with mines operating at about 55% of capacity. A twelvemonth contract at $1.25 for ¾-in. coal.

The coal market has shown some further improvement, more important in the fact that it is well distributed than on account of there being any abnormal increase in any particular direction. The domestic demand has been broader, owing to weather conditions, but is still not normal for the season. Demand from manufacturers has shown a slight further increase, particularly in the steel industry, where mill operations have been increasing a very few per cent. per week since the end of December. Railroad demand shows only a very slight increase. A particularly gratifying item to the local coal trade is that a byproduct coke interest in the Northwest has bought some 50,000 tons for quick shipment. Normally this interest depends on lake shipments, taking relatively little during the winter by the all-rail route.

As indicated in previous reports, regular contract business is very light, and contracts for a twelvemonth period are the exception rather than the rule. One such contract, however, for a few carloads a week, has just been closed direct with a consumer at $1.25 for ¾-in. If this were taken to mean that the seller would have given the dealer the usual trimming if the transaction had been made through a dealer the price would be rather a low one; otherwise it may be taken as about representing the market. We quote, subject to some shading for prompt lots, except in the case of slack: Slack, 90c.@$1; nut and slack, $1.05; nut, $1.10; mine-run, $1.15; ¾-in., $1.25; 1¼-in., $1.35, per net ton at mine, Pittsburgh district. The mines are operating at about 55% of capacity, taking the district as a whole.

TOLEDO

Demand only fair. Miners' strike will not affect the local situation. Prices rather weak.

There is little if any change in the coal situation here. The domestic demand is quite low and the steam trade only slightly better. It is believed by all that a really cold spell will result in a heavy run of orders both domestic and steam. The snow has caused no apparent congestion of railroads which has generally been the result of storms in Toledo.

Owing to the slow demand prices have not strengthened although they are holding fairly close to the list. It is not believed that the strike of the miners in this state will make any difference with the general coal situation here. The West Virginia and Kentucky mines make up the shortage easily.

COLUMBUS

A snow storm has caused a firmer tone in the domestic trade. Steam business is still quiet and there is little hope for the future.

Colder weather followed by a heavy fall of snow has stiffened up the local domestic trade and there has been a rush of orders from retailers. Buying was general from all of the territory which looks to Ohio for its coal supply and requests for immediate shipment were frequent.

Prices were not advanced under the better buying but a continuation of present conditions might help in the way of quotations. Retail prices are still firm and there are no signs of a decline. Pocahontas is one of the favorite varieties as well as the West Virginia splints. Hocking lump is selling for $3.50 while there is also a good demand for anthracite.

Production during the past week has not increased to any extent. The Hocking Valley produced about 65% of the average while other fields such as Crooksville, Cambridge and Jackson produced about 50%. Reports from Pomeroy Bend show that the output during the week was about 85% of normal.

Little is doing in the steam trade. Buying on the part of manufacturing establishments is slow and the outlook is not very promising. A considerable amount of the buying for steam use is on the open market. Contracting is slow and many of the users are not renewing their contracts as they expire. One of the best features is the better demand from railroads which appear to have a larger freight movement.

The coke trade is slow in sympathy with steam business.

Prices in the Ohio fields are:

	Hocking Valley	Pomeroy	Kanawha
Rescreened lump	$1.50	$1.60	.....
Inch and a quarter	1.45	1.50	$1.45
Three-quarter inch	1.35	1.40	1.35
Nut	1.15	1.25	1.15
Mine-run	1.10	1.15	1.10
Nut, pea and slack	0.70	0.75	0.65
Coarse slack	0.60	0.65	0.55

CLEVELAND

Light receipts, demurrage and small demand continue to keep the spot market from advancing. Small amount on consignment. Stocks at Upper Lake docks heavy.

A heavy snow storm over Sunday delayed coal in transit and receipts the first of the week amounted to only about 250 cars or half the usual Monday tonnage. It is not expected much coal will arrive here during the next few days, but the inquiry is not broad enough to make the market brisk. The weather increased the demand for slack, but prices were not advanced.

Three-quarter inch coal from West Virginia, including Fairmont gas, was sold at $1.65 on track here Monday; this was brought in on consignment and was under car service. Fairmont coal netted less than 45c. a ton after paying brokerage. There are only about thirty cars of consignment coal left on the market, twenty-five of which are from West Virginia No. 8 mines. Spot slack sold the first of the week at $1.70 for the best grades. Less desirable kinds sold down to $1.60.

The outlook for an early Lake season is none too bright. Upper Lake docks report a slow movement of steam coals and a fair movement of domestic grades. Duluth-Superior docks, Jan. 15, held 7,000,000 tons of coal and were shipping 24,000 tons a day. The brokers who made the report estimated the stocks on Apr. 15 will amount to 4,000,000 tons as compared with 2,000,000 tons Apr. 15, 1914.

The Lorain Coal & Dock Co. and the Pursglove Maher Coal Co. expect to have properties in the Island Creek, West Virginia district shipping Lake coal and to be able to take care of their lake trade with West Virginia coal of their own mining even if No. 8 field is not working when the season opens. Heretofore these companies have been dependent upon No. 8 for all of their coal.

Quotations for shipment are as follows:

	Pocahontas	Youghiogheny	Bergholz	Fairmont	W. Va. No. 8
Lump	$3.60	......	......	......	......
Lump, 6 in.	......	......	$2.35	......	......
Lump, 1½ in.	......	......	2.20	$1.95	......
Lump, 1¼ in.	......	$2.35	......	......	......
Lump, ¾ in.	......	2.25	2.10	1.90	$2.05
Egg	3.60	......	......	......	......
Egg, 6 in.	......	......	2.00	......	......
Mine run	2.60	2.15	1.90	1.85	1.95
Slack	......	1.80	1.75	1.70	1.75

CINCINNATI

The persistent pressure on the market has resulted i lower prices. The amount of distress coal increasing in spit of colder weather. Retailers are doing well, but larger buying has not developed.

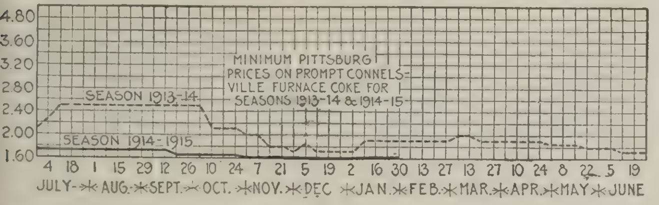
The retailers have experienced the active business whic is the usual accompaniment of wintry weather, but the whole sale market is suffering from the relative slowness in manufacturing lines. Wholesalers and operators' agents find it next to impossible to take care of their outputs, especially in the steam grades, and the effect of this condition has made itself felt in poor prices. Sacrifice prices are commoner than at any time since early December, as the trade is beginning to feel discouraged over the failure of the market to improve, though it is still hoped that the long-expected revival will develop before long.

COKE

CONNELLSVILLE

More receiverships at Uniontown, and no progress toward untangling the Thompson involvement. Prompt furnace coke a shade easier. Production and shipments slightly decreased, but prospects for consumption improved.

Following the closing of the First National Bank of Uniontown Monday of last week and the receivership the following day for Josiah V. Thompson, the famous dealer in Greene County and other coking coal acreage, as reported a week ago, receiverships have been thick in the Fayette County court at Uniontown, and there will probably be others. Mr. Thompson and the majority of his associates are now in the hands of receivers, and at least one coke company, the Tower Hill Connellsville Coke Co., has gone the same route. Mr. Thompson has been endeavoring to straighten matters out, even at a great personal sacrifice, by disposing of a large part of his holdings to capitalists, or to the United States Steel Corporation, but apparently without definite progress thus far. There is a rumor that the steel corporation has offered $18,000,000 for the aggregation. This would, of course, be unacceptable as in the legal papers leading to the receiver Mr. Thompson put his liabilities at $22,000,000 and his assets at $70,000,000.



While the situation is of the most serious moment to holders of coking coal acreage the effect on the coke market s hardly likely to be noticeable, as prices were down close to the cost of production, based on a very low rating for the coal in the ground, and sales of late have been chiefly by strong concerns with little bonded or other indebtedness. Prompt furnace coke has softened about 5c. a ton, while t is reported that $1.60 has been paid for delivery over 30 days. There is no doubt that coke could be bought for de-ivery to Apr. 1 at $1.60, while there is no regular contract market, $1.75 being quotable as nominal, based on sales some time ago. Prompt foundry is $2@2.20 and contract foundry $2.10@2.25, per net ton at oven.

The "Courier" reports production in the Connellsville and ower Connellsville region in the week ended Jan. 16 at 206,650 tons, a decrease of 2752 tons, and shipments at 204,398 ons, a decrease of 12,490 tons. The Carnegie Steel Co. has blown in five additional furnaces within the past week and has used up 21,000 tons from its stock of pig iron, so that he trend seems to be toward increased coke consumption on he part of the steel interests if not by the merchant furnaces.

Buffalo—The demand for coke does not improve. So far as the reports from jobbers go there is no stir in sight and none expected at present. There must be a decided increase n furnace operations before there is need of more coke. Prices remain weak on the basis of $4.25 for best 72-hr. Connellsille foundry and $3.30 for stock coke.

Baltimore—Coke remains an unattractive feature. Connellsville foundry was held at $2.25 and furnace at $1.75. West Virginia foundry sold at $2 and furnace at $1.50.

Columbus, Ohio—The coke trade is slow in sympathy with he steam business.

Birmingham—There is some contract business in foundry oke, but the tonnage is not large. Until conditions improve nd foundries resume full operations, no increase is expected.

Chicago—In a general way it may be said that the Chicago oke market is weak. There is a considerable volume of coke eported to be moving, and prices of domestic grades have shown wide fluctuations. Consignment coke has been sold at heavy cuts on the list prices. Prices are as follows: By-product, $4.60@4.95; Connellsville, $4.60@4.80; Wise County 72-hr. (select), $4.60@4.75; gas coke, $4.00@4.25.

THE STEEL INDUSTRY

Situation continues unsatisfactory though there appear to be more resumptions. Some large rail orders are appearing.

On the whole the reports from works give rather a better account of the steel trade than current sales. But it is to be noted that mills have been shutting down and resuming, and that only the resumptions get publicity. The Steel Corporation's report of $10,900,000 earnings in the last quarter of 1914, or $2,500,000 less than the previous low record, in 1904, shows that the last two months of the year were worse than was generally known at the time.

Some further rail orders have been given out—close to 75,000 tons in the West, of which 40,000 tons went to the Colorado mill. The St. Paul and the Rock Island are inquiring for about 25,000 tons. Recent rail orders will give the Gary mill work for two months, and in view of its starting up on Feb. 8 one of the idle blast furnaces there has been blown in. The Steel Corporation is also to blow in this week a furnace at Lorain, Ohio, and two in the Pittsburgh district. Active ingot capacity of the corporation is now close to 50%.

In structural work a somewhat better prospect is indicated. About 37,000 tons is represented in live projects in the East and for track elevation at Indianapolis 20,000 tons will be required.—"The Iron Age."

SOUTHERN

LOUISVILLE

Market continues weak in spite of the colder weather. Steam demand picking up.

Though it was expected that the return of cold weather could be counted upon to improve conditions, the Kentucky coal market is virtually unchanged from a week ago. The industrial demands are said to be improving considerably and prices on those grades are better than they have been. The domestic grades, however, do not show the activity the operators would like to see, the retail dealers still having large stocks on hand.

The highest price being received for any Kentucky coal is $1.85 for high-grade eastern Kentucky lump. Other prices for lump range down to $1.50 while there are reports current of domestic coals on demurrage selling as low as $1.40. Nut and slack from the eastern sections range from 75 to 80c. for the best grades and 45 to 50c. for the lower grades. Low grade western Kentucky nut and slack is going at from 40 to 45c. or thereabouts.

BIRMINGHAM

Steam coal shows some improvement and lump is slightly better.

Steam coal seems to have shown improvement during the past ten days, the demand being some brisker, with prices about the same as for the past month or two. Lump coal shows very little, if any, improvement, many of the producers of this grade having a large tonnage on cars at the mines waiting for orders. On an average, the mines are working about three days per week. Blacksmith coal is normal, business being satisfactory to the operators and prices holding up.

MIDDLE WESTERN

CHICAGO

Stagnation the rule. Prices of Illinois coals spotty, but Indiana grades are held more firmly. Trend of screenings not encouraging. Anthracite situation healthy.

The last week has been more or less discouraging to the Indiana and Illinois trade, and it is quite evident that the demand has shown a decided slump. Although snow and colder weather have made their appearance, stagnation in the movement and demoralization of prices are quite apparent. Production has been curtailed, but not sufficiently to affect prices. Indiana coals show more resistance than the Illinois product.

The stocks of retailers are low, but they are placing very few orders. A number of shippers complain of inability to collect promptly from country dealers, who report that they are unable to effect collections from the public with any degree of promptness.

There is a great difference of opinion as to the future prices of screenings and steam coals. Apparently there is an over-supply of steam coals on the market at this time, which is mainly the cause for the recession in quotation. The existing uncertainties make a policy of caution wise.

Franklin County operators have reduced their circular on lump, egg and No. 1 nut from $2 to $1.75, and it is said that in a considerable number of cases shipments have been made as low as $1.50. Screenings have declined about 5c. per ton. The situation is about the same in Williamson and Saline Counties.

The production of the Indiana mines is still on a reduced scale, but prices have been maintained on a fairly firm basis. Mines are operating on about a three day basis per week. Block coal shippers in Indiana report a fair demand at good prices.

Eastern Kentucky coals are not very strong, and the fluctuation in prices shows a wide range.

Hocking grades are in the doldrums, and there has been quite an accumulation of unsold coal on hand; $1.50 for lump is about the maximum price.

A few unsold smokeless shipments were sacrificed at low prices this week, but the forwarding of free coal to this center has been restricted and prices are comparatively firm.

The anthracite situation is in marked contrast to the bituminous. The tonnage absorbed is as great as in any January of previous years. The supply of chestnut hardly equals the demand, and at times there is a small over-supply of egg and stove. Increased shipments from independent operators are noted at prices approximately 15c. per ton under circular.

Prevailing quotations are as follows:

	Franklin Co.	Springfield	Sullivan	Clinton	Carterville

INDIANAPOLIS

More snow fell just as the trade was expecting a falling off in orders. Buying renewed, both wholesaler and retailer benefiting.

Just as the coal trade was settling down to a duller situation, on account of the milder weather, a heavy fall of snow came, covering nearly the whole state to the average depth of about fifteen inches and accompanied by low temperature. The usual spurt in orders to retailers and wholesalers followed.

The mines are on fair schedule, some of the larger companies operating full time. Prices have not changed, either at the mines or at retail. Slack is in good demand at around 80c. It is expected the snow will have some effect on transportation, especially if the temperature stays around zero. February in Indiana is usually a stormy month and a good one for the coal trade, so the operators are fairly comfortable over the present situation.

ST. LOUIS

Low temperatures and heaviest snows of the season fail to stimulate any business. Steam consumers are apparently well stocked.

In spite of extremely favorable weather conditions that should bring about a bettering of the market, prices remain the same, and there has been a marked inactivity in the trade. With the heaviest snow of the season and a temperature around zero, prices are the same as they have been for the past two or three weeks, with a tendency to weaken. This applies to domestic sizes, screenings and the steam coals. The slow movement of domestic grades is accounted for by the fact that the retail yards throughout this section are loaded up with contract coal, and there is no open buying. Steam plants are well stocked up and a great many of them are not working at all.

Conditions in the Williamson and Franklin County field have not been as bad at any time since last August. The only strong coal right now is No. 1 washed. In the Standard field coal is sold at the cost of production, and there seems to be no demand even then.

Very little anthracite is moving in, and practically no smokeless. If this weather continues for a week or ten days, the market should be in a healthy condition, as all stocks will have to be replenished. Retail dealers find business exceptionally good on small quantities only.

The prevailing circular is:

	Williamson and Franklin Co.	Big Muddy	Mt. Olive	Standard	Sparta

KANSAS CITY

Demand for coal has been increased somewhat due to the colder weather. Dealers stocking up. No change in prices.

For the second time this season Kansas City has had a touch of winter but the market has not been affected as much as it would have been had this change occurred in a normal winter. It has, however, shown some change for the better. Steam coal is in good demand, though there has been no change in prices. Illinois grades are still strong. Kansas coal is also moving well, but the Missouri product is a little weak. There is a slight prospect for a change in prices about Feb. 1, but this will not occur if the weather should turn warm again.

SPOKANE

The first fluctuation in prices since last winter have occurred. A moderate winter with but one short span of cold weather has in no way depleted the stocks of local dealers. The following standard coals are now holding firm to the prices noted:

Kind of Coal	Cost	Selling	Kind of Coal	Cost	Selling
Rock Springs nut....	$5.50	$7.50	Peacock Rock Springs	$5.50	$7.50
Monarch...........	5.50	7.50	Bear Creek.........	6.50	8.50
Carney............	5.50	7.50	Kooi	5.50	7.50
Castle Gate.........	6.75	8.50	Kirby nut..........	5.45	7.50
Corbin Steam.......	4.25	4.75	Kirby lump.........	5.85	8.00
Smith..............	6.50	8.50	Kirby egg lump.....	6.35	8.25
Owl Creek..........	6.50	8.50	Bellview steam......	4.25	5.00

PORTLAND

The possibilities of extending the anthracite trade i looked upon as very favorable with the opening of the Par ama Canal and the promised opening of the Celilo Canal i the upper Columbia River next summer. With the completio of the government locks at Celilo it will be possible t reship coal from the ocean steamers here to barges or rive steamers for points in the great Inland empire where coal in much greater demand per capita at the rate of six to on than in western Oregon by reason of the lack of wood fu there.

Coal Contracts Pending

Contracts listed in this department are authoritative in very respect except where the source of information is uestionable, in which event it is noted. All contracts re listed promptly on receipt and only repeated when dditional information becomes available or in the last ssue previous to the day on which bids will be closed. iberal remuneration will be paid for all legitimate otices of this kind sent in.

Contract No. 24—United States Navy—This contract, which rovides for coaling naval vessels at 82 different ports (p. 33, Vol. 6), is being held up because of the European war. t is probable that awards may be made covering ports on ne east and west coasts of Mexico; but with the uncertaines regarding deliveries at European ports, it is not condered advisable to attempt covering the naval requirements t those points. For the time being coal will be purchased s required without making any advance contracts. Address aymaster-General, United States Navy, Washington, D. C.

Contract No. 47—Batesville, Ark.—The Municipal Electric ight & Water Plant of Batesville will be in the market for 00 tons of mine-run coal on Feb. 1. The approximate price $3.35 per ton, and the coal is bought on a competitive basis, ne usual test being the cost of evaporating 1000 lb. of water the company's boiler plant. Address W. H. Walkup, supertendent, Batesville Water & Light Plant, Batesville, Ark.

Contract No. 49—Harlan, Iowa—The Municipal Electric ight Plant of Harlan will be in the market for 2800 tons of al about the first of next month. They commonly use Colx (Iowa) steam coal, and the contract is let on a competive basis, usually about Feb. 1. Address C. D. Lutton, supertendent, city of Harlan Light Plant, Harlan, Iowa.

Contract No. 60—Detroit, Mich.—Bids on this contract (p. 9), which provides for furnishing the Department of Public orks with its coal requirements for the next year, were as llows:

UNITED FUEL & SUPPLY CO.—For the ash plant, Richood, ¾ lump, $2.30; mine-run, $2.20; for the B. I. Bridge and ump Station, Richwood, ¾ lump, $2.85; mine-run, $2.75; anracite chestnut and stove, $7.20; egg, $7.10; Pocahontas, $4.

THE P. KOENIG COAL CO.—For the ash plant, Meadow rook, ¾ lump, $2.40; mine-run, $2.30; for the B. I. Bridge d Pump Station, Meadow Brook, ¾ lump, $2.95; mine-run, .90; nut, pea and slack, $2.75; anthracite chestnut, $7.50; ove and egg, $7.25; Pocahontas, $3.50.

MICHIGAN BUILDERS SUPPLY CO.—For the ash plant, mbridge, $2.30; for the B. I. Bridge and Pump Station, Camidge lump, $4; mine-run, $3.90; anthracite, $8; Pocahontas, .40.

R. T. AYLWARD—For the ash plant, Island Creek, $2.50; r the B. I. Bridge, Island Creek, $3.50; for the Pump Station, land Creek, $3.25; anthracite chestnut, $7.35; stove and egg, .25; Pocahontas, $3.85.

J. CALVERT'S SONS—For the ash plant, West Virginia ine-run, $2.50; ¾ lump, $2.60; for the B. I. Bridge and Pump ation, mine-run, $3.24; ¾ lump, $3.34; anthracite chestnut, .49; Pocahontas, $4.25.

Address George H. Fenkell, Commissioner of Public Works, ty Hall, Detroit, Mich.

Contract No. 64—Columbus, Ohio—The city of Columbus ill receive bids until Feb. 4 for furnishing 725 tons of tuminous lump coal. Shipments are to be made at the rate 200 tons per month, deliveries to be at Columbus, Ohio. ldress B. L. Bargar, Director of Public Safety, Columbus, hio.

Contract No. 65—Columbus, Ohio—Bids will be received by e city of Columbus for furnishing coal as follows: Twelve ousand tons for the municipal lighting plant; 6000 tons for e Scioto River Pumping Station; 2500 tons for the Garbage duction Works; 380 tons for miscellaneous departments of e city government. Bids will be opened Feb. 5. The coal is be delivered to the various departments as required and ch bidder must submit specifications for different grades coal. The law requires that any corporation making a bid ust submit their own full name or title, as well as that of all other parties interested, and all bids must be accompanied by a bond amounting to 50% of the contract.

Contract No. 66—Guantanamo Bay, Cuba—Telegraphic bids were requested by the Naval Department until noon, Jan. 27, for furnishing and transporting 5000 tons of coal to Guantanamo Bay, Cuba. Navy standard coal is required and a daily discharge rate of 300 tons per day is guaranteed. Address Samuel McGowan, Paymaster-General of the Navy, Washington, D. C.

Contract No. 68—Sheridan, Wyo.—Sealed bids will be received until 10 a.m., Feb. 2, for furnishing and delivering coal for one year to the City of Sheridan, commencing Feb. 5, 1915. Address James T. Withrow, County Clk., Sheridan, Wyo.

Contract No. 69—Millvale, Penn.—Sealed bids will be received until 5 p.m., Feb. 2, for furnishing three-quarter or run-of-mine coal for the Millvale Water Works. A certified check of $100 must accompany each bid and the contract requires delivery to be made in bins. William Fox is Pres. of the Borough Council. Address H. H. Dixon, Borough Clerk, Millvale, Penn.

CONTRACTS LET

Contract No. 33—Yonkers, N. Y.—This contract (p. 1009, Vol. 6), which provides for furnishing 300 gross tons of steam coal and 60 tons of nut coal, to be delivered at the bath houses; 250 tons of Scranton pea coal to the crematory; 280 tons of egg coal and 10 tons of steam coal to the City Hall building, has been awarded to Hays & Randolph, Yonkers. Address E. P. Walsh, Secy., Board of Contract and Supply, City Hall Building, Yonkers.

Contract No. 34—Newark, N. J.—This contract (p. 1009, Vol. 6), which provides for furnishing and delivering 800 gross tons of buckwheat coal has been awarded to Joseph H. Lucking, Sussex Ave., Newark, at $3.10 per ton. Address, M. R. Sherrerd, Ch. Engr., Board of Street and Water Commissioners.

Contract No. 39—Youngstown, Ohio—Bids on this contract (p. 39), which provides for furnishing and delivering 20,000 tons of coal f.o.b. cars at the City Water Works Pumping Station, Filtration Plant, and City Crematory, were made as follows:

Name	Run-of-Mine	Nut	Slack	Nut and Slack 1½ In.	3 In.	Crusher Mine-Run	Nut and Slack

Totals.........	$3,140.20	$3,026.60	$3,008.40	$3,078.00	$3,222.60

Address, Mr. McCoy, Contract Clk., Municipal Bldg., Crotona Park, 177th St. and Third Ave., New York.

Contract No. 46—New York—The important bids, including the awards, on this contract (p. 149), which provides for furnishing and delivering white ash anthracite coal, as required, to the various office buildings, clinics, hospitals, day camps and disinfecting stations of the Department of Health, in New York, and at the tuberculosis sanitarium at Otisville, Orange County, N. Y., were as follows:

CLASS NO. 1—For delivering 2000 tons No. 1 buckwheat and 100 tons stove coal at the Willard Parker Hospital: Charles D. Norton Co., $6740; John W. Peale, $6656; George D. Harris & Co., $6160; Meeker & Co., $6728; Pattison & Bowns, $6619 (awarded contract); Commercial Coal Co., $7690.

CLASS NO. 13—For delivering 2500 tons No. 1 buckwheat and 100 tons stove coal to the Riverside Hospital: Charles D. Norton Co., $9117; John W. Peale, $8818 (awarded contract); George D. Harris & Co., $8325; Meeker & Co., $8918; Pattison & Bowns, $9014; Commercial Coal Co., $10,264.

CLASS NO. 21—For delivering 2500 tons No. 1 buckwheat and 75 tons stove coal to the Kingston Ave. Hospital: Charles D. Norton Co., $10,051.25; John W. Peale, $10,367.75; George D. Harris & Co., $9700; Meeker & Co., $10,245; John F. Schmadeke, $9984.25 (awarded contract); Bacon Coal Co., $10,077.50.

CLASS NO. 24—For delivering 250 tons of stove and 250 tons of pea coal to the Riverside Hospital: Meyer Denker, Sinram Co., $2550 (awarded contract); Burns Bros., $2710.

CLASS NO. 26—For delivering 1000 tons of stove and 100 tons of nut coal at the tuberculosis sanitarium, Otisville, N. Y.: John W. Peale, $6985; Pattison & Bowns, $6600; L. R. Wallace, Middletown, N. Y., $6284 (awarded contract).

Address Chief Clerk, Department of Health, Center and Walker Sts., New York.

Contract No. 48—New York—The bids on this contract (p. 149), which provides for furnishing and delivering 15,000 tons of mixed coal at St. George, Richmond, and 6000 tons of mixed coal at 39th St., Brooklyn, were as follows: For 15,000 tons, Geo. D. Harris & Co., $2.84; Chas. D. Norton Co., $2.89; Meeker & Co., $2.97; Gavin Rowe, $2.98; H. H. Lineaweaver & Co., Inc., $2.81; Pattison & Bowns, $2.97; Cullen Transportation Co., $2.75; W. P. W. Haff, $2.83. For 6000 tons mixed coal, Geo. D. Harris & Co., $2.79; Chas. D. Norton Co., $2.89; Meeker & Co., $2.97; Gavin Rowe, $2.98; H. H. Lineaweaver & Co., Inc., $2.81; Pattison & Bowns, $2.97; Cullen Transportation Co., $2.75; W. P. W. Haff, $2.83; John W. Peale, $3.19. Cullen Transportation Co. was awarded the contract. Address T. J. Slattery, Dept. of Docks and Ferries, Pier A. foot of Battery Place, North River, New York.

Contract No. 56—Milwaukee, Wis.—This contract (p. 189), which provides for furnishing 2000 tons of coal to the Menominee special sewerage pumping works, has been awarded to the Milwaukee-Western Fuel Co., 4 Grand Ave., Milwaukee, at $3.70 per ton (14,400 B.t.u.). Other bids were: Pennsylvania Coal & Supply Co., Milwaukee, $3.95 (14,200 B.t.u.); Wisconsin Coal & Dock Co., Milwaukee, $3.97 (14,300 B.t.u.). Address Frederick G. Simmons, Comr. of Public Works, or Percy Braman, deputy, Milwaukee, Wis.

FOREIGN MARKETS

GERMANY AND AUSTRIA

Some acute shortages have developed but the situation is now generally easy. Changes in transportation routes. Austrian government takes over a British colliery in Koenigswart.

East and West Prussia—Before the war the cities of Hamburg, Berlin and the Baltic depended chiefly upon Great Britain for household coals, on account of the better quality and the low ocean freights. These towns are forced now to seek their coal supplies from the Upper Silesian fields and, unfortunately, deliveries were greatly held up by the scarcity of railway transportation. Finally, the requirements of East and West Prussia were filled by shipping the coal down the Oder in barges to Stettin, this means of transportation having been developed a few years ago in consequence of a labor strike.

The Ruhr—This market has reached nearly normal conditins. There is a strong demand from Belgium and Holland which has been met, in part. Low water in the Rhine has affected shipments unfavorably. The demand for anthracite is unusually strong and these coals are scarce. The Syndicate has given notice of an advance of 29c. a ton which took effect, Jan. 1.

Vienna—The middle of November found Vienna facing a coal famine, deliveries from Silesia having fallen off 60% as the railway facilities were taxed to the limit by the military necessities of the campaign in Poland. The municipal authorities obtained an Imperial order forcing the soft-coal and lignite mines of Northwest Bohemia to make good the deficiency, and arrangements were perfected with twenty coal operators, to forward 3000 tons lignite. Further trouble was experienced in Vienna in the house deliveries, about one-half the teamsters having gone to the front; but the absolute wants of all are now being satisfied and the winter's supply is assured. The Britannia Coal Works, Limited, in Koenigswart, has been taken over by the Austrian government, which has appointed a commission to administer its affairs. The capital of the company is 2,568,000 kronen, of which 2,183,000 kronen are owned by John R. W. Griffith, Hendersyde Park, England—"Zeitschrift des Verbandes der Bergbau-Betriebsleiter."

GREAT BRITAIN

Jan. 15—Owing to scarcity of tonnage the position is a little irregular for prompt loading. For forward loading the tone is firm. Quotations are approximately as follows:

Best Welsh steam.......	$4.92@5.04	Best Monmouthshires....	$4.26@4.32
Best seconds...........	4.56@4.68	Seconds................	4.14@4.20
Seconds................	4.32@4.44	Best Cardiff smalls......	3.12@3.24
Best dry coals..........	4.56@4.68	Cargo smalls...........	2.64

The prices for Cardiff coals are f.o.b. Cardiff, Penarth or Barry, while those for Monmouthshire descriptions are f.o.b. Newport, both net, exclusive of wharfage.

Freights—Tonnage is scarce and rates show a further considerable rise. Long delays are still being met with at various discharging ports. Rates are approximately as follows:

Gibraltar.........	$5.04	Naples..........	$7.20	Las Palmas......	$5.52
Malta............	6.00	Venice, Ancona...	9.00	St. Vincent.......	5.76
Marseille........	7.92	Alexandria.......	7.20	Rio Janeiro......	6.00
Algiers...........	5.52	Port Said........	7.20	Monte Video.....	5.88
				River Plate......	6.12

PRODUCTION AND TRANSPORTATION STATISTICS

CHESAPEAKE & OHIO RY.

The following is a comparative statement of the coal and coke traffic from the New River, Kanawha and Kentucky districts for November and the five months of the fiscal years 1913 and 1914, in short tons:

COAL AGE

FLOYD W. PARSONS, *Editor*

Published Weekly by HILL PUBLISHING COMPANY
Tenth Avenue at Thirty-sixth Street, New York, N. Y.
JOHN A. HILL, Pres. ROB'T McKEAN, Sec'y.
Cable Address, "COAGE," N. Y.

Correspondence suitable for the columns of COAL AGE solicited and paid for. Name and address of correspondents must be given—not necessarily for publication. Subscription price $3 per year, in advance, for 52 numbers to any postoffice in the United States or possessions, and Mexico. $4 to Canada. $5 or its equivalent to any other foreign country.

Subscribers in Great Britain, Europe and the British Colonies in the Eastern Hemisphere may send their subscriptions to the London Office, 6 Bouverie St., London, E. C., England. Notice to change address should be written to the New York Office in every instance.

Advertising copy should reach New York Office by Thursday of week prior to date of issue. Entered as second class matter, October 14, 1911, at the Postoffice at New York, New York, under the Act of March 3, 1879.

VOLUME 7 FEBRUARY 6, 1915 NUMBER 6

CONTENTS

WITH PRINCIPAL ARTICLES SUMMARIZED

*Illustrated Article

FOREWORD—POWER-PLANT ECONOMY AND CONSERVATION OF COAL: *Page* 233

Showing how coal companies can effect large savings in operating costs, and at the same time increase their total production of marketable coal. Low-grade fuels containing a high percentage of ash can only be advantageously utilized by employing mechanical stokers and conveying machinery. John Van Brunt. COAL AGE, Vol. 7.

*GENERATING STATIONS AND SOME FEATURES GOVERNING THEIR DESIGN: *Pages* 234-244

Modern power stations are of three distinct varieties according to the working fluid, steam, water or gas employed. Although the prime movers and generators vary radically in these various types, the control and transmission apparatus in all three classes of plants are strongly similar. E. A. Lof. COAL AGE, Vol. 7.

PLANT OF THE ALBA-MELAKOFF LIGNITE CO. IN TEXAS: *Page* 244

*THE HOW AND WHY OF THE CONDENSER: *Pages* 245-247

The usual method of calculating the efficiency of a condenser is to compare the actual vacuum attained with that theoretically possible. The ratio of the vacuum and hotwell temperatures tells a different story. H. E. Beyer. COAL AGE, Vol. 7.

EXTRACTS FROM A SUPERINTENDENT'S DIARY: *Page* 247

*THE STOKER IN COAL-MINE POWER PLANTS: *Pages* 248-249

True conservation applies alike to the production and utilization of any natural resource. By means of proper equipment, the producers of coal can make use of low-grade fuel, thereby releasing to the market a salable product. Alfred Lotz. COAL AGE, Vol. 7.

UNIMPORTANCE OF POWER QUESTIONS IN JIG PROBLEMS: *Page* 250

George R. Delamater. COAL AGE, Vol. 7.

THE COMPARATIVE COST OF ELECTRICAL HEATING: *Page* 250

*A GATE-END SWITCH BOX: *Page* 251

COAL AGE, Vol. 7.

COAL AND COKE NEWS: *Pages* 266-269

COAL TRADE REVIEWS: *Pages* 270-276

COAL CONTRACTS PENDING: *Page* 275

COAL, THE BIG ITEM IN POWER-PLANT OPERATION: *Page* 251

LABOR SITUATION: *Page* 252

The miners' officials finally consented to arbitrate the eastern Ohio strike. The coal companies are not disposed to concede the straight run-of-mine scale, formerly offered, believing a slack differential desirable and wholly legal. John D. Rockefeller, Jr., meets some of the officers of the United Mine Workers of America at his office. John R. Lawson and John Mitchell testify before the Industrial Relations Commission. A strike occurs in the anthracite region. COAL AGE, Vol. 7.

CENTRAL-STATION POWER: *Pages* 253-254

Many contracts for central-station power are unfair. Such agreements to be equitable should be composed of three elements: A fixed charge depending on the peak load; a flat rate per kilowatt-hour; and, if power-factor is a consideration, a limit should be fixed, a high value receiving a lesser charge per unit of power, while a low value should be penalized. Wilfred Sykes. COAL AGE, Vol. 7.

THE MINE FOREMAN: *Page* 255

*ELECTRIC SHOTFIRING IN BITUMINOUS MINES: *Pages* 255-256

RUN-OF-MINE TALKS

ON YOUR BUSINESS AND OURS

By the Business Manager

RUNNING A COAL mine is some responsibility — there's no doubt about that. But still there are many mine managers and superintendents who are actually assuming more responsibility than they have to.

I mean that today the wise super shifts the burden of responsibility in buying equipment, for instance, off his own shoulders and puts it onto advertising.

He buys only goods that are backed by the guarantee of continuous advertising and thus takes no unnecessary chances.

▫ ▫ ▫

J. H. NEEDHAMMER, Superintendent of Mine No. 2, Jackson Hill Coal Co., at Sullivan, Indiana, writes us as follows, on this subject:—

> "Your advertising pages have kept me in close touch with the new equipment, and I have frequently recommended the purchase of supplies and equipment advertised in your publication.
>
> "I have just decided to purchase the mining instruments advertised by the Davis Instrument Mfg. Co., Inc., of Baltimore, Md., and if they prove as satisfactory as previous purchases of other equipment I shall be well satisfied.
>
> "Past experience has taught me the reliability of Coal Age advertisers, and when I recommend the purchase of supplies advertised in your paper I do so without misgiving, and am willing to assume the responsibility for the order."

▫ ▫ ▫

YOU KNOW, if you come right down to it, a good part of modern efficiency in buying depends upon your familiarity with the advertising pages and advertised products in your technical paper.

If you haven't realized this truth, think it over.

Let Advertising Take Part of the Burden off Your Mind.

COAL AGE

Vol. 7 NEW YORK, FEBRUARY 6, 1915 No. 6

Power Plant Economy and Conservation of Coal

Of late the question of natural resources and their conservation has had much attention and has been the subject of scientific and congressional investigation, and, to some extent, legislation.

One great natural resource, coal, can be conserved to the extent of utilizing what is now a waste product of mining operations, and be thus made to accrue to the immediate financial benefit of the mine owner.

As there is no cheaper fuel at the mine than its product—coal—in the average mine boiler plant, little attention has been given to securing the maximum production of power from the coal used. The cheapness of the fuel has apparently made it unnecessary to go to any expense to insure proper combustion.

Consider the waste products of anthracite mines—culm — silt — washery refuse, etc., having a good heat content, but no market value—of bituminous mines, refuse with 25 to 35 per cent. ash and slate; plenty of heat units, but again an unsalable product.

Many anthracite mines are burning the smaller sizes of buckwheat in their boiler plants and piling up immense heaps of waste, just as bituminous developments are burning run-of-mine and slack and piling up refuse banks. With the exception of a few large operations it has been, and is still, the practice to use a marketable coal hand-fired by cheap labor.

Some of the large anthracite producers have modernized their power plants by installing large boiler units, fired with mechanical stokers, by means of which culm or silt can be economically burned. This releases for the market the coal formerly consumed. The same stoker has created a demand for the size of fuel employed, so that contracts are now being made for the shipment of what is commercially known as No. 3 and No. 4 buckwheat.

By the use of stokers and conveying machinery for coal and ashes, there is also a great saving in non-productive labor. Although some large bituminous producers have installed modern equipment and are utilizing refuse, the possibilities have hardly been touched, as millions of tons of this material are thrown away annually. Each mine probably disposes of more than enough to operate its own power plant.

To burn a low-grade fuel containing 25 to 35 per cent. of ash, by hand-firing, is difficult, if not impracticable. Only by the use of mechanical stokers and conveying machinery can it be utilized to advantage.

With a properly-designed equipment of boilers and stokers, with forced draft, together with coal and ash conveying machinery, it is possible to operate boilers considerably in excess of their rated capacity with refuse of this character; and at the same time the labor cost per ton of fuel fired is greatly reduced.

Coal that was formerly used at the mine will then be available for market.

The cost of refuse as fuel may be taken as the fixed charges, maintenance and operating expense on the stokers and conveying machinery, plus the boiler room labor. Comparing this cost with that of using a salable fuel charged against the boiler plant at the market value, plus boiler room labor, it will be seen that the net saving is a large one which cannot well be overlooked.

The difference would pay for the stokers and conveying machinery in a short time.

This general proposition applies to both anthracite and bituminous operations. Each plant, however, presents its own peculiar problems.

If these are intelligently studied, the proper selection of equipment cannot but result in large savings in operating costs and an increased production of marketable coal.

—By John Van Brunt.

Generating Stations and Some Features Governing Their Design

By E. A. Lof*

SYNOPSIS—Modern power stations are of three distinct varieties according to the working fluid employed—steam, water or gas. Although the prime movers and generators vary radically in these various types the control and transmission apparatus in all three classes of plants are strongly similar.

Electricity is not in itself a primary source of energy. To become available for conversion into electric power, the forces found in nature must first be converted into mechanical energy by some form of prime mover. In all practical cases electric current is again transformed before being utilized. Electricity is therefore the most convenient form in which, for many purposes, energy may be transmitted and distributed.

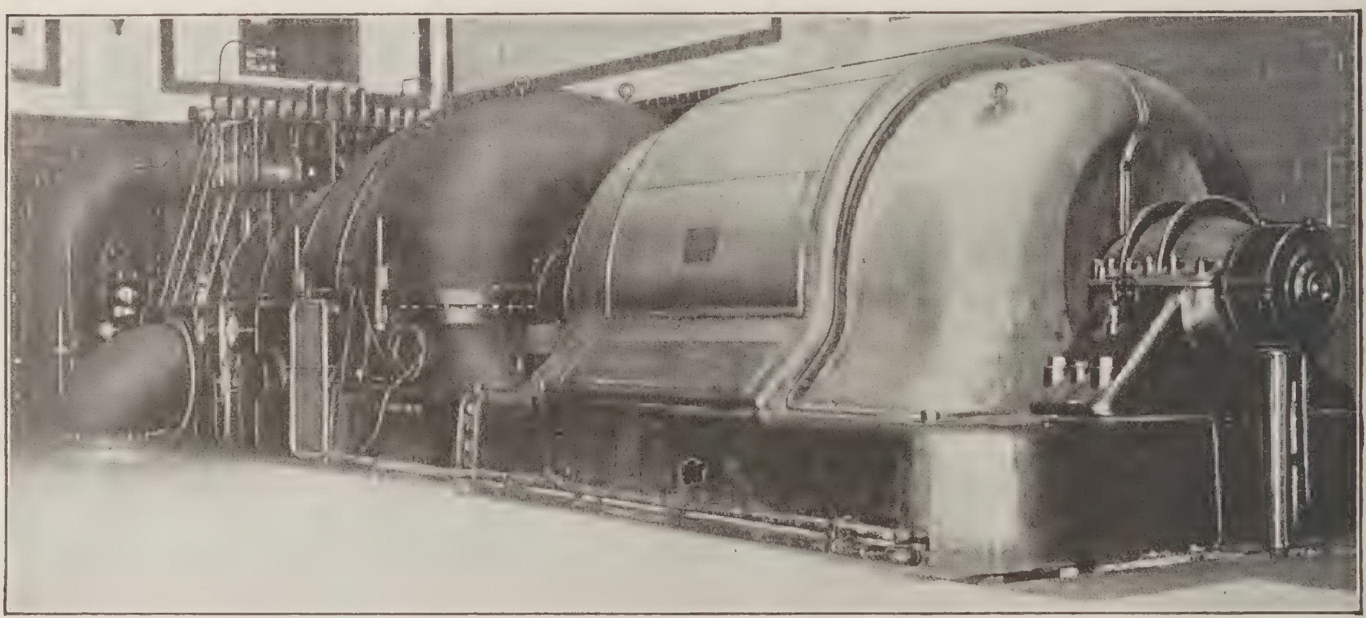
It is needless to dwell upon the enormous increase that has taken place in the use of electric power during the past 10 or 15 years. The rapid advance is best illustrated by a reference to the accompanying curves, which are self-explanatory. For the generation of this power, the steam turbine and the waterwheel stand foremost, and it is an astonishing rate at which the size, as well as the efficiency of these prime movers, has increased of late. A single-unit 35,000-kw. steam turbo-generator is now under construction and there is every reason to believe that the 50,000-kw. mark will be passed in the not very distant future.

Comparing the above unit with those of 10 years ago it is interesting to note that the over-all efficiency has been increased something like 20 per cent. while the weight per kilowatt has been reduced more than half.

Similarly with waterwheels and internal-combustion engines, the former are now being built in sizes of 17,500 kw., and while an active development of the latter took place a few years ago in connection with the steel industry, their use during recent years has mainly been confined to small and medium-sized isolated plants.

This marked increase in the efficiency of prime movers and electric apparatus, besides the equally pronounced decrease in their cost, has made it possible even for the smallest town to support its own electric lighting plant. The introduction of extensive transmission and distributing systems has, on the other hand, still further lowered the cost of power and makes possible the supply of very small quantities throughout rural districts.

There is at present a strong tendency to connect together two or more plants or systems with a view of interchanging power as conditions require. The result is necessarily increased reliability and improved service conditions. The consolidation of a number of properties under one management and the concentration of a large number of small power plants in one or more large ones have had a marked effect in reducing the cost of electric energy.



A 30,000-Kw. Horizontal Steam Turbine and Generator

There are numerous advantages in such consolidation. The first cost per kilowatt of the large units entering into the construction of a big plant is lower than that of the small units entering into a small plant. The initial expenditure necessary for a given service is therefore reduced as is also the annual fixed charge thereon. A large plant can obviously be operated more economically than a small one. It can afford to maintain a more efficient engineering staff and take advantage of economies which would be out of the question in a small plant.

Another advantage of the large central station lies in serving a diversified load, since one kilowatt capacity of such a station is equivalent to considerably more than one kilowatt if each part of the combined load were to be served separately.

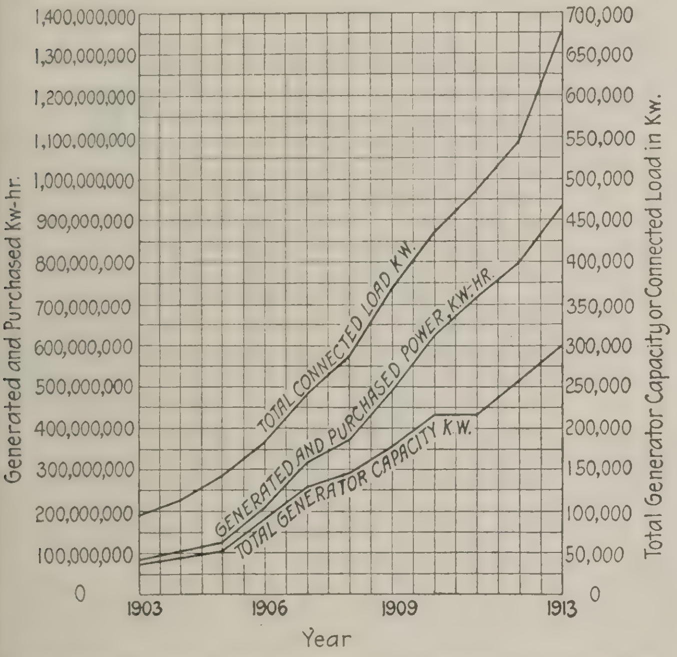
---

*General Electric Co., Schenectady, N. Y.

Admirable examples of what consolidation can accomplish is found in our public-service corporations and the large central stations in our great cities. Notable among the latter is the Commonwealth Edison Co., of Chicago, the enormous expansion of which is clearly illustrated in the accompanying curves.

The load factor of a plant or system is the ratio of the average to the maximum power during a certain period of time. The average power is taken over a certain interval, such as a day, a month or a year, and the maximum over a short period of the heaviest load within that time. In each case the interval of maximum load and the period over which the average is taken should be definitely specified, such as a "half-hour monthly" load factor, the proper interval and period being usually dependent upon local conditions.

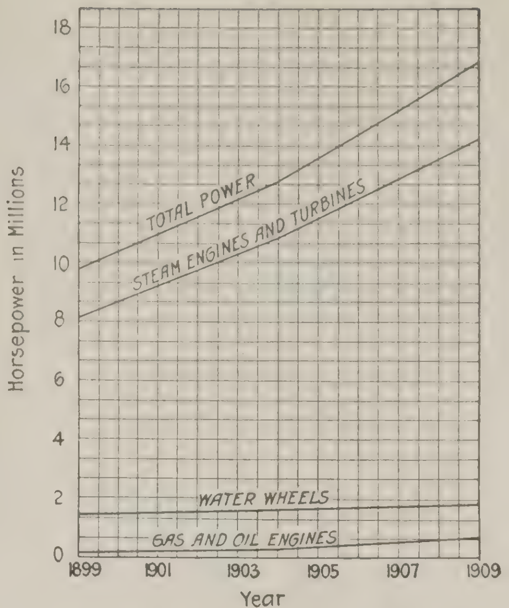
The load factor is therefore in a sense a measure of the extent to which the investment is being utilized, this in turn affecting the cost of the power generated. The ideal conditions would obtain if the station could be operated at its rated capacity for the full 24 hours of the day, but this is evidently out of the question and even a close approach thereto is only possible under special conditions, such as for example in electrochemical industries.



Growth of the Commonwealth Edison Co., Chicago

The subject of load factor is nowadays given careful study and consideration, and marked improvements have been made in increasing the same by our large central stations by combining lighting, street-railway and industrial loads. Thus the Commonwealth Edison Co. operates with a 44 per cent. load factor, while from 30 to 35 per cent. is the average for central-station service.

Reliability is naturally one of the main considerations in any power-supply undertaking. It follows that the more reliable the service is, the higher will be the charge for power, due to the increased investment in reserve equipment and protective devices.



Primary Power Used in Manufacturing Industries

For a steam plant the reserve equipment usually consists of one or more spare units, and while such are also provided in important hydro-electric developments, it is becoming a general practice with the latter to provide auxiliary steam stations.

The function of such stations depends principally upon the hydro-electric development in question, the load and its nature. It may be any one or a combination of the following:

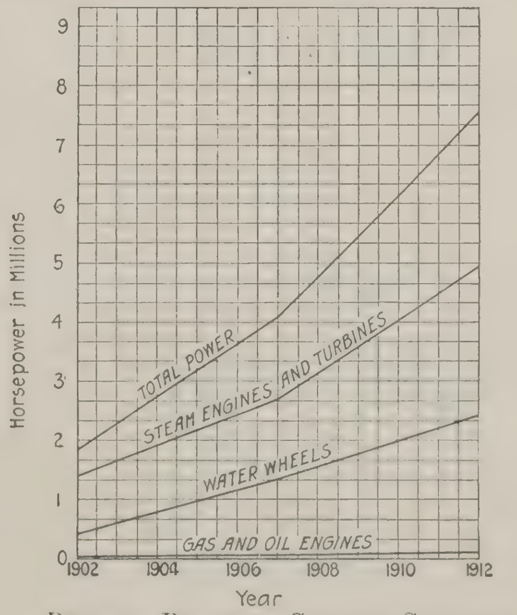
1. To be held as an emergency reserve to take over the load in case of a breakdown in the hydro-electric plant or transmission line.

2. To be held in reserve for periods of low or insufficient water supply.

3. To be held in reserve for peak-load periods.

4. To be operated continuously in conjunction with the hydro-electric plant.

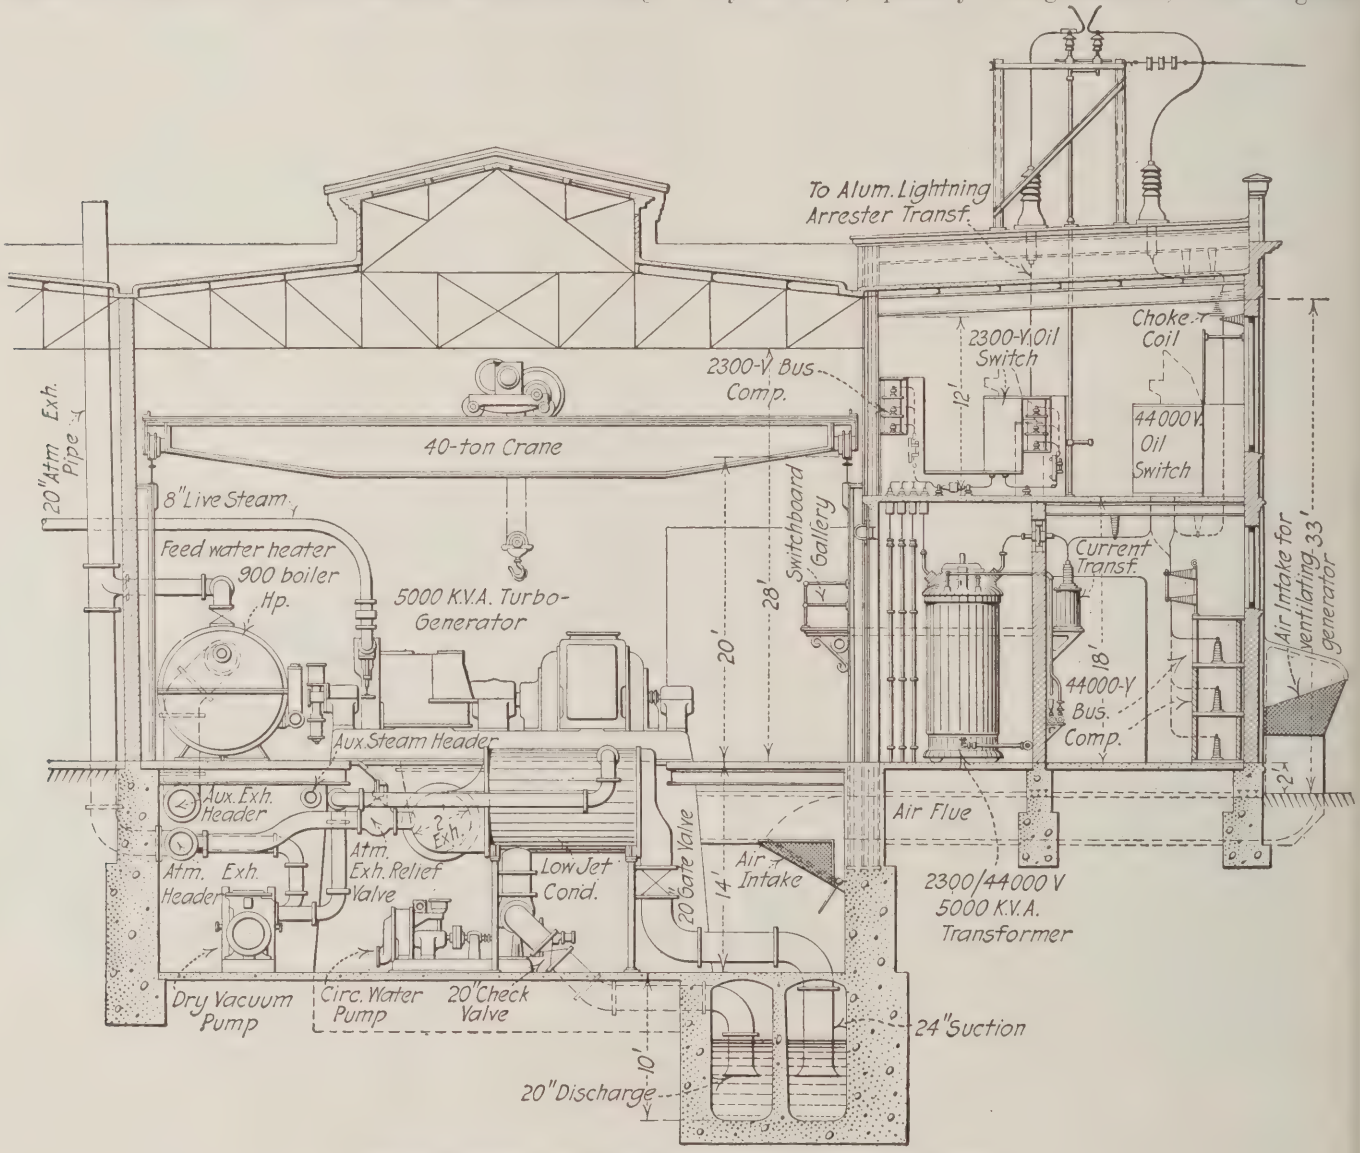
Almost all systems of any importance generate three-phase alternating current on account of its economy and the ease with which it can be transformed and trans-



Primary Power in Central Stations

mitted. Should direct current be required, as for example for traction service, it can readily be obtained by means of converters or motor-generator sets.

The standard frequencies in this country are 25 and 60 cycles, the choice depending upon the service and local conditions of the development. Sixty cycles is, of course, preferable as it is better adapted for lighting, and gives many more possible speeds for generators as well as motors. For long transmission lines or extensive underground systems, the 60-cycle frequency may not be permissible on account of its detrimental effect on the voltage regulation. Changing over from one frequency to the other or tying together two systems of different frequencies can, however, readily be accomplished by means of frequency changers.



Cross-Section of a Steam-Turbine Power Station

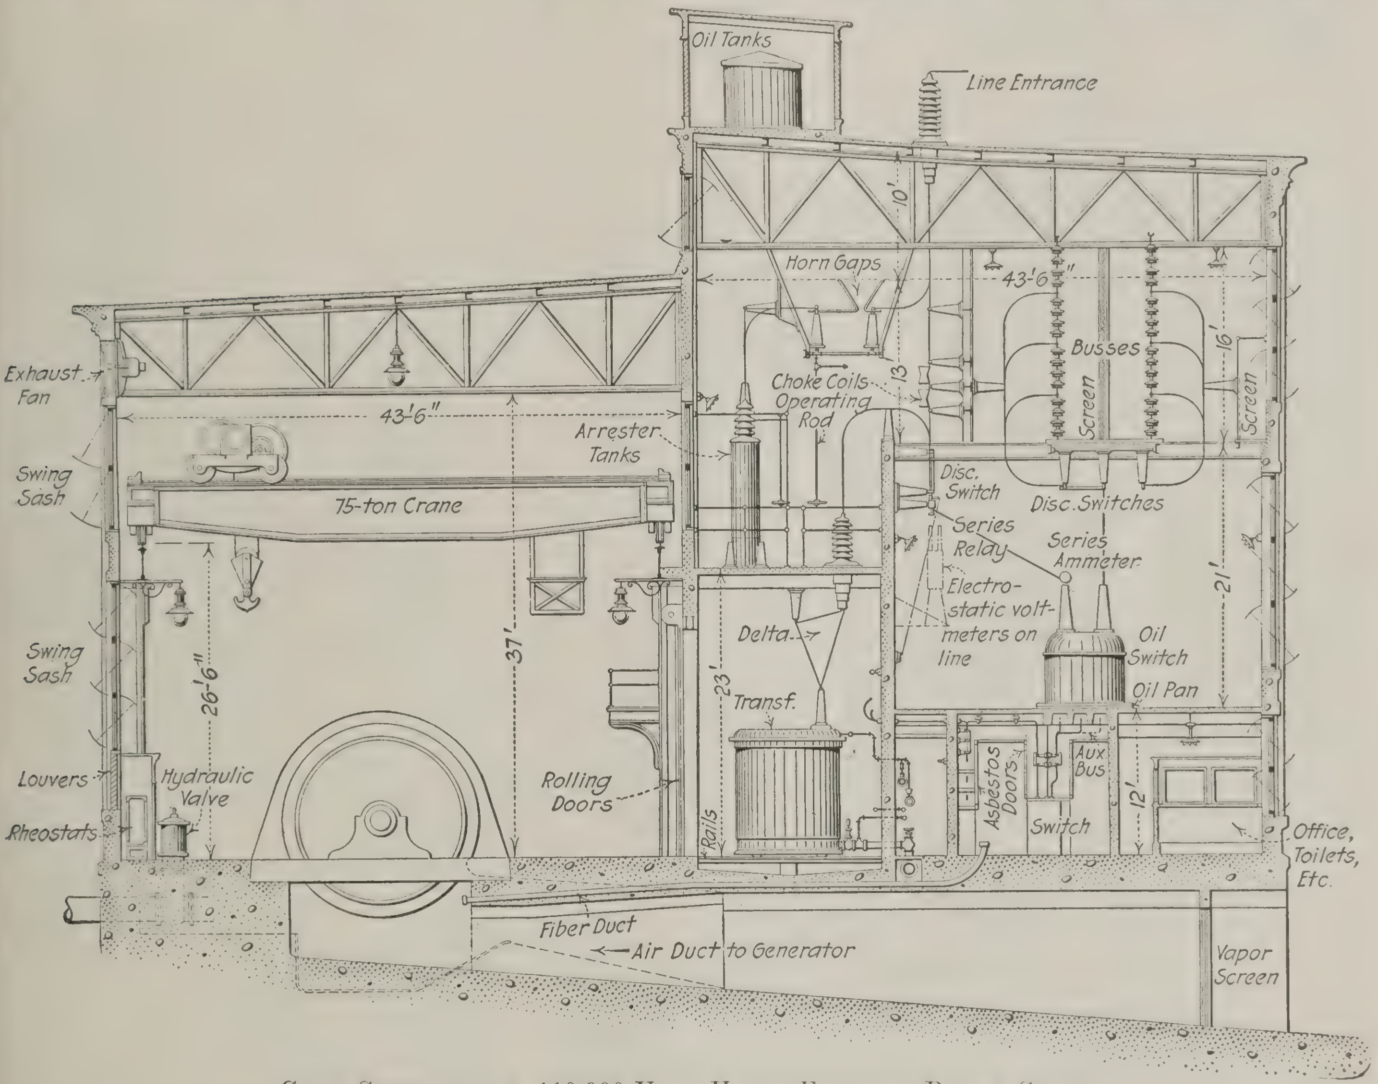
The generator voltage is determined by the nature of the load and the distance of transmission, the standard values ranging from 240 to 13,200 volts. Whether the generators are to be wound for high voltage and direct transmission, or for a lower voltage and used with step-up transformers, is to a certain extent decided by the relative cost of the two methods. If economically feasible the latter method is the more reliable and to be recommended especially for small and medium-sized plants. In other instances the nature of the local load may be such that, by installing high-voltage generators, power for this load may be directly transmitted at the generator voltage, while step-up transformers may be provided for raising the pressure of the current which is to be transmitted for greater distances.

When arranging the apparatus in any kind of power station, simplicity and reliability of operation should be carefully kept in mind. Provision must also be made for symmetrical extensions to the plant to provide for future requirements. The unit principle of installation is generally followed, especially in large stations, the distinguishing feature of which is that the prime movers, generators, transformers, etc., are arranged in separate units or groups, each one of which embodies all the essential features of a complete generating plant, with the great advantage that trouble with any single piece of apparatus is localized and its effect only felt in that unit of which it forms a part.

The boilers may be arranged either in a single or double row facing a firing aisle, running the full length of the station, or there may be several lateral firing aisles, each serving a double row of boilers. Where ground space is valuable, the double-deck feature may be utilized. This, however, requires a heavy building, while on the other hand it complicates operation to a considerable extent

The prime movers and generators are as a rule installed on the main floor in a line parallel with the major axis of the building, and with a sufficient spacing between units to provide for a free passage. With vertical water turbogenerators the turbine proper is located in the basement. This is usually also the case with the condensers in a steam plant. All piping is carried below the main floor, thus avoiding the objectionable appearance of exposed piping.

The exciters should be located in the center of the generator room, so as to reduce the field leads to a minimum and simplify the sectionalizing of the system. Where one exciter is furnished for each generator, they should of course be located as closely to their respective units as possible and are often direct-connected to them.



Cross-Section of a 110,000-Volt Hydro-Electric Power Station

The transformers are mostly placed in compartments on the main floor directly back of the generators, and a track is provided in front of these compartments so that they can be readily removed for repairs.

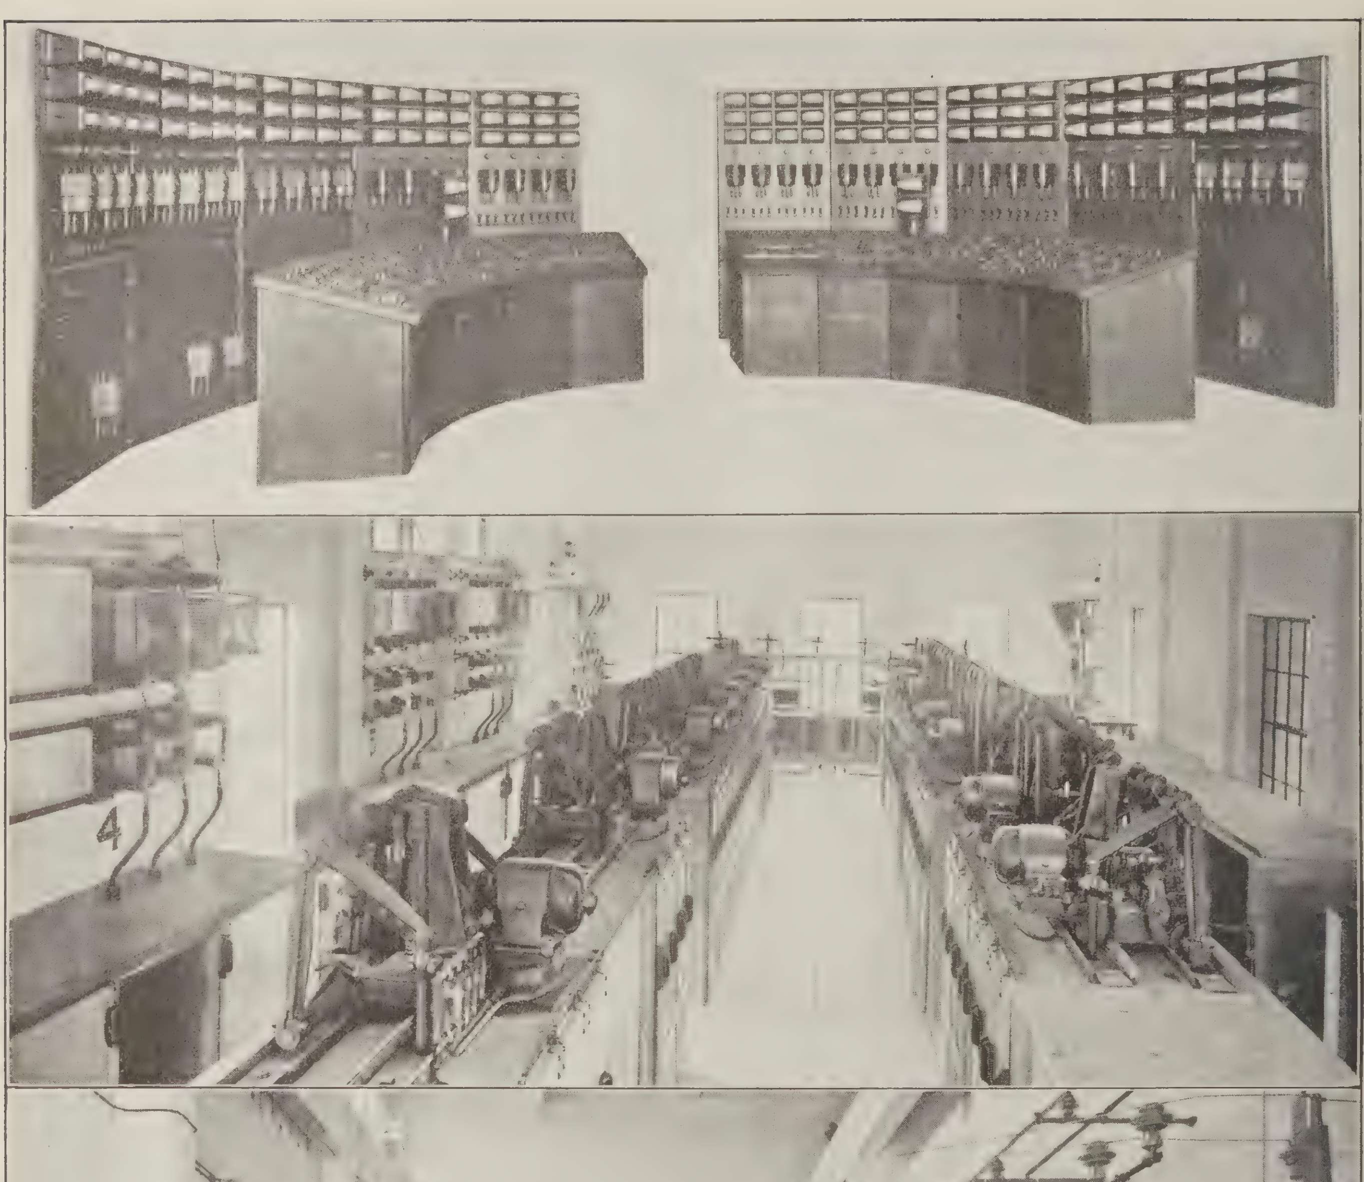
The busbars and oil switches are located on the various floors of the switch-house, with the control board so situated that an unobstructed view can be obtained of the station. It is difficult to fully describe the complete arrangement of all the apparatus in detail, but a reference to the accompanying cross-sections of two modern steam and hydro-electric power stations will clearly explain the same.

For important installations water-tube boilers are the only kind suitable, their design permitting of high steam pressures and the easy application of superheaters and economizers. There exists quite a difference of opinion as to the sizes which should be used. While in large installations, boilers with a rated capacity of 2400 hp. have been installed and are giving excellent results, there are many engineers who think that a 1200-hp. unit is as large as is desirable. For medium-sized installations, on the other hand, units of from 500 to 600 hp. are generally employed.

The particular type of prime mover depends, of course, on the working fluid, i.e., whether steam, gas or water.

Steam turbines are now almost exclusively used even in sizes below 500 kw., as well as for driving auxiliary apparatus such as feed and condenser pumps, etc. High-pressure condensing units are operating at steam pressures from 150 to 250 lb. and for all installations where efficiency is of great importance superheat is used, this varying from about 125 to 150 deg., the vacuum generally employed ranging from 28 to 29 inches.

Marked improvements have been made in the efficiency of steam turbine installations during the past few years. This has been due not only to improvements in design, but also to a wide use of superheated steam and higher vacuum. A 500-kw. unit, for example, when operating on a steam pressure of 150 lb., 125 deg. of superheat and



A Large Switchboard of the Bench Type, a Number of Motor-Operated Oil Switches in a Substation, and the Interior of a Substation Showing Motor-Generator Sets and Step-Down Transformers a 28-in. vacuum, has a steam consumption of approximately 17½ lb. per kilowatt-hour, while a 15,000-kw. unit operating at a steam pressure of 250 lb. with 125 deg. of superheat and a 29-in. vacuum, has the remarkably low consumption of only about 11½ lb. per kilowatt-hour.

When internal-combustion engines are used the gas is usually manufactured in producers, although in steel plants it is obtained from the blast furnaces. It is mainly in this industry in which the gas engine has been used to any considerable extent, the units ranging in capacity from 4000 to 6000 hp., the latter size being the largest available.

The Three Kinds of Head

Water-power plants naturally divide themselves into low-, medium- and high-head installations, requiring wheels of entirely different characteristics. Many developments are also subject to a wide variation in water level, and in many low-head installations the back water may bring about a change in the head which is beyond the capacity of one wheel to accommodate, so that in some plants additional wheels must be mounted on the same shaft and cut into service at times of low head.

The reaction type of turbine is generally used for heads from 10 to 600 ft. and the impulse wheel for heads ranging from about 300 to 3000 ft. The proper system is, therefore, well fixed for low and high heads, while for the intermediate range between 300 and 600 ft. the correct type must be determined by comparing the unit speed characteristics.

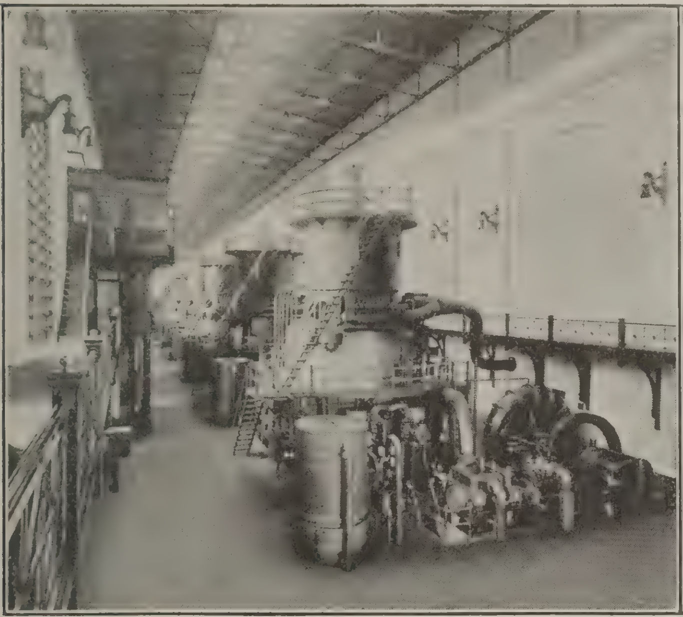
In determining the proper rating and capacity of the generators for a power station, both this machine and its prime mover must of necessity be treated as a combination so as to secure the highest operating efficiency. With steam engines the point of maximum efficiency is rather marked, and the ratings are usually such that the engine is working under its most economical load at the rating of the electrical generator. With gas engines, however, the efficiency increases with the load beyond the capacity of the machine, and for this reason the rating of such an engine is generally made as nearly as possible to its maximum capacity with only a small margin for regulating purposes. With steam turbines the efficiency curve is almost flat so that it is a question of desirable overload capacity which limits the rating of the turbine. In the waterwheel unit, the efficiency usually falls off rapidly above and below the maximum point, so that the rating of the generator should correspond to the point of maximum efficiency of the wheel.

The number and size of the units are usually indicated by some condition in the proposition. When this is not the case the load factor, the nature of the load, the reserve capacity, the reliability and flexibility of the service should be most carefully considered. For this reason single units are never desirable, except for multiple-plant systems, in which case the necessary reserve can be obtained from other stations.

The effect of the power factor should also be considered when determining the prime mover as well as the generator capacity. Many mistakes have been made in this respect. The generator may, for example, have been designed and rated on the basis of unity power factor operation with a prime mover having a corresponding capacity. After installation it may be found that the actual operating power factor is 0.80, with the result that only 80 per cent. of the prime-mover capacity can be utilized without overloading the generator.

Most alternating-current generators are wound three-phase with the armature windings connected in star. This is preferable to delta connection, as a smaller number of conductors is required for a given voltage, while on the other hand the danger of the circulation of triple-frequency currents in the closed armature winding is avoided.

Whether the generator neutral should be grounded or not depends on the operating conditions. If an uninterrupted service is the most essential consideration, the system should not be grounded, while if it is more desirable to limit the voltage stresses, it may be advisable to ground the neutral, thus limiting the stress to the Y-voltage. Grounding may also be advisable where selective action is desired on a number of outgoing feeders, especially underground, so that individual conductors may be disconnected even in the case of grounds.



Interior of a Large Steam-Driven Power Station

Interior of a Large Hydro-Electric Power Plant

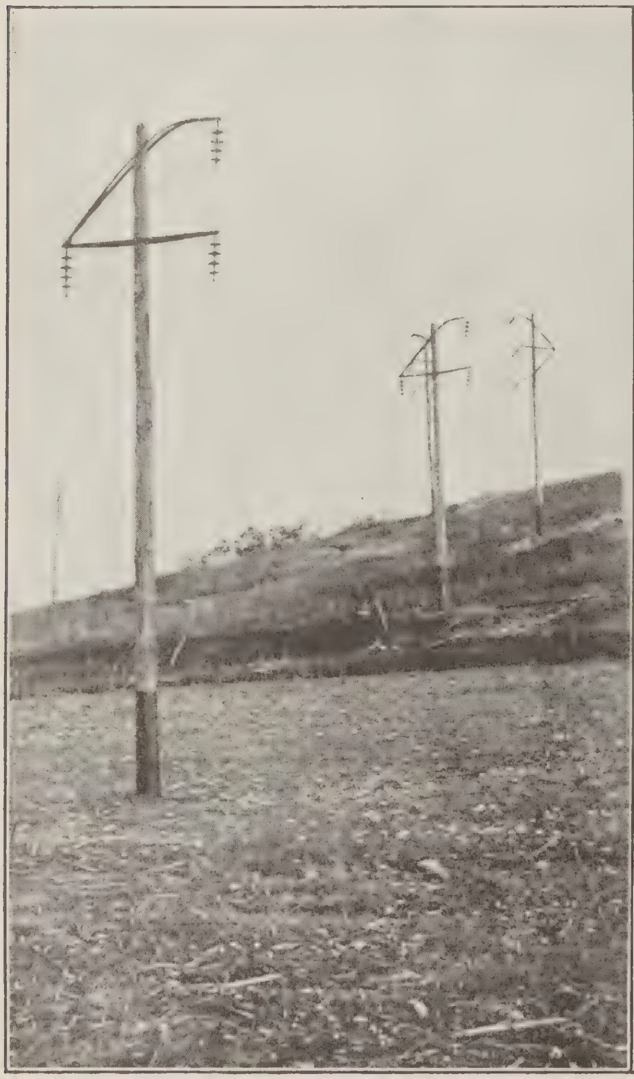
In transmission systems with one or two lines except for extreme voltages the isolated system seems to be the most favored. The apparatus must therefore be designed to withstand the full delta-voltage. If this is not advisable the neutral must be dead-grounded; but in this case the mechanical design of the apparatus must be such that it can safely withstand the stresses due to frequent short-circuits which occur when grounds take place.

Generators May Be Grounded through Resistance

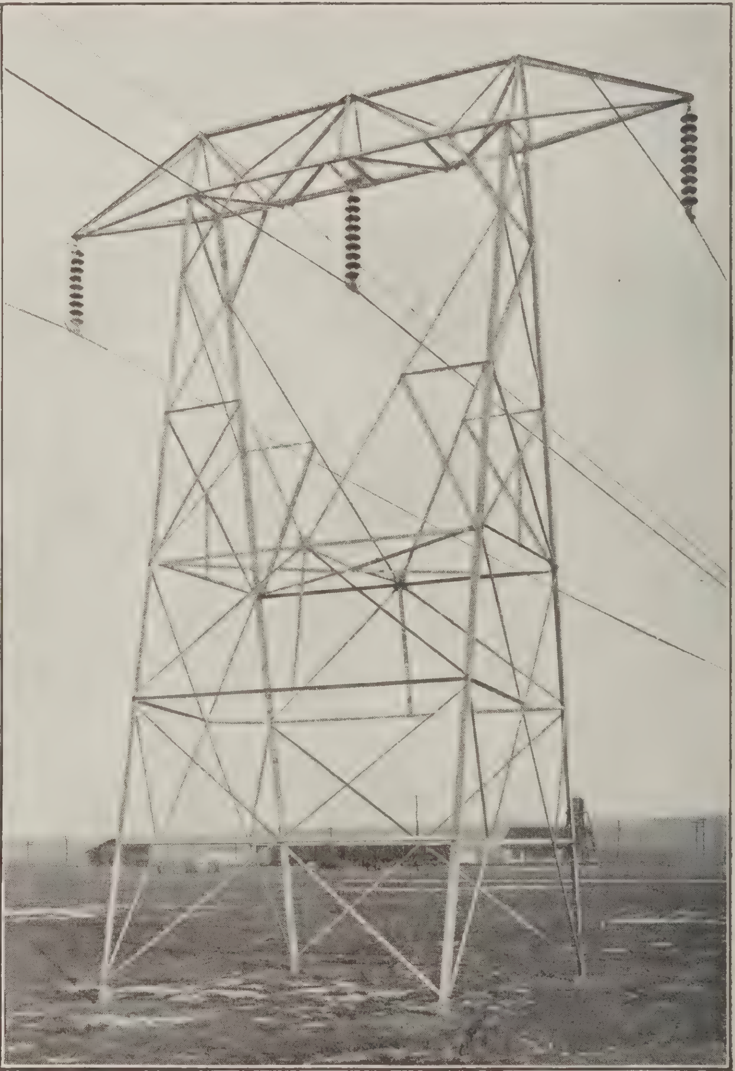
If the grounding is done to insure selective action of feeders, it may be advisable to ground the generators through a resistance. In this case, however, the voltage strain is not limited to the Y-voltage and this must be given due consideration. The resistance should have a value high enough to limit the neutral current, but still low enough to insure that, if a ground occurs in one phase, it will permit a sufficiently large current to flow in the neutral to open the protective circuit-breakers.

Non-inductive resistances are preferable to reactances, since they eliminate the danger of high-frequency oscillations between line and ground through the generator reactance in the path of the third harmonic, by damping the oscillation in resistance. The grounding of the neutral through a resistance may therefore be dangerous, owing to the possibilities of a resonance voltage rise.

Close inherent voltage regulation requires a low reactance, which means an expensive machine. This is possibly not as important as the fact that a low-reactance machine, in case of short-circuits, allows a heavy current to flow through the machine and through any other apparatus that may be within the circuit inclosed by the short-circuit. The mechanical stresses set up by these short-circuit currents, which reach enormous values in large concentrated central stations, are liable to severely damage the apparatus, and in order to reduce the currents to safe values large reactances are necessary.



A 66,000-Volt Transmission Line with Wishbone Cross-Arms



Steel Tower on a 15,000-Volt Transmission Line

External Reactances Are Usually Provided

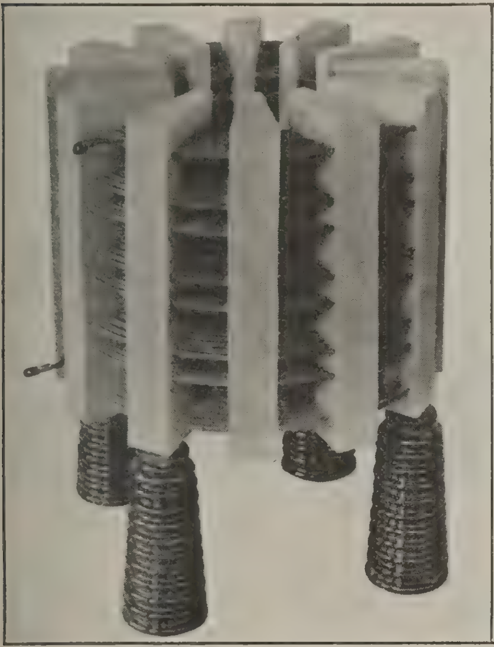
It is not possible to design high-speed turbo-generators for the necessary reactance, and external reactances must usually be provided and inserted in the generator leads or between the bus sections. By so limiting the abnormal flow of current into a short-circuit the generating system as a whole is relieved from their disastrous effects.

Not the least important part of the generating station is the exciter system, many more or less satisfactory combinations being possible.

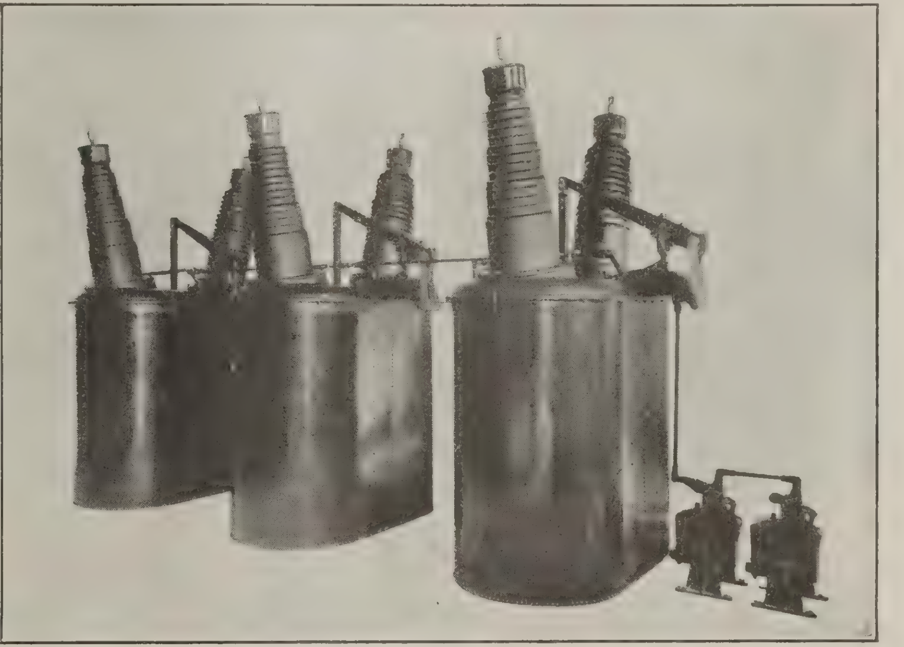
The exciters should have a capacity sufficient for all of the synchronous apparatus in the station when these machines are working at their maximum load and true operating power factor. It is not enough to provide for the excitation when running at unity power-factor, because the excitation which is required at lower power-factors is considerably higher than at unity power-factor.

For small and medium-size plants a 125-volt exciter pressure is generally chosen, while for larger installations a 250-volt excitation will prove more economical.

Although many systems of excitation are in use the one which seems to be the most widely employed and which offers the greatest reliability is that in which the exciting current is obtained from a common source, consisting of as few machines as possible. One or two units are then generally provided for normal excitation, a third being installed as a reserve. It is also common practice to have the regular exciters driven by prime movers, such as steam engines or waterwheels, while the reserve unit is motor driven.



A Current-Limiting Reactance



A Triple-Pole Solenoid-Operated Oil Switch

Still another system which is becoming quite common is to install low-voltage generators, driven either by a non-condensing steam turbine or a waterwheel. The exciters are then motor driven, current therefor being obtained from the low-voltage generator. The steam from the turbines is exhausted to the feed-water heaters. In addition to the exciters all the other auxiliaries, such as circulating pumps, etc., are also motor driven.

In order to insure a close voltage regulation of the system automatic regulators are almost always installed in connection with the exciters. These maintain a constant a.c. busbar voltage regardless of the load.

For low- and moderate-voltage installations it is the general practice to install one transformer bank for each generating unit and of the same capacity. For high-voltage transmission systems, the transformer should form a unit with the transmission lines, i.e., the number of groups or banks should be equal to the number of lines. In this manner all high-tension switching, which is highly objectionable, can be avoided, and the same done on the low-tension side of the transformers.

The transformers may be either of the single-phase or three-phase type, and no specific rule can be given regarding the choice, this being usually governed by local conditions. Single-phase transformers are preferable where only one group is installed and where the expense of a spare is unwarranted. In such installations the burning out of one phase of a three-phase unit causes considerable inconvenience, since the whole transformer would have to be disconnected before repairs could be made. If single-phase transformers are used and connected delta on both primary and secondary, the damaged unit can be readily cut out and the other two operated with normal temperature at 58 per cent. of the normal capacity of the group until the damaged unit can be replaced.

With a three-phase, shell-type transformer, if both the primary and secondary windings are delta-connected, trouble in one phase will not prevent the use of the other two in open delta. By short-circuiting both the primary and secondary of the damaged phase and cutting it out of the circuit, the magnetic flux in that section is entirely neutralized.

Three-phase transformers may be used in moderate voltage installations with a large number of units. For high-voltage developments, where the transformer banks should be of equal capacity to the lines, it is, however, usually necessary to select single-phase transformers so as to obtain the required capacity, and also reduce the cost of the spare unit.

According to the method used in dissipating the heat generated by the losses, transformers may be classified as oil-cooled, water-cooled and air-blast.

In the oil- or self-cooled types the oil heated by contact with the exposed core and windings rises to the surface, flows outward and descends along the transformer case, from which the heat is radiated into the air. The tanks of self-cooled transformers are therefore usually made of corrugated sheet steel to give a greater radiating surface. This type of transformer is the one most generally used.

Where water is available for cooling purposes, the water-cooled transformer is the variety most economical to install. In this type the oil circulates in a manner similar to that in the self-cooled type, but the bulk of the heat is carried away by water forced through a pipe coil submerged in the hottest oil at the top of the transformer. Ordinarily the water rate is approximately one-half gallon per minute per kilowatt loss, the temperature of the incoming water being 59 deg. F.

In the air-blast transformer type the cooling is effected by a forced draft of air which is directed through spaces provided between the coils and in the core structure. This class of transformer is applicable for voltages up to about 33,000, but it is being rapidly superseded by the self-cooled type.

The System of Connections Is Important

The system of connections and the switching equipment have a most important bearing on the successful operation of any power installation. When laying out the same the first consideration should be reliability and continuity of operation, while at the same time economy must not be lost sight of.

By carefully planning the connections and by providing switches with selective devices at certain points it is possible to reduce the interruptions to a minimum without exceeding economical limits.

The engineering problems involved in this phase of the subject are rather complicated and differ considerably, depending on the type of installation. As a rule, generators should be paralleled on a low-tension bus, which should be sectionalized if their total capacity exceeds the safe rupturing capacity of the switches. In certain stations no paralleling bus is provided, but simply a transfer bus of light dimensions.

For moderate-voltage stations the step-up transformers, if such are present, are usually also paralleled on the high-voltage side, while for systems employing extreme potentials the different transformer banks should form a part of the line and not be paralleled on the high-tension side, as previously mentioned.

The generator switches, which are installed in the leads between the generators and the low-tension bus, are as a rule of the non-automatic type. As synchronous generators are capable of operating under short-circuit conditions for a limited time, it is considered better to have the operator disconnect a defective unit rather than to have all the machines in the station cut out of service in case of damage to one unit or a short-circuit in the low-tension switch structure.

In certain stations the generator switches are equipped with reverse power relays, in which case a damaged generator would be immediately disconnected from the system through the reversal of the current in its leads.

The transformer and feeder switches should be provided with automatic oil switches, the relays being so chosen that a selective action is obtained, i.e., so that a damaged section may be cut out without disturbing the rest of the system. When deciding on the proper switch and relay equipment for a power system it must be understood that this involves a complete study not only of the generating station but of the operating condition of the entire installation, including transmission lines and substations.

A 60,000-Kw. 110,000-Volt Outdoor Substation

High-Voltage Outdoor Lightning Arresters and Wall-Entrance Bushings

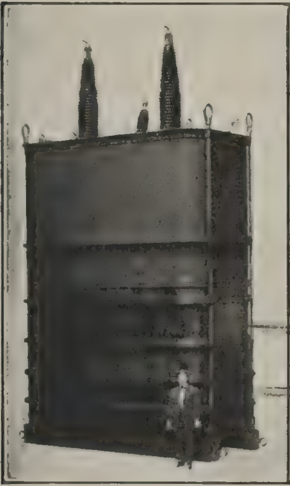
The switching equipment may for convenience be divided in two parts—the switch structure and the control board. This refers particularly to larger stations where the switches are electrically operated and located some distance from the board. For small and even moderate-sized stations it is a common practice to install hand-operated oil switches, which are mounted directly on the back of the switchboard or on a separate framework and operated by hand by means of levers located on the front of the switchboard panels.

In selecting the switches it is not sufficient that they have the proper current-carrying capacity and can withstand the operating voltage. Equally important is their rupturing capacity, i.e., their design must be such that they can safely withstand the effects of the total power which they may be called on to rupture.

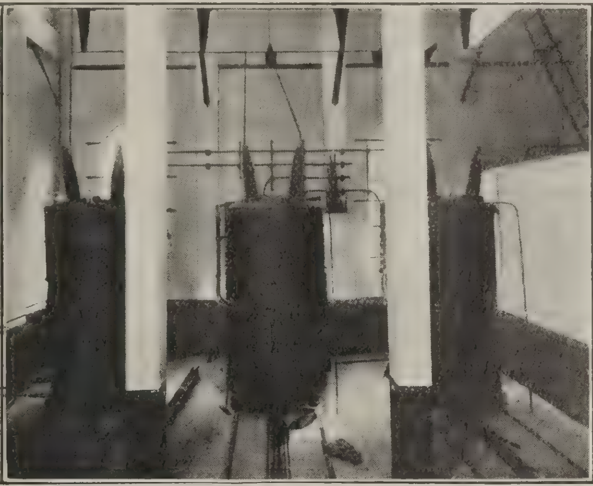
The switch and busbar structure may be either of the inclosed or open type, but is usually a combination of the two. It is generally found advisable to inclose all live parts when the voltage is below 22,000. This is due to the fact that the destructive effect of short-circuits depends on the amount of current and is thus inversely proportional to the voltage for the same amount of power. For this reason the low-tension apparatus and busbars in large power stations are generally inclosed in compartments, while their high-tension counterparts are of the open type.

The switch and busbar compartments may be built of brick or concrete, the latter material being almost exclusively used nowadays. For oil switch and busbar structures it is preferable to use brick on account of its greater strength and adaptability to the special forms of compartments and narrow barriers used for this apparatus.

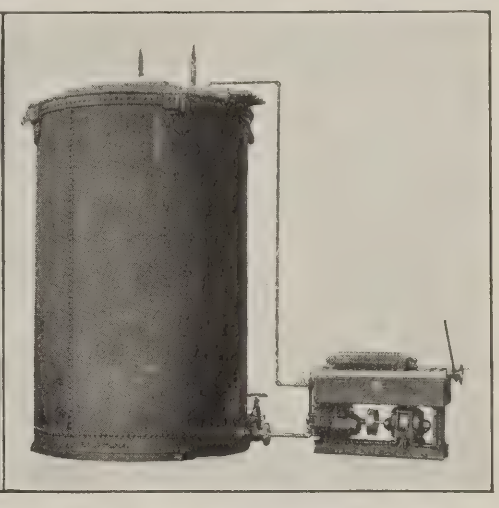
Low-tension busses are generally built up of laminations in the form of flat copper bars. This is the most economical construction since it insures a better radiation of the heat and can be tapered toward the ends where a small cross-section is sufficient. Furthermore the size can readily be increased as extensions are made to the plant. The high-tension bus, however, is almost always made of iron or copper tubing supported on post or suspension insulators.



A 4500-Kv.-a. 750,000-Volt Transformer



A Bank of Three 10,000-Kw. 110,000-Volt Transformers



An Oil Drier and Filter Drying Oil in an Operating Transformer

Every switchboard is, of course, special to a certain extent, as the conditions are seldom alike in different stations. The control board of a large station is strictly not a switchboard in the original sense of the word, as all the oil switches are located remote from it, being merely controlled therefrom. Upon the panels are mounted only the control switches and instruments. These should be arranged carefully, taking into consideration all the operating conditions. For this reason the board is divided up in panels corresponding to the machinery which it controls. The exciter and regulator panels are generally located at one end, then the generator, station, transformer and outgoing line panels in the order mentioned. This arrangement may, of course, be varied so as to more closely correspond to the arrangement of the apparatus.

Two different varieties of construction are customary, namely, the panel and the benchboard types. The panel type is mostly used in small- and medium-sized plants where the switches are located on pipework or in cells in the rear of the board, but near enough so that they can be operated by providing connecting-rods between the handles on the panels and the switches. In certain instances, this type of board is also used where the switches are electrically operated.

BENCHBOARDS PREFERRED IN LARGE STATIONS

The benchboard construction is the one generally used in large modern stations, as it provides the most compact layout, reducing the length of the board to a minimum. The instruments and meters are then mounted on the vertical panels, while the control switches, indicating lamp, receptacles, etc., are placed on the bench top.

A complete record of the operation of the various units in the station is of the greatest importance, and the instrument equipment should therefore be as complete as possible. Considerable misjudgment is, however, often exhibited in its selection, and the following recommendations may therefore prove useful:

For the exciters provide one ammeter and one voltmeter. If there is more than one exciter, a common voltmeter may be used. This should be mounted on a swinging bracket at the end of the board, and a two-point potential receptacle placed on the panels for each exciter.

Where these machines are driven by induction motors an ammeter should be provided for reading the current taken. The equipment for a synchronous motor when started from the a.c. side should include: One ammeter, one field ammeter, one polyphase indicating wattmeter; this latter may however be omitted.

For generators provide: Three ammeters, one polyphase indicating wattmeter, one voltmeter, one field ammeter, one four-point synchronizing receptacle, one eight-point voltmeter receptacle.

As all three-phase systems are more or less unbalanced, it is preferable if an ammeter is provided for each phase. In small installations one ammeter may be installed and a plug and receptacle provided so that the instrument can be connected to any one phase and the current read.

Indicating wattmeters are important, as it is not possible to determine by any other means the division of load between two alternating-current generators running in multiple. The ammeters do not differentiate between the idle current and the line current from the machines, and thus are of no use in determining the division of the load. In large stations it may also be advisable to provide a polyphase watt-hour meter for registering the amount of power which is generated.

Field ammeters are useful, but not absolutely necessary. They serve as a check on the generator in case of trouble, and are invaluable in testing therefor.

Voltmeters are, of course, used to read the voltage of the machine before it is connected in multiple with any other. They are also used to indicate the potential of the buses, and the eight-point receptacle is to connect the voltmeter to any of the phases.

The synchronizing receptacle is used to connect the generator to the buses leading to the synchronizing indicator. It is preferable to synchronize between machines and not between a machine and a bus. For this reason two plugs must be provided, one for "starting" and the other for "running," i.e., when sychronizing, the starting plug is inserted in the receptacle of the machine to be started, while the running plug is inserted in the receptacle of one of the operating machines. The synchronism indicator will then show whether the incoming machine is running too slow or too fast.

The station panel equipment should consist of one synchroscope, one power-factor indicator, one curve-drawing voltmeter.

In certain installations it may be advantageous to provide an indicating voltmeter permanently connected to the bus. A better comparison can thus be made between the bus and generator voltage when synchronizing. A curve-drawing voltmeter giving a continuous record of the bus pressure is of great value and in certain installations the importance of the service may be such that it is advisable to provide frequency and power factor indicators of the curve-drawing type.

Station feeders should be provided with: One ammeter with plug for reading current in either phase, one polyphase watt-hour meter (in large stations).

One ammeter may be provided in the low-tension circuit of each transformer bank. Outgoing lines are generally provided with three ammeters. These are usually of the series type, mounted on post insulators and located at a convenient point in the high-tension structure.

The electrical disturbances common with electric power developments may be divided into two general classes; first, those caused by excessive currents, and, second, those caused by high voltages.

Maximum Temperature Attained by Machine Determines Safe Load

The safe load which a machine can carry is determined by the maximum temperature which its insulation can withstand, and while machines as a rule are able to carry considerable overloads for a certain period, if this is greatly exceeded the insulation will rapidly deteriorate, resulting in a burn-out. For protecting apparatus against undue overloads of this kind automatic switches are provided in their circuits.

The excessive currents which are caused by short-circuits may reach high momentary values, and result in severe stresses being imposed upon the apparatus, which in turn may result in a failure of the insulation and a complete shut-down of the damaged apparatus if not the entire system. With the present tendency to concentrate large amounts of power, it is evident that the effects of a short-circuit may prove to be disastrous, and that means must be provided to limit current rushes to a safe value. On the other hand the system should be so sectionalized that the damaged part may be quickly isolated.

The most common method of reducing short-circuit currents is by introducing artificial reactance coils in the various circuits. These may be placed in the generator leads, in the low-tension transformer leads, between the busbar sections or in the outgoing feeders, the particular location being dependent upon the type of installation.

Devices for Reducing Short-Circuit Currents

Various schemes have also been devised for automatically reducing the value of the current which the generators are capable of delivering under short-circuit conditions. As almost all modern generators are controlled by automatic voltage regulators the tendency of these would be to hold up the voltage when a short-circuit occurs, but means are now often introduced which will result in a lowering of the generator voltage under such conditions.

High-voltage disturbances may, also, be divided into two classes; first, those covering actual high voltages in which the excess potential exists between phase conductors or between phase conductors and ground; and, second, localized high voltages which take place in the transformer windings, being caused by high-frequency impulses or traveling waves which are set up somewhere along the transmission lines. For guarding against the former class the aluminum cell electrolytic lightning arrester possesses ideal characteristics and is extensively employed, giving satisfactory protection.

Overhead ground wires are also used to a great extent to protect the transmission lines against static discharges, and in this connection it might be stated that a lighning arrester is not intended to protect the transmission lines but only the station apparatus, and while they could, of course, be installed and distributed along the lines, such a scheme would prove entirely impossible from a commercial viewpoint, for which reason ground wires are employed.

For protection against the second class of high-voltage disturbances, which are caused by high-frequency impulses, no satisfactory remedy has as yet been found. Extensive research work to devise such means is now being carried on and there is every indication that in the near future high-voltage disturbances can be guarded against in just as satisfactory a manner as are the disturbances caused by excessive currents.

⁂

Plant of the Alba-Melakoff Lignite Co. in Texas

Special Correspondence

This company has a well equipped plant, with modern machinery. The employees are nearly all Mexicans, this nationality appearing to be the most plentiful in that part of the country. They seem to make very good miners, with the exception that they do not like regularity.

The coal is at present being hauled by mules, but the company expects to install cable or motor haulage in the near future. The seam is 6 ft. in thickness and is worked on the block system, a total of 400 tons per day, of a very fine grade of lignite, being taken from the mine, on a four days per week basis. This time last year the company was working full time and could not supply the demand. The cotton situation in the Southwest has hurt the lignite mining business, as it has almost all other classes of labor. The average miner receives $2.75 per day, while some of the best men make as high as $5 a day. A breast auger is used for drilling and black powder for shooting purposes.

The How and Why of the Condenser

By H. E. Beyer*

SYNOPSIS—The usual method of calculating the efficiency of a condenser is to compare the actual vacuum attained with that theoretically possible. The ratio of the vacuum and hotwell temperatures tells a different story.

It is the purpose of this paper to describe the underlying principles entering into the theory of economical condensation of steam and vapor by means of the jet condenser.

In order that the description may be more clear it might be well to preface it by the statement that a condenser is a heat transferring apparatus, being the reverse in its action of the steam boiler. The boiler generates steam; the condenser destroys it. And as transfer of heat naturally involves temperature change it may be said that the efficiency of the operation of transferring exhaust steam into hotwell water may be best ascertained by means of the thermometer.

The reason why temperatures are not more commonly used as the basis, is probably due to custom and prejudice. When Thomas Newcomen brought out his atmospheric engine in 1705 and which in reality was a steam condenser (the steam was admitted into a cylinder and then water introduced to condense it, the pressure of the atmosphere forcing the piston into the vacuum thus formed) thermometers were not available as they now are. Gages of the water or mercury column type were more accurate with the facilities of manufacture then existing, with the result that in the early days of steam engineering the practice was evolved of measuring in inches and in pounds; and because the present day science of steam engineering has been built on such measurements, this practice has been continued in condenser work.

But it would seem a useless procedure with the modern ability to manufacture thermometers which will fulfill the requirements of ordinary accuracy, that we should go to the trouble of transferring gage readings expressed in vacuum inches or in pounds absolute, correcting them for the local barometer, and then reduce them to temperatures in order to ascertain how efficiently a condenser is working when it is much more direct to take the temperatures of the inlet and outlet water and of the exhaust steam. These three readings give all the data necessary to ascertain how efficiently the condenser is working.

If for example we know that cooling water enters a condenser at 90 deg. F., that the exhaust steam has a temperature of 115 deg. F., corresponding to 27 in. of vacuum, and that the hot well water has a temperature of 113 deg. F., we know we have an efficient machine. If the waste water leaves at a temperature of 105 deg. F. we know that we have not; the amount of cooling water required with the latter condition being somewhat over 50 per cent. more than is required in the first case. So it would seem that the terminal difference actually carried between hot-well and exhaust steam temperatures should be the measure of efficiency, and the basis on which condenser guarantees should be determined.

As is evident from the above, the temperature of the hot-well water has a direct bearing on the part the steam in the condenser plays in the process of its destruction. If the rejected hot water is heated up to the temperature corresponding to that of the exhaust pipe, it shows that the steam has been deprived of all its heat, and therefore having ceased to exist can exert no pressure in the condenser. In other words, the efficiency represented would be 100 per cent.; and as most condensers in use today operate on a basis of more like 50 per cent. efficiency there must be a reason, and this reason is the air present in exhaust steam and cooling water.

Air is noncondensable, and the action of the cooling water is to disintegrate the mixture of air and steam. The more air there is in the cooling water the less its ability to properly disintegrate the steam and its air, and the less air there is in the cooling water the greater its ability to do so. So it is evident that cooling water, freed of air, will insure the highest efficiency of heat transfer occurring in the condensing process.

Most condensers put on the market and in use do not free the cooling water of air before the water mixes with the steam, and the result is a low efficiency of heat transfer. Not only must sufficient cooling water be supplied the condenser to absorb the heat of the entering steam, but an additional amount must be furnished to cool the air in the water itself, as otherwise this air would be so expanded in volume by contact with the steam, as to seriously impair the vacuum.

That is why jet condensers which depend upon a throat or water pump to carry off the mixture of hot water and air always give a low vacuum when the temperature of the cooling water is raised or the amount of water is cut down.

To relieve this condition resort is sometimes had to air pumps, but the addition of an air pump to a condenser which does not free its cooling water of air before it comes into contact with the steam gives relief mainly during the summer time when the cooling water gets hot; in winter when the water is colder as good a vacuum can generally be obtained without the pump as with it.

The efficiency of 50 per cent. in regard to heat transfer applies to condensers which come under the group classified in the art as "parallel-current," as contrasted to the type known as "counter-current." Counter-current condensers remove the air from cooling water before it comes in contact with the steam, rendering possible a much higher efficiency of heat transfer. Properly designed counter-current condensers will operate on a 2-deg. terminal difference and their efficiency of heat transfer will range from 90 per cent. to 98 per cent. Knowing this it may seem strange that the majority of condensers in use should not be of the latter type rather than the former.

Until recent years little attention has been paid to the efficiency of condensers because of the low vacuua deemed necessary. The cooling water formerly available was colder and purer than at present due to fewer steam plants in any given territory, so that with such conditions almost any old thing would do as a condenser. The large increase in the number of condensing power plants in every locality which frequently, by their re-use of river water as an instance, has changed operating conditions, so that now hot cooling water, frequently foul, and carrying much foreign material is the rule. This coupled with the higher vacuua required by modern steam practice demands a more fool-proof and efficient condenser. This demand is being met by the use of the counter-current type of condensing apparatus.

---

*Condenser engineer, Cresson-Morris Co., Philadelphia, Penn.

NOTE—A paper read before the Alabama Light and Traction Association.

In a counter-current jet condenser the cooling water enters at a point above the steam entry. Low velocity of mixing is employed, the steam entering at from 200 to 400 ft. per second, as contrasted to 700 to 1000 ft. in the parallel-current type. The water is allowed to drop from a position of rest so that its velocity is due only to the pull of gravity. This ensures thorough mixing. To remove the air and noncondensible gases a dry air pump is necessarily used. This machine takes the air from a point well above the cooling water entry.

This arrangement means that the water entering the condenser is immediately freed of its air content, in proportion to the vacuum. The cooling water relieved of this air and with the slow mixing process employed can then absorb to its full ability the latent heat of the entering steam, and can also more effectively cool the hot air released from the steam and which passes up through the falling water to the point where the air pump removes it from the condenser.

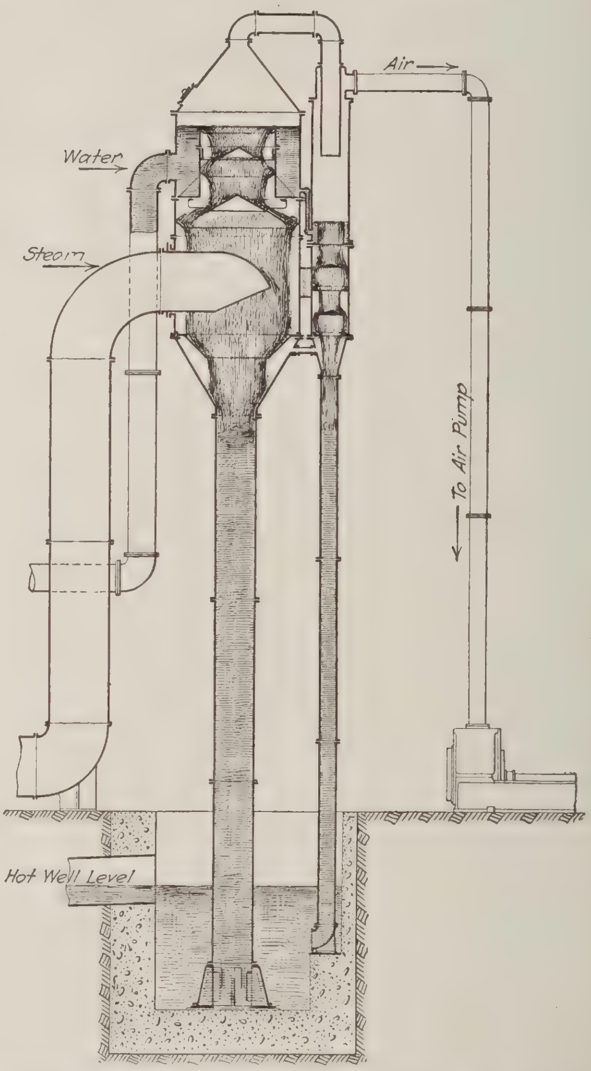
As the hot water running off is at the extreme bottom of the condenser, and the air practically cooled to the temperature of the incoming cold water, is at the extreme top, a high efficiency of heat transfer can be obtained. Further, the air passing to the air pump being cooled to the lowest possible point, it will be correspondingly dense, so that the power required to remove it from the condenser will be the minimum. High efficiency of heat transfer means a small amount of cooling water required, and the combined horsepower of the air and water pumps will be the lowest possible.

On reliable tests a counter-current barometric condenser handling the exhaust steam from a 5000-kw. turbine has required but $\frac{9}{10}$ of one per cent. of the power of the main unit when maintaining 28 in. of vacuum with 65 deg. temperature of cooling water at full load. On smaller units of course, this ratio is higher, but even with 500-kw. machines 2 per cent. should be a fair average.

While reference has been made to the slow mixing process employed in counter current condensation, it is equally essential to have the air removed from the condenser top at a slow velocity and that the hot water running off does the same. This means large air and tail pipes at top and bottom respectively; and in the case of the low level type of condenser large diameter below the steam nozzle. There should be no siphonic effect at the bottom due to velocity of water flow at that point.

Coming to the practical side of the matter, it will be found that an air pump taking air out of a counter current condenser without the medium of a suitable water separator, will constantly be troubled with water in the cylinder due to the condensation of the moisture content of the air. The air leaving the condenser is saturated and as it gets cooled on its way to the pump it drops its moisture content. This water trouble is effectively prevented by means of a simple separator which changes the direction of the air so as to shake the moisture out by the time it enters the suction pipe between condenser and pump.

In the same way, it is necessary to lead the exhaust steam into the center of the condensing space so that the cooling water forms a complete cloak or umbrella, in the center of which the steam is delivered. The steam then blows out against this water and all the water required per unit of time meets all the steam entering during the same period, so that there is no wire drawing.



Cross-Section of a Counter-Current Barometric Condenser

In addition to the feature of high efficiency, there is a most practical advantage derived from the above construction, in that the condenser will not clog up due to any rocks, wood, fish, grass or other foreign material which may enter with the cooling water. There are no springs to adjust; no contracted passages in the interior, and the condensing vessel itself needs no more attention than the exhaust pipe. The air pump can be placed at any convenient location, and in the same way the condenser can be put at any desired distance from the engine or turbine. It is also possible to have one condenser handling the exhaust from several prime movers. Last year there was installed a 15,000-hp. condenser for a large steel plant, which has 1500 ft. of exhaust piping leading to it.

Having explained the operation of the counter-current condenser and expressed the opinion that the thermometer is the proper means of recording what the condenser is doing, it may be interesting to give a comparison between this and the method generally employed by engineers This method expresses efficiency by the per cent. of ideal perfect vacuum actually obtained, and neglects the operation of heat transfer entirely. If the hot-well for instance has a temperature of 79 deg. F., the corresponding vacuum is 29 in. If the vacuum observed is 28.62 then according to this method the efficiency would be $\frac{28.62}{29} = 98.6$ per cent., and this reading would show that the condenser was doing pretty good work. An examination of the heat transfer process however shows that this is quite the reverse, and a comparison is given below, the figures being taken from actual reported tests published by the builders.

	Counter-Current	Parallel Current
Temp. cold well	66 deg.	65 deg.
Observed vacuum	28.62 in.	28.62 in.
Temp. of vacuum	89 deg.	89 deg.
Temp. hot-well	87 deg.	79 deg.
Temp. difference	2 deg.	10 deg.
Per cent. ideal vacuum realized	99.7	98.6
Latent heat per lb. steam at vacuum..	1043.69	1051.66
Lb. water actually required per lb. steam	49.7	75.1
Lb. water theoretically required per lb. steam for 100% efficiency...........	45.3	43.4
Efficiency heat transfer	91%	58%

The above comparison shows that by the method of figuring efficiency on the ideal vacuum basis that a condenser operating on a 10-deg. difference is apparently as good as one working on a 2-deg. difference; but when we come to compare the same condition on the heat transfer basis we find that the 10-deg. terminal difference condenser uses 50 per cent. more water and has an efficiency of 60 per cent. as compared to that of 96 per cent. for the counter-current with a consequent increase in the power required to operate the auxiliaries.

⁂

Extracts from a Superintendent's Diary

I did a thing today which I have always said I would never do, and I am more than disgusted with myself for having done it; I addressed an open meeting of our miners' union and attempted to convince them that they could not justify the calling of a strike against our company at this time, no matter what the unions at the other camps in the state might recommend.

Over my desk hangs this bit of wisdom: "Never try to reason the prejudice out of a man—it is not reasoned into him, and cannot be reasoned out."

I haven't been able to get my eyes away from it since I came back from the meeting.

I realize now that my error was simply the result of allowing my enthusiasm to get the better of my judgment.

For a long time past I have been congratulating myself upon my success as a leader of men. It has seemed to me that I have been faithful to my convictions, and I have been able to impress my convictions on all who call me boss. I take my convictions seriously and have arrived at them only after much earnest deliberation. And not only have I been master of my men, but the higher officials of my company have usually come around to my way of thinking.

And now it appears that while I have been floating along in the clouds, my men have been taken in hand, secretly, by the national union officials and reminded of the great gap that exists between what they have accepted as satisfactory and what really ought to satisfy them.

It all came to the surface very quickly and in a way that could not be misunderstood, as soon as I threw down the bars at the meeting this afternoon.

"Loyalty to the company that has been loyal to you is all that we ask for" was the burden of my talk and they heard me through without an interruption. Then they began to ask questions, and such questions they were.

"Who were our directors?" "How did they make their money?" "Why did they organize our company after they had already accumulated so much money?" "Why did they not come to inspect their property in person?"

In my prepared speech I had intimated that local unions were led into all sorts of predicaments, principally, because the national organization was ruled by men living at a great distance who could not be in close touch with the local members. "How many of you know whether your national leaders are honest or are simply grafters like so many that have gone before them? Do you know enough about them to justify an opinion that they are not leading you into this course for selfish reasons?" was the way I put it.

My line of argument impressed them and they returned the compliment.

Little I knew about the personal history of our directors and everyone present soon realized that.

The effect of my embarrassment on my audience was magical; men who had never been known to question any act felt called upon to open fire and join in the general attack.

The president of the union, realizing no doubt that too much argument might react against his cause, got control of the meeting and brought it to a close.

And to think that during the past five years I have had that precept on prejudice hanging over my desk, staring straight into my eyes whenever those eyes were lifted from their work.

⁂

A Congressman on Feudalism

Congressman David J. Lewis of Maryland recently testified before the Federal Industrial Relations Commission as follows:

> A man can no longer own a coal mine as he owns his house and garden. Suppose a friend and I were to find 10,000 acres of coal lands in West Virginia. We ought to exploit the mines we would open for the good of society. We must take the miners out there and build them houses. This gives us the relation of landlord and tenant, as well as employer and employee. Then we may have to start commissary stores. This gives us a third relation. And also we may be obliged to supply the doctor, and perhaps even the saloon for our miners.
>
> Because of relations like these, if mine employees have trouble with their employer, the result to them is disastrous. It affects all their relations to life at once, except toward their wives and children. Not only their work, but their homes and their stores are gone, and it is inevitable that trouble arises when the employer tells the men to move out.
>
> The employer is not wholly to blame, for society has told him that the mine is his just as are his garden and cottage. But such relations are impossible in this country. They are a feudalism grosser than English history has ever shown. If all the country was in the same state, we should either cease to have private property or the Republic itself would perish.

The Stoker in Coal-Mine Power Plants

By Alfred Lotz*

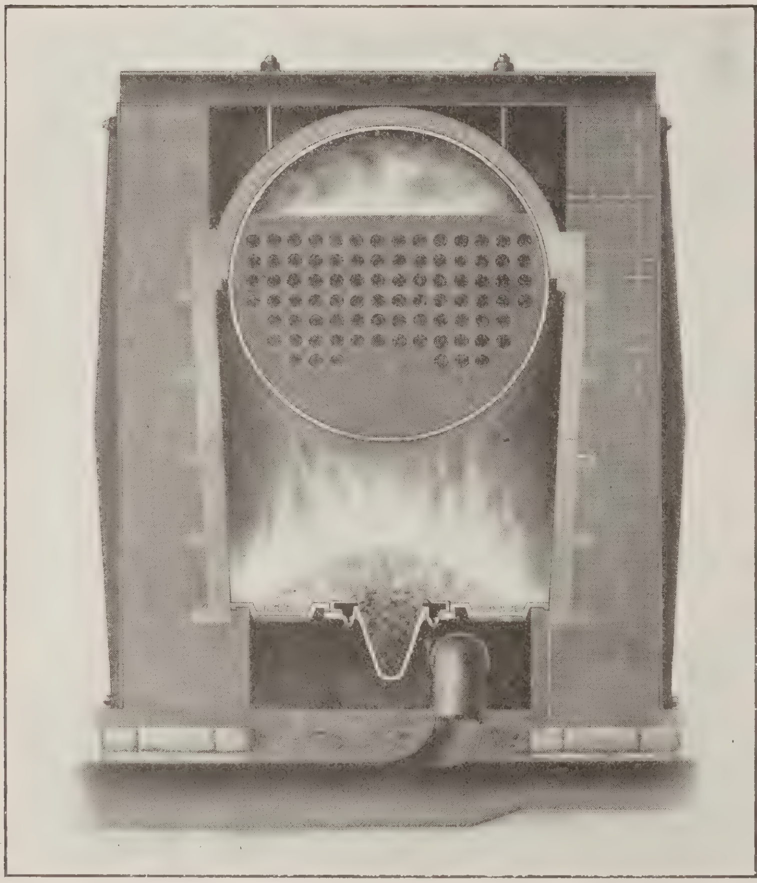
SYNOPSIS—True conservation applies alike to the production and utilization of any natural resource. By means of proper equipment the producers of coal can make use of low-grade fuel, thereby releasing to the market a salable product.

For many years past, numerous articles have appeared in the various trade journals dealing with the waste of our natural resources, the inefficiency with which the same have been handled, and calling attention to modern methods whereby various materials may be utilized with greater economy, thereby helping in a measure to conserve these natural products by using less of them per unit of output.

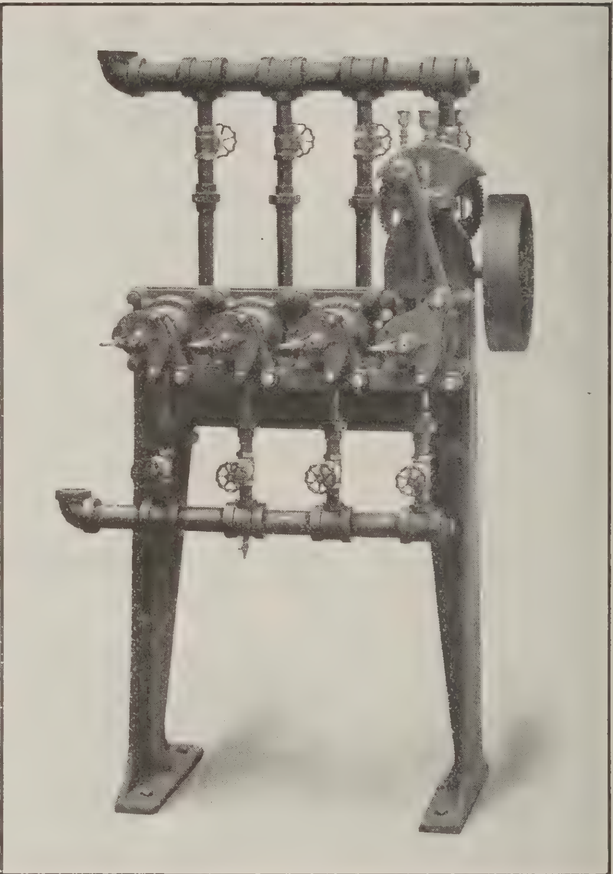
This is particularly true of coal, undoubtedly the most extensively used article of all our natural products, and until recent years probably the most wastefully handled, by large and small consumers alike, but particularly by the coal-mine operators themselves.

Of late years, however, both large and small power plant operators, who are paying out their good money for fuel, have come to the realization that they would be money ahead could they burn the coal more efficiently, cut down waste, and use less fuel per unit of output. Many have consequently resorted to mechanical stokers for this purpose.

This did not, however, apply to the coal-mine power plant except until recent years, principally because the fuel cost charged to the plant was that of mining, and as it costs just as much to mine poor coal as good coal, the latter was used in the plant instead of being sold at a profit, and the poorer grade, such as machine cuttings and slack, was dumped on the waste pile, there being no market for this material. Because of the prevailing opinion that low-grade fuel could not be utilized or that it would not pay to burn it, mines all over the country accumulated thousands upon thousands of tons of what was presumably just "waste."



Cross-Section of Furnace, Showing Retort, Tuyere Blocks, Dead Plates, Etc.



A Cole Automatic Valve Controlling the Stoker

When, however, the purchasers became more critical as to quality and price, and the competition among producers waxed keener, some of the more progressive operators began to consider the possibility of utilizing this "waste," which possessed considerable heat value, and of remodeling their power plants with this end in view.

Fluctuating Load Is Encountered

Considering the character of the waste to be burned and the highly fluctuating load of a coal-mine power plant, it soon became evident that not every stoker would meet these requirements. On account of the high percentage of noncombustible matter in cuttings, "bony" coal, etc., the air spaces of the grates of some types of natural draft stokers become clogged. This would necessitate a larger number of boilers when burning this fuel in order to get the same amount of steam, while other conditions would not be materially changed from the old hand firing practice except for the automatic feeding of the fuel.

---

*Mechanical engineer, Under-Feed Stoker Co. of America, Chicago, Ill.

Another important point is that with natural draft stokers no better regulation can be obtained than with hand firing to take care of the highly fluctuating loads encountered in mining operations, and the only manner in which any approximation to a constant steam pressure is attained through hand regulation by the stoker attendant, who can change the stoker speed and manipulate the stack damper as the load fluctuates from heavy to light. This leaves the question of "steady steam" entirely to the "human equation," the same as with hand firing. All operators appreciate the fact that this is rather uncertain.

View in the Boiler Plant of the United States Coal & Coke Co., Gary, W. Va.

In the underfeed stoker using forced draft the objections cited above have been overcome. It is possible with such a stoker to utilize unmarketable coal, obtaining comparatively high efficiency and also secure an entirely automatic regulation of the fuel and air supplied to the furnace, by direct action of the steam pressure on an automatic regulating device, thereby eliminating the necessity of depending on the judgment of the fireman.

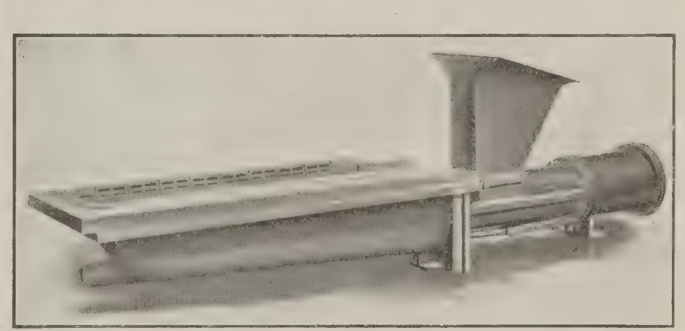
The Jones underfeed mechanical stoker has been successful in solving this very important question in coal mine power plants on account of its extremely simple construction and method of operation. It is entirely automatic in its control of the steam requirements of the plant, responding almost instantly to fluctuations in the load and being independent of the fireman in its operation. This is especially true where the fuel can be spouted to the stoker hoppers from overhead bunkers. Where there are no overhead bunkers the fuel must, of course, be shoveled into the hoppers by hand.

By referring to the illustrations it will be seen that the stoker consists of a steam-actuated piston connected to a ram which forces the coal coming down from the hopper above into a retort under the boiler. The steam cylinder, ram and hopper are located outside the boiler setting, while all else pertaining to the stoker proper is placed within the furnace.

Around the upper edge of the retort a number of air blocks or tuyeres are located. These connect to the chamber beneath the retort, which in this system is an air-tight compartment from which the air for combustion goes up through the tuyeres and mingles with the coke and gases distilled from the coal. The grate area in the furnace not taken up by the retort is completely filled with iron dead plates, which form the top of the air chamber.

An iron pusher rod with blocks or shoes, which is operated by the ram, is located in the bottom of the retort. This serves the purpose of giving an even distribution to the coal in the furnace. There are only two moving parts to the stoker proper, and these do not come in contact with the fire. No valves are employed on the stoker, the steam cylinder being connected to what is called a Cole automatic valve which gets its motion from the fan shaft by means of a belt connection.

The operation of the system is simple. The regulating valve between the steam line and engine driving the forced-draft fan is set to whatever pressure is to be carried on the boiler, and the Cole automatic valve is adjusted according to the quality of the coal to be burned.



The Stoker Proper, Showing Parts Internal and External to the Boiler Setting

Should there be little or no load on the boilers the engine, fan and Cole automatic valve will move only fast enough to keep the steam pressure at the desired point. Should the load be thrown on the boilers suddenly, the regulating valve will allow more steam to the engine, which will speed up accordingly, driving the fan at a greater speed, likewise the Cole automatic valve. This in turn operates the stoker faster, thus supplying the furnace with more coal and the proper amount of air to keep the steam pressure constant under the increased load. Should the load suddenly drop off the coal and air supply will decrease in proportion on account of the automatic slowing down of the entire system. Consequently no more coal is ever burned than is necessary.

There is no reason why coal operators should not practice the same rigid economy in their power plants that manufacturers follow in all other lines of business. If coal producers can profitably use in their boiler stations nonmarketable fuel, which would otherwise be wasted and thereby add to their merchantable output an amount equal to what they would have had to burn under ordinary conditions, obtaining a profit on the same, it stands to reason that they will be money ahead.

Unimportance of Power Questions in Jig Problems

By Geo. R. Delamater

The question may be raised as to whether capacity should not be considered in calculating the efficiency of each individual jig. It has been pointed out to me that some jigs will wash coal at the rate of 20, 30 or 40 tons per hour, while others will only handle 5, 10 or 15 tons in that time. My experience has been that jigs of high capacity are of large screen area. They may be of one compartment only, but in such cases are usually adapted only to fuels, which do not require to be crushed fine to attain the necessary breaking away of the impurities from the coal and in which the specific gravities of the impurities are much greater than that of the fuel.

They may be jigs of more than one compartment, in which case either one or two plungers are required for each compartment. The amount of water used on such jigs is practically of the same ratio to the amount of coal washed, regardless of the capacity of the jig. In fact I have always found that the amount of power required and the amount of water used are practically the same per ton of coal washed, regardless of the capacity of the jig. Again, two jigs of exactly the same design but of different sizes may operate at exactly the same cleaning efficiency. As an example, they may be the same machines throughout except that one has a width of 6 ft., while the other is 3 ft. wide. If the percentages of washed coal and their analyses are the same, the cleaning efficiencies are equal. In two machines of this kind a certain amount of the power required is consumed in overcoming the friction, etc., within the machines themselves and the larger machine probably uses little if any more power for this purpose than does the smaller one.

A considerable increase in power consumption by the larger machine will result from the increased amount of work done, and I have found that, within the rather limited extent of the variation in jig sizes to be found in actual practice, the reduction in the power consumption per ton of coal washed in the larger jigs over the smaller, is practically negligible. I, therefore, very seriously question the use of the jig-capacity figures as having any bearing on the efficiency of washing.

If the capacity figures are to be used at all, they should be reduced to the capacity per square foot of screen area of the jig, and even then, to use them in calculating efficiencies, some standard must be adopted representing 100 per cent. efficiency for one square foot. That to me seems practically impossible as all the other data obtainable for these calculations are based on float-and-sink tests. Besides this, any standard assumed for a square foot of screen area would necessarily be a variable depending on the size of the coal treated and the specific gravity of the materials constituting the raw coal.

After due consideration of these features of the problem it appears to me that the capacity of a jig settles down to a cost per ton of coal washed. The first consideration of every coal-washery owner, or intended owner, is the efficiency of cleaning the coal. If he could operate a jig at a capacity of 100 tons per hour at a cost of half a cent a ton, but at a cleaning efficiency of but 15 per cent., he would unquestionably be more interested in a jig that would clean his coal at a capacity of but 10 tons per hour at a cleaning efficiency of 95 per cent., even though the cost might be three, four, five or six times that of the other machine.

I, therefore, firmly believe that the capacity should play no part in the efficiency calculation except where there are several jigs of unequal output; then the efficiency of each jig may be multiplied by its output and the total of these products divided by the whole tonnage to find the average efficiency of the whole plant.

---

*Consulting engineer, Haddon Heights, N. J.

⁂

The Comparative Cost of Electrical Heating

By A. J. Weichardt

An interesting comparison of the cost of electrical heating versus coal heating is as follows:

One horsepower, or 33,000 ft.-lb., is equivalent to 746 watts, and 778 ft.-lb. are equal to one British thermal unit.

Expressed algebraically this is

$$\frac{746\ \textit{watts}}{\textit{minutes}} = \frac{33{,}000\ \textit{ft.-lb.}}{\textit{minutes}} \tag{1}$$

$$778\ \textit{ft.-lb.} = 1\ \textit{B.t.u.} \tag{2}$$

From (1) and (2)

$$\frac{1\ \textit{kw.}}{1\ \textit{kw.}} \times \frac{\textit{minute}}{\textit{hour}} = \frac{56.86\ \textit{B.t.u.}}{3411.6\ \textit{B.t.u.}} \tag{3}$$

Georges Creek, Pocahontas, or any good grade of bituminous coal will average from 14,000 to 14,500 B.t.u. per pound. Assuming, then, that the best grade of domestic coal has a heating value of 14,000 B.t.u., the results will be as shown in the accompanying table.

A consideration of the table shows that, with a furnace efficiency of 20 per cent., it is optional whether one pays ½c. per kw.-hr. for electrical heat or $8.20 per ton for coal.

At the more common price of 10c. per electrical unit, and using a steam boiler of 80 per cent. efficiency, one could afford to pay $656.58 for a ton of coal and come out even.

If it were possible to obtain a perfect furnace, $820.73 is the price that could be paid for a ton of coal in even competition with 10c. electrical heating.

If a Kw.-hr. Cost	The Equivalent Value of Coal per Ton of 2000 lb. for the Following Furnace Efficiencies Is:									
	100%	90%	80%	70%	60%	50%	40%	30%	20%	10%	5%
½c.	$41.03	$36.93	$32.82	$28.72	$24.62	$20.52	$16.41	$12.31	$8.20	$4.10	$2.05

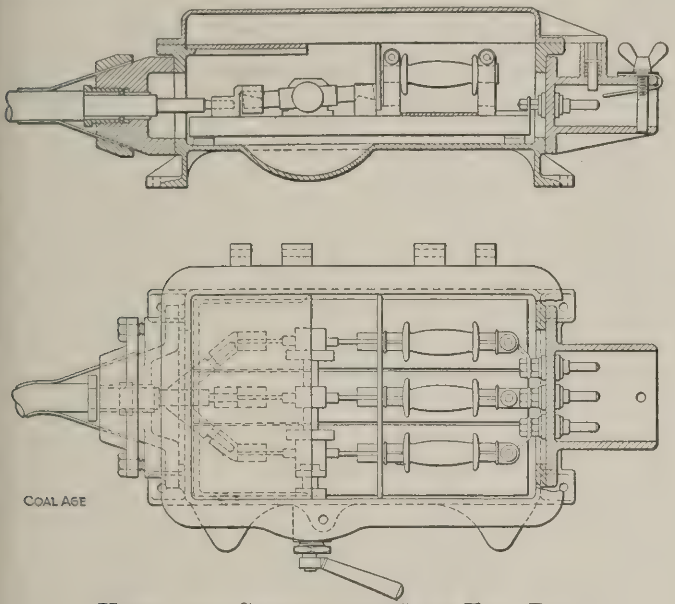
TABLE SHOWING THE RELATIVE COST OF HEATING BY ELECTRICITY AND BY THE BEST GRADES OF COAL WITH DIFFERENT FURNACE EFFICIENCIES

A Gate-End Switch Box

The accompanying illustration shows a gate-end switch box constructed by the Diamond Coal Cutter Co., of Wakefield, England, which has been standardized for 75 and 100 amp. at 550 volts, both as a single, two- and three-fold box. The drawing is practically self-explanatory.

The case is made of special high-tensile metal with side-flanged joints. These, together with the provision of cooling escapement glands, render the box explosion-proof. Interlocking devices prevent the possibility of switching on the circuit until the lid is closed or of opening the box while the current is on. Moreover, live contacts cannot be touched when the lid is open. The aluminum adaptor cannot be inserted or withdrawn when the switch is in the position and is automatically locked and a complete ground established before the current can pass.



View and Section of Gate-End Box

The fuses are contained in porcelain holders and the glands are made to suit the cables installed. The box can only be opened by the detachable handle, which is the key, and hence the switch may be claimed to be entirely fool-proof, owing to the practical impossibility of accidental misuse or shocks.

⁂

Coal, the Big Item in Power-Plant Operation

The largest single item in the operating costs of any steam power plant is coal. In most plants the purchase of coal is a matter of careful consideration, and in the larger ones it is usually bought under specifications. Once the coal is in the bunkers, this careful consideration stops and the actual burning of the coal is very rarely given more than a passing thought, as long as the steam pressure is kept up. Of course, there are some plants where this does not apply, but in the majority it does, says Power in its Feb. 2 issue.

The men employed are paid the lowest possible living wage and are chosen more on the basis of the wages they will work for than the results they are able to produce. The man who burns the coal can easily vary the efficiency of the boiler by 10 to 15 per cent., or the heat absorbed by 15 to 20 per cent., yet he is at the bottom of the payroll.

No revolutionary advancement has been made in power plants recently, and the increased efficiency is accomplished only by taking each process separately and bringing it up to the highest standard. It would therefore seem wise, in attempting to increase the overall efficiency of a plant, to start with the item that represents the largest expenditure and work down the list.

In office-building plants the cost of coal represents some 35 to 40 per cent. of the total expense, and boiler-room labor 12 to 15 per cent. In big plants the cost of coal is 50 to 55 per cent. and the boiler-room labor 7 to 8 per cent. Take a concrete case of a certain office building in New York City that employs two firemen at $600 a year each. Their coal costs approximately $10,000 a year. If we assume that the boiler efficiency is 60 per cent., and that by paying $900 a year men could be obtained who would operate the boilers at an efficiency of 70 per cent., it would be a paying investment. The increase in wages is $600 a year. The increase in boiler efficiency amounts to a reduction in coal burned of 14.3 per cent., or $1430. The net result is $830 to the good by the change—not a matter of philanthropy.

Any plant owner can figure out for himself what a small increase in the boiler efficiency will amount to in dollars and cents, and may find it profitable. The efficiency of the boilers may be increased in several ways, but first, proper equipment must be furnished. Every boiler plant should be equipped with a draft gage, stack thermometer and means for determining CO_2. The cost of this whole equipment need not exceed $100, which would be repaid in a very short time.

Then the firemen should be taught the use of this apparatus to determine the proper method of handling the fires to secure the highest efficiency. A bonus system for savings over a certain amount would probably be productive of the best result. If the firemen are able to save the plant money by their efforts, they should logically be entitled to a part of it.

⁂

Generally speaking, electric cables are sheathed with lead for the purpose of excluding moisture and for the protection of the insulating material against mechanical or other injuries. It is sometimes necessary to harden and strengthen the lead sheath by the addition of 1, 2 or even 3 per cent. of tin. It is a question among engineers as to whether much is gained by this alloying, since the two metals do not mix uniformly, and in consequence, when much tin is employed, hard or brittle sections may develop, due to the segregation of one of the metals.

The Labor Situation

SYNOPSIS—The miners' officials finally consented to arbitrate the eastern Ohio strike. The coal companies are not disposed to concede the straight run-of-mine scale, formerly offered, believing a slack differential desirable and wholly legal. John D. Rockefeller, Jr., meets some of the officers of the United Mine Workers of America at his office. John R. Lawson and John Mitchell testify before the Industrial Relations Commission. A strike occurs in the anthracite region.

The operators' committee and the representatives of the United Mine Workers of America held a conference in Cleveland commencing Jan. 29. The meeting was called by the federal investigators and they participated in the session. On Saturday, Jan. 30, they adjourned till Feb. 2.

The operators, at once, offered to arbitrate, believing their case so just that they could not fail to receive a favorable decision from just arbitrators. The miners at first refused to submit the matter to any such test, stating that they refused to accept less than 47c. for machine-mined run-of-mine coal. The operators have withdrawn their offer of 44.61c. for that grade of coal, preferring to pay 58c. for lump and 22c. for slack, that being the equivalent of 44.61c. for run-of-mine and putting a premium on careful mining.

All Manner of Arbitration Proposals

After the miners had refused to accept the federal investigators as the sole arbiters a plan was submitted by the operators providing for five arbitrators, the operators choosing two, the miners two, and a fifth to be chosen by the other four. Another scheme included the two federal investigators, a seventh arbitrator being selected by the other six. None of these plans were acceptable to the miners.

The tentative arrangement for arbitration roughly gives the miners three representatives and the operators, the same number. Three other arbitrators are to be appointed by Federal Judges Killits of Toledo and Clarke of Cleveland. The miners refuse to let Hywel Davies or Daniel J. Keefe be members of the board.

The international officers of the miners' organization at first took no part in the negotiations, and they appeared opposed to the principle of arbitration as desired by the operators and the federal investigators. They have placed themselves under an obligation to the other operators with whom they made an agreement under which they promised not to settle with the eastern Ohio operators for less than 47c. per ton. This promise they regard as sacred, but they also pledged themselves not to concede a lump-coal scale in the Pittsburgh district and to be content with an equivalent of last year's scale in eastern Ohio but apparently they do not regard themselves bound to submit to these latter pledges. They regard them as having an inferior order of sanctity.

The Mines Are Not Working

Few mines are being worked. The Robey-Somers Coal Co. was employing about 100 men, and the tonnage was steadily increasing but on Jan. 30, the mine was closed pending the results of the federal investigation.

The Bradley mine of the United States Coal Co. is working, for the most part making the preliminary improvements necessary to prepare the mine for more extended operation. Several mines are cleaning up so that they can operate after the federal investigation is completed or the arbitral award is made, either agreeably to the decision if one is reached or "open shop" if no result is attained.

One of the eviction notices has been decided null and void on a technicality. In another case Justice Young decided for the defendant against the Robey-Somers Coal Co. where no technical error was alleged. The company declared it will proceed to evict miners who refuse to work in its mines under "open shop" rules but probably the arbitration which is now assured will delay any such action.

About 40,000 pairs of shoes have been delivered to the miners by the Union. They were purchased from a firm in Newark, N. J. It has been discovered that they do not bear the union label, and some of the miners' families though desperately in need of shoes are considering seriously whether "scab" shoes should clothe the feet of stalwart unionist miners.

Testimony of J. D. Rockefeller, Jr.

On Jan. 29, John D. Rockefeller, Jr. concluded his three-day testimony relative to his attitude toward labor, his relations toward the Colorado Fuel & Iron Co., the Colorado situation, and the Rockefeller Commission. He made a good impression but it cannot be said he helped the case for the Colorado Fuel & Iron Co. or the Colorado operators, because while he declared for certain principles of action, he was unable to show that these were being followed by the persons in control in the field. His frank admission that he did not know was, however, quite generally accepted.

The representatives of the miners, John R. Lawson, F. J. Hayes, Edward L. Doyle and Mother Jones seemed quite hopeful that John D. Rockefeller, Jr. was preparing to write to J. F. Welborn demanding that he recognize their union and make collections for it. Mother Jones' rapturous references to John D. Rockefeller, Jr. whom she declared she had once called "a burglar," appeared in all the papers. But the next day these worthies called on Mr. Rockefeller and Mother Jones had much to say about mere "lip-service to democracy." John R. Lawson appeared before the Commission and with unquestioned eloquence condemned Mr. Rockefeller, his commission and his capital. Somehow his statement failed to convince and was not received as well as Mr. Rockefeller's testimony.

The press will henceforth be more friendly, because the reporters have been admitted to the Rockefeller sanctum. No matter what he said, they have been appeased. After all in the past, absent treatment is what has been galling them, for the reporters and editorialists are too old in the profession to believe the fairy tales so cheerfully told them by the socialist press. But no good result will come out of the "rapprochement" between the agitators and Mr. Rockefeller. He will not help them and they know it.

John Mitchell's testimony was somewhat difficult to follow. He like many other people has been dreading large corporations. He stated that they reduced wages. This has never been the experience. They have repeatedly raised prices but they invariably pay higher wages than smaller corporations in the same district and provide better working conditions. It is true they could depress wages but they do not do it and since large corporations have come into being we do not have reductions in wages every time there is a lull in business as in the past. This stability is due to the action of the larger companies. As the strike in Colorado was not really about wages, it was a folly for John Mitchell to declare that the miners thought they might as well "starve idle as starve working."

Aristocracy in Laboring Men

The Dauphin County court in Pennsylvania has decided in favor of James E. Roderick's ruling that all men are eligible as mine foremen who, having had five years' experience in the mines, prove competent on examination for the place. The attempt to restrict the position to those who have dug and shot coal at the face for five years has therefore failed completely. Judge McCarrell, of the Dauphin County court, has declined to hear the 15 exceptions made to the ruling. The rule dismissing the case has been made absolute.

The attempt to make the office a place of special privilege for those who have been miners has fortunately failed. The United Mine Workers of America which has always most commendably stood for all the workingmen around the mine did ill to act on behalf of a few instead of all its members. James Matthews, president of the Ninth district by his suit against the head of the Department of Mines of Pennsylvania endeavored to establish what was an aristocracy of mining labor.

Union Buttons in Anthracite Region

On Jan. 26, the Lehigh Valley Coal Co. is alleged to have ordered the men away from its Franklin colliery who were examining the miners to see that all wore union buttons. The men left, but 600 men and boys went on strike. On Jan. 25, the executive boards of five Pennsylvania districts of the United Workers of America assembled at Harrisburg to discuss legislation relative to workmen's compensation and child labor.

The Federal court in Arkansas has ordered Andrew S. Dowd, the receiver in succession to Franklin Bache to sell the Bache-Denman Coal Co. properties. Mr. Dowd says that a deal to sell the coal lands and mines to the United Mine Workers of America has been under way for several weeks, but has not been completed.

Central-Station Power

By Wilfred Sykes*

SYNOPSIS—Many contracts for central-station power are unfair. Such agreements to be equitable should be composed of three elements: A fixed charge depending on the peak load, a flat rate per kilowatt-hour and, if power-factor is a consideration, a limit should be fixed, a high value receiving a lesser charge per unit of power while a low value should be penalized.

It is not uncommon for an electrical engineer to be asked to recommend apparatus for a mine purchasing electric energy which will enable the power costs to be reduced in some way or other. An analysis of many such cases has shown that almost invariably the power contract is defective in some respect.

Many of the contracts in force embody clauses that require the purchaser of power to use apparatus that is neither the cheapest nor the most economical that might be used. Undoubtedly much of this trouble is due to the fact that proper attention has not been given either by the purchaser, or by the central station, to the best form of agreement.

There has been a marked improvement during the last few years in contracts made by large central stations, but in general, there remains much to be desired. The purchaser is also to blame for not giving the subject proper attention. Where a man will carefully investigate the relative merits of the different makes of apparatus involving an outlay of say $1000, a power contract involving an expenditure of $10,000 to $20,000 per year will be signed without receiving much thought. Often the purchaser feels that he is not competent to understand this contract or to pass upon it, and the verbal explanations of the power salesman are accepted. Such a proceeding often leads to misunderstandings and disappointment to the purchaser.

The basis of all contracts must be that they are mutually advantageous and, consequently, just to both parties. The central station must receive an equitable return for its operating expenses, the overhead charges of the apparatus required to furnish the power, and a fair margin of profit. No contract that penalizes the purchaser for poor operating conditions due to other customers or for bad engineering of the central station is fair, but unfortunately in some territories such contracts are in force and increase the cost of power to the purchaser without any proper return.

The general basis of power charges is usually fairly well understood by large purchasers, and most operators appreciate that their costs may be roughly divided into two groups. First, those including fixed charges such as distribution, interest, and amortization, and second, the operating charges such as fuel, stores, labor, etc. In many cases such items as line maintenance, etc., might be included in the fixed charges, as they are practically independent of the load on the equipment. That some system of charging, taking this fact into consideration, is the one that will give the lowest cost to the purchaser and will also be fair to the central station is quite clear.

It is clear also that the central station can give a lower rate as the price paid for the power varies approximately as the costs, and it is therefore possible to determine more accurately what will be received from any given business. If a flat rate is made it must be set at such a value that the average load factor of the system will be profitable. Consequently, purchasers of large amounts of power cannot be given any better rate than those requiring a small amount during only a short period.

It is immaterial whether the power is generated in a central station and distributed to a number of customers, or whether each of the customers has his own generating plant, the power cost will be made up of the same items. Little power is now sold on a flat rate as it is recognized the best prices cannot be given with a charge which does not adapt itself to varying conditions. A flat rate is usually adapted for only small customers and for lighting.

Various schemes have been gotten up to give power rates which vary approximately as does the cost of power, but it is only during the last few years that anything approaching a proper basis has been devised. This has been mainly due to the fact that there has been no apparatus available to accurately determine what the charge for power should be, although it has been recognized for a long time that a proper basis of charging is one that involves a fixed amount depending upon the demand on the central station, and a variable charge depending upon the number of kilowatt-hours consumed.

The only way in which the amount of power-station equipment that is required for each customer can be determined is by keeping some record of that customer's load conditions. There is considerable difference of opinion as to what is a fair basis for determining the amount of apparatus needed for certain customers. It is generally conceded that an integrated peak, or in other words, the average load for a certain period, say 5 minutes, is the proper basis. The period varies widely, some stations taking the average peak for one minute, others 5 minutes, 15 minutes, or 30 minutes.

Still another arrangement is to take the average of say 6 of the highest 5-minute peaks during the month. One-minute peaks are hardly fair to the purchaser as a peak of such short duration does not fix the capacity of the apparatus that must be used. If, however, the rate is such that the amount of equipment that is considered reserved for the customer is, say, two-thirds of that indicated by the peak, or some other percentage that is approximately correct and the rate is made accordingly, then there is no objection to a peak of this duration being used as a basis for charging.

If a 5-minute peak is taken, the capacity of the apparatus reserved, of course, is nearer to the value indicated during this interval. In general, however, a 5-minute or longer period works out more satisfactorily for everyone concerned than does a shorter one. Instantaneous peaks are the basis of charges in some cases, but are generally unsatisfactory due to the difficulty of measuring them,

---

*Westinghouse Electric & Manufacturing Co., East Pittsburgh, Penn.

and also of making proper allowances for abnormal peaks, for which the customer is not responsible.

It is the load that must be carried for, say, 15 minutes, or half an hour, that really determines the capacity of the generating plant, and therefore the proper basis for charging is one that takes this point into consideration. In other words, the average, or integrated, peak load for a reasonable period must be used. The period taken is, generally, 15 minutes to half an hour; the larger power stations adopting a longer period, as the variety of their load enables them to take a more liberal attitude towards the customer than is possible with a smaller plant.

To determine, to some extent, the effect of the length of the integrated peak upon the basis of charging, a number of investigations have been made, and the results of one case are shown below.

Taking the 15-min. peak as a basis, the 5-min. and 10-min. peaks are given as a percentage:

15-min. peak	100 per cent.
10-min. peak	104 per cent.
5-min. peak	106½ per cent.

It is usually not possible to arrange the fixed charge that a large customer pays so that it will cover the total fixed charges of the station that would be represented by the capacity measured on, say, a 15-min. integrated peak, as the charge would be so high that it would be difficult to secure business.

It is usually easy, however, to obtain a fixed charge that would be equal to the corresponding figure if the customer installed his own station, which he could do, generally, at a lower cost per kilowatt capacity than the central plant, as he would have considerably shorter lines, and the standard of equipment probably would not be so high.

The additional flat rate per kilowatt-hour is a much more flexible charge, and the average customer is usually prepared to stand for a flat rate that represents a fair profit, whereas the fixed charge must be reduced below what is really an equitable figure. Much of this difficulty is due to the fact that customers have, as a rule, little idea as to the proportion of fixed and variable charges in their power accounts, and therefore have not been educated to see these charges in their proper relation.

In the case of a large system, supplying power to both large and small consumers, the question naturally arises, should the large user pay the same rate as the smaller one? In general, it is reasonable for the large customer to expect a lower rate, as he looks on the matter from the standpoint of what he could do with his own generating plant, and this is a condition that must be met by the central station.

One point that is receiving more attention from central stations is the effect of power-factor on their lines and equipment. Power-factor determines the percentage of apparatus installed that can be usefully employed for delivering energy and the station has the right to expect that the customer shall maintain a reasonable operating power-factor.

Some central stations are attempting to meet this condition by regulations designed to control the type of apparatus used by the customer, but there are limits to this arrangement that reduce the value of the scheme. It is customary to require synchronous motor-generator sets to be used for direct-current work, and, as much of the power required by mines is for haulage, coal cutters, etc., fairly good results can be obtained by this simple expedient. But there are a great many cases where induction-motor load predominates, and a more definite scheme is required.

The only definite way in which this factor can be controlled is to fix a minimum power-factor below which an additional amount will be charged per kilowatt-hour. In some circumstances a bonus might be given if better power-factor is maintained. To obtain a better power-factor requires the expenditure of more energy in converting apparatus. This should be paid for by the station if it obtains any advantage therefrom. It is not fair, however, for any station to require a power purchaser to install apparatus which is more expensive in first cost, and less efficient in operation without some benefit in rate being given. A number of stations have attempted to control the apparatus installed by their customers in order to correct past errors, without giving the purchaser the benefit of a lower rate. Often such contracts appear attractive to the uninitiated.

A case recently came to the writer's attention where a central station with a long transmission line had induced one of the customers to install a synchronous motor-generator set having an extreme kv.-a. capacity in proportion to its kw. capacity, and which was to be used for correcting poor line conditions. As an inducement the power company offered to supply an attendant for the substation, and the arrangement was accepted by the customer without investigation. The net result was that the customer paid several times the amount of the attendant's wages for extra power.

In view of the above it will be seen that the following should be the basis for power contracts:

(A) A fixed charge, depending upon the integrated peak load for a reasonable period, so that it will represent, approximately, the equipment required to carry the consumer's load.

(B) In addition to the above, a flat rate per kilowatt-hour, based on operating costs, taking into consideration the amount of power used, and allowing a graduated discount so as to give large consumers a lower rate.

(C) If power-factor is a consideration, a reasonable limit should be set, lower power-factors being penalized by increasing the rate per kilowatt-hour, and a reduction in rate granted if high power-factor is obtained.

I believe that if this plan were generally followed, it would be possible to meet all the conditions arising in mining work, and to fix rates that can be given to all consumers that will represent profitable business.

In conclusion, it must be pointed out that to secure a proper load the central station should adopt a generous policy towards its customers, and when there is doubt as to the effect of operating conditions upon the station's costs, it should be prepared to accept the risk, rather than attempt to place a burden upon the consumer which may not be justified by results. The central station has the advantage of a diversity of loads, and a part of this benefit should be given to the consumer.

◆

While tape and braided rubber wire and cables are used for indoor and submarine service with entire satisfaction without lead sheathing, experience has demonstrated the advisability of inclosing the cable in a sheath wherever it is used in conduits for underground work, or where it will be exposed to acids, gases, extreme temperature changes or other destructive agencies.

The Mine Foreman

"If every mine foreman were given a Carnegie medal for every act of heroism he performed, this plan would keep a factory busy turning the medals out," said Col. R. A. Phillips, of the Delaware, Lackawanna & Western R.R. Co.

There is a group of over 2500 men in the anthracite region of Pennsylvania who always look you straight in the eye. Big, burly chaps, they are, for the most part, and they range in age from 30 years to the term of life. They are the mine foremen and assistant mine foremen, each one of whom bears the responsibility for not only many thousands of dollars' worth of property, but for hundreds of lives.

The anthracite industry has been responsible for the development of this group of splendid men, but it would be a fairer way to put it that they have been largely responsible for the development of the anthracite industry. Occasionally a man who is unfit attains the position of mine foreman, but he does not keep it long.

The mine foreman must listen to the complaints of men of many nations; he must pore over mine maps at night to see where those needed extra cars of coal are to come from; he must control his men, and keep them from going into danger, and be the first to face a peril himself. He must be a leader of men.

The mine foreman must have the confidence of his employees and the confidence of his men. He must be a diplomat, a financier, an executive, a student, a disciplinarian and a philanthropist. On him depends to a large extent the success or the failure of an operation. By the general public, he is unhonored and unsung, but he is doing his job and doing it mighty well.

⁂

Electric Shotfiring in Bituminous Mines

By M. D. Cooper*

The employment of especially qualified men to fire shots in gaseous workings is intended to reduce accidents due to carelessness or ignorance on the part of the miners. It is self-evident that a person whose sole duty it is to fire shots after examining the place and determining that all the surrounding conditions are safe is much less liable to cause an accident than one whose main duty is to load coal, and from whom, therefore, the firing of an occasional shot is of secondary importance.

The Bituminous Mine Law of Pennsylvania requires that "in such portions of a mine where explosive gas is being generated in quantities sufficient to be detected by an approved safety lamp, in which locked safety lamps are used, the mine foreman shall employ a sufficient number of competent persons who are able to speak the English language, to act as shotfirers, whose duty shall be to charge, tamp and fire all holes properly placed by the miners and to refuse to charge any holes not properly placed." The same law further provides that all such holes shall be fired by an electric apparatus, and no person other than the shotfirers shall connect up the wires or operate said apparatus.

The advantages of electric firing make for greater safety than where fuse or squibs are employed. No open light is required where electric current is used, and the danger of misfires is considerably lessened. Again, the burning through of fuse, with its consequent dangers, is avoided by the use of electric detonators. Moreover, the shotfirer may locate himself in a safe place before firing the charge.

For the purpose of firing shots electrically, a small hand generator or blasting machine may be used, or in place of this, a box containing two dry cells may be satisfactorily employed where it is necessary to fire but one shot at a time. Blasting machines of various types may be purchased from the manufacturers of explosives. On the other hand, a safe battery box may be home-made.

Details of a Simple Shotfiring Box

A convenient, cheap and easily constructed shotfiring box is shown in Fig. 1. This apparatus consists of two ordinary dry cells, a small steel spring, a contact plate, two binding posts, and a box made of ½-in. boards, to which a shoulder strap may be attached. To operate the apparatus, the battery wires are first connected to the wires of the detonator, and then to the binding posts of the battery box. After this a wooden plug, of sufficient length and of the proper diameter to make a snug fit in the hole provided for the plug in the top of the box, is pressed down to bend the spring into contact with the contact plate. In this manner the circuit is closed and the shot fired.

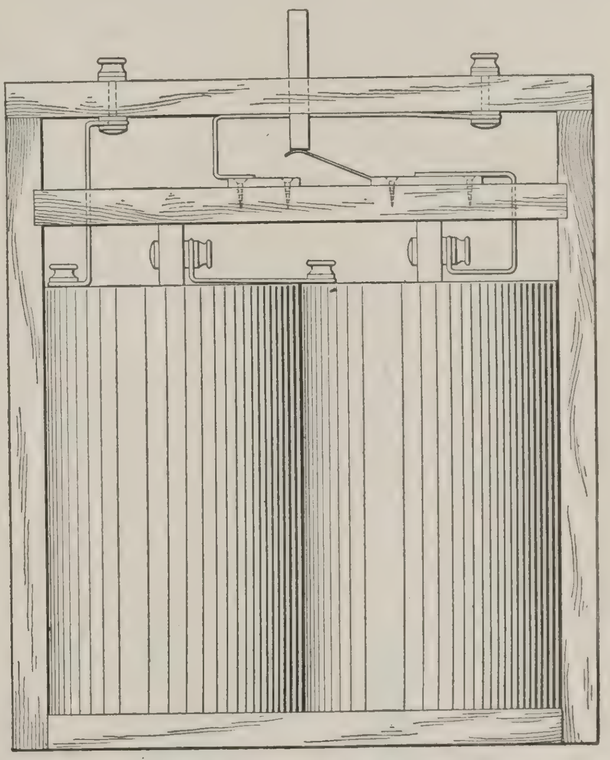

Fig. 1. Shotfirer's Battery Box with Front Cover Removed

With this apparatus, it is found that a shotfirer can set off an average of 50 shots in eight hours under normal conditions of working, where the distances between shots are not excessive. The life of the batteries varies, but in general a pair ought to last 150 days, which is equivalent to 7500 shots. The wires used to connect the battery to the detonator wires are made up of two separately insulated wires, No. 14 B. & S. gage, covered by an outer insulation binding both wires together. Its life depends entirely upon the manner in which it is used.

---

*Mining engineer, Ellsworth, Penn.

If, after firing, the shotfirer drags the wire toward him while coiling it, it may be rendered unfit for service in about two or three weeks. However, if he walks toward the place where the shot was fired while taking up the wire, thus avoiding unnecessary wear, it will be found that it will be safe for use, in some cases, for a year. After the insulation becomes worn, so that any part of the wire except at the ends is exposed, the insulation must be repaired, or the wire discarded on account of the danger of a difference of potential between the bottom and the rails on which the wire may rest.

A lighter apparatus than that described above may be made by substituting for the two standard dry cells a single battery of three units, such as that used in a small cylindrical flash lamp. This arrangement, however, is somewhat more expensive.

In order to have some definite record of the work of shotfirers, and to provide a means of increasing the efficiency of their work and equipment, each shotfirer ought to fill out and hand to the mine foreman a daily report on a blank similar to that illustrated below:

SHOTFIRER'S REPORT

................, 19...

Mine No. ......
Section No. ......
1. Before charging each shothole, did you examine the place for all dangers?..
2. Total number of shots fired ....
3. Shots I refused to fire:
Location Reason
1. ....
2. ....
4. Blownout shots:
Location Reason
1. ....
2. ....
5. Misfires:
Location Reason
1. ....
2. ....
6. After firing, did you return and examine each place where a shot was fired?....................................
7. Remarks ....

Shotfirer.

When It Pinches

Written Expressly for COAL AGE
By BERTON BRALEY

WHEN the breaker's running steady
And the trade's O. K.
We've got our grievance ready
All along the way,
We do our daily mining
With an ugly frown,
But—we sure do miss the money
When the mine
shuts
down!

IT'S not a picnic mining
'Way below the soil,
Where the sun is never shining
On your hard day's toil,
But it buys you food and clothing
And the wife's new gown,
And—you aren't so keen on loafing
When the mine
shuts
down!

THE *pitboss makes us weary and the foreman, too.*

WHEN the hoist is jerking cages
And the payroll's strong,
We blow a lot of wages
Just for wine and song,
We treat the other fellows
And we do things brown,
But—we sort of wish we hadn't
When the mine
shuts
down!

WHEN *the mine shuts down.*

OH, the pitboss makes us weary
And the foreman, too,
And we're always sort of leary
Of the things they do,
We talk about them nasty
All around the town,
But—we find we're *longing* for 'em.
When the mine
shuts
down!

THERE are grievances in season
Which are just and fair,
But we ought to keep in reason
While the job is there,
For when trouble's really busy
Why, she does things brown,
And you're pretty sure to meet her
When the mine
shuts
down!

Editorials

Not To Inform but To Confuse

The New York *World* gives the following apocryphal account of the termination of the Colorado strike:

> Nothing in all of the testimony of John D. Rockefeller, Jr., was more illuminating than his description of the manner in which the great Colorado strike came to an end.
>
> The employees were invited to elect delegates to meet the executive officers of the employing company in Denver, and did so. At this conference the spirit manifested on both sides was "most satisfactory," and it is Mr. Rockefeller's hope and belief that from this meeting will develop some permanent machinery which will insure to employees quick and easy access to the executive officers with reference to any grievances, real or assumed.
>
> If there had been such access a year or two ago, it is probable that there would have been no strike.
>
> How easily these things can be done when there is a real disposition to do them!

Our readers will recall that Mr. Rockefeller stated, as we printed last week, that the strike ended on Dec. 10, 1914, that the call for a joint conference between the employees and the company was not made till Jan. 5 of this year, and that the meeting was not held till Jan. 19. In this conference few if any of the strikers took part. Only those employed by the Colorado Fuel & Iron Co. were represented, and that corporation had reinstated but few of the striking men as their mines were already almost completely supplied.

Moreover the Colorado Fuel & Iron Co.'s men do not by any manner of means comprise all the striking miners of Colorado. The surrender of the union was not to that company alone but to several others and covered at least one important district where the "Fuel Company" does not even have a mine.

Would it be too exacting if we were to ask the editorialist of the *World* to read the columns of his own paper, and thus avoid adding to the confusion of thought already prevailing relative to the Colorado situation?

* * *

A Congressman on Feudalism

Congressman David J. Lewis recently made some interesting statements before the Federal Industrial Relations Commission. We have quoted them on another page. He showed how naturally the coal operator became landlord, merchant, doctor, and even saloon-keeper for the miners under his employ. He then said that this was unfortunate because when the employee fell out with the operator, he was at war at the same time with the man who not only paid him wages, but housed him, sold him food and clothing, provided him with medicine and even with beer. The employee by the fact that he had quarreled with one man, became an outcast without a friend.

Now Congressman Lewis' statement has only a small relation to the truth. In a big city, say Minneapolis, where the happy people are not cursed with mine operators nor injured by their feudalistic tendencies, when a man is discharged by his employer, he is evicted by his landlord, refused food and clothing by his storekeeper and he cannot get his "growler" filled by the saloon-keeper. He can, however, usually get care at the dispensary. But this is a small mercy and so the plight of the jobless is terrible. On the other hand, in the feudal mines of eastern Ohio, the men have lived in the companies' houses for ten months without paying rent, and only now, at last, are the men about to be evicted.

Public opinion is much wrought up about the proposal to dispossess these men. The feudal barons of eastern Ohio are subjected to most severe criticism for doing after a year what the average landlord would do in a month with but little criticism and almost no resistance.

We do not know just what credits the company commissaries in Ohio may have given during the strike. Perhaps they refused entirely to give any supplies to the men without immediate money payment, but we do know that in many places commissary stores have on occasions financed strikers against their companies by letting the employees of the corporation have goods on credit.

In the 1894 strike one company, after it had given all the credit which it felt justified in extending, actually let the miners take the commissary mules and wagon to make house-to-house trips for contributions. The store manager, while he could not advance any more goods, did not want to see the women and children go hungry. So he furnished the wagon. It would hardly be done today, for the farmers are no longer sympathetic, knowing that the miners who are striking make more than the farmers even when crops are good; so sending out a wagon to the neighboring farmhouses would not be of any avail.

To show that in the matter of medical attention the companies' rule is not altogether undesirable from the point of the miner, we will relate a recent incident. We strolled into a superintendent's office and noted that a little box of money was brought to him which he passed out to miners, who occasionally appeared at the window and presented slips.

On inquiry we learned that there had been a strike lasting a month; the company doctor continued his ministrations as before, and the clerk when he made up the first payroll after the strike was over, deducted from each man the pay due the doctor for his services during the strike period.

But another strike was threatened by the union if the money was not returned. The employees had been idle, and though the doctor had been working, they contended that he should be contented to lose his pay just as they had theirs and should be willing to donate his medicines into the bargain. The company had been obliged to deprive the doctor of his dues in order to pacify the union.

These evidences of the benignity of feudalism are all we will now offer. We will not say anything about the saloon. We fear to do so because we are prone to believe that if an operator were wicked enough to run a saloon he would be base enough to break his beer pump if his miners went on strike. However, we only know of two cases where saloons were run by company officials, and we know that in those instances the company was not a party to the business and had no ownership in the building.

Despite all we have said, however, in defense of the industry, we agree with Congressman Lewis that if the United States were all feudalized like some mining towns, it would be an unfortunate and an un-American situation. Justified and endurable or not, the operators should endeavor to correct that condition, for it is well that men should control their own actions and mold at pleasure their own lives.

Nevertheless his conclusions need not be taken too seriously. He is merely pointing out that a local condition if made universal would be unbearable. Some individuals own property; it would be unendurable if one man owned it all. But that is not sufficient to condemn private ownership.

But if Congressman Lewis really believes the water of feudalism may become a deluge, let us assure him that like the oceanic area its limits increase and decrease so as to make little change from year to year. It is true that recently the companies have increased feudalism in Kentucky by collecting for extra school terms, in the anthracite region by levying a contribution for the priests and in many sections by holding back pay for the hospital. It is also true that large sums of money are held back by those feudal barons and paid over to the union and in many places this is done whether the employees really desire it or not.

But against these lapses into feudalism, we may instance the increase in private home ownership from one end of the country to another, especially in the Middle West and the gradual decline of the company store. Where the latter exists, it is greatly improved and usually the best store and most reasonable the neighborhood affords.

In conclusion, let us remark that Congressman Lewis acknowledges that feudalism has an element of inevitability. Might we not also ask him to grant that in its care of the workingman it has even more the quality of benignity? In fact, its extension of late years has been perhaps wholly in that direction.

As evidence that feudalism as denounced may be benign, let us call attention to the fact that Henry Ford is declared to be feudal in his relations with the employees in his celebrated automobile factory. In fact, the feudal attitude always was truly protective and the creed of the uncompromising anti-feudalist is "the immortal rhetoric of Cain." We are harried back and forth between the contemners of the saying, "Am I my brother's keeper?" and the propagandists who demand "Who made thee a prince and a ruler over us?" Thus, the capitalist runs the gauntlet and it is a poor fool who cannot plant an effective blow on his head.

⁂

Domestic Coal Consumers Economizing

Retail yards in the factory towns all over the country complain that the domestic consumption is much less than in former years. Many householders allow their fires to go out over night and only burn coal during the day time for cooking and heating purposes. Other families have been disbanded and are living with relatives, and the net result in every case is that there is one less household consuming coal. These are some of the reasons why the retailers still have an accumulation of coal left over from shipments of last summer and fall, and explains their failure to place orders appropriate to the season.

The Dream of Conservation

This is an age of dreams and dreamers, but modern man dreams upon his feet with both eyes open. And, unlike the mental visions of the past, the thought-image of today not infrequently materializes into reality, crystallizes into wood and steel, brick and reinforced concrete, into better physical or moral conditions, into labor-saving devices or cheaper necessities; in short, into those things which in one way or another make life more worth while.

The conservation of natural resources has been a dream. Its realization has begun. True conservation is, however, composed of two elements, one of which affects production, while the other affects utilization. Wherein lies either the equity or logic of forcing a coal operator under pain of fine or other punishment to extract the last ton of coal from a given measure, allowing the consumer meanwhile to waste as much of the heat content of the fuel produced as suits his fancy?

Some of the mining methods and practices in vogue in this country have been, and are still, highly reprehensible and should by no means be condoned. The percentage of extraction attained in many mining districts may be woefully, aye criminally low, but the profligacy of even the average consumer in his utilization of the heat contained in this fuel vastly exceeds the waste of the producer.

Nor are the means entirely lacking whereby to secure a greater return in heat absorbed for the fuel-capital invested, as is shown by Mr. Van Brunt, of the Combustion Engineering Co. of New York, in our current foreword. He points out that the proper equipment installed under mine boilers allows the utilization of fuel, which but a short time ago was considered purely and solely as an unavoidable waste.

And if equipment, scientifically designed and constructed, will turn a loss into a gain, if it will enable the consumption and utilization as power of a waste product, which otherwise must needs be disposed of at an expense, a long step has been taken toward true conservation.

The conservation of our vast natural stores of fuel has for some time been a favorite theme among dreamers with political proclivities. These have secured, or procured, legislative and congressional enactments concerning coal lands in the public domain, which have masked as beneficent, but which have nevertheless failed utterly to either materially enrich the public coffer or reduce the price of fuel.

It has remained for the practical dreamer—the one who puts his vision into wood, steel, copper, brick, or concrete—to develop just such devices as that mentioned in our foreword, and to conserve, not the coal in the ground, but to render available a higher percentage of the heat which it contains.

The progress of the world demands the efforts of both kinds of dreamers. True conservation—which is only another word for thoroughness—will be attained so far as the fuel industry is concerned when the percentage of extraction from the earth and the heat absorption from the coal are each a maximum. The dream of the conservationist may eventually be realized—we are on the right road. But when it finally meets fulfillment, it will be found to be composed of two parts equally important—conservation in production, and conservation in utilization.

Success

In our Jan. 2 issue we announced a special "Success" number of Coal Age as a coming feature that would doubtless be of unusual interest. Since publishing this preliminary notice, a number of excellent articles, well adapted for such an issue, have been received, and as a consequence we are more than ever certain that our readers will all help to make this particular number of Coal Age the biggest and best issue so far published.

Arrangements have been made, therefore, to print the special "Success" number of Coal Age on Apr. 3, and we invite the active participation of all our readers. Every article prepared for this particular issue must bear closely on the subject success, although it may deal with a man, a machine or a method.

One article already received tells of a man who came to this country a poor emigrant boy, and the writer of the article (an acquaintance of the fellow) recites the story of this man's struggles to climb to his present position as mine superintendent. Perhaps you know a similar case; if so, write it up and send it to us.

At the mine where your interests lie perhaps there is a fireboss, or foreman, or other official, who, in proportion to his opportunities, has made a greater success than the president of the company that employs him. Maybe the man you have in mind has had no chance to secure a schooling, and, notwithstanding this severe handicap, perhaps he has afforded his children an education, and in addition has paid for the home he lives in. That's a story worth printing.

Then there's the case of a mine where failure has been turned to success by the adoption or application of a new method of working, or by the installation of certain types of new machinery, or maybe some new efficiency plan has saved the day. Nothing could be more interesting.

In order that all who desire to do so may prepare something for this special number, we have decided to limit each contributor to one article. If you don't want to send us something yourself, tell us what you would like to see written up in this special issue, and we will try to follow out your suggestion. Remember that your name doesn't have to appear with the article you write.

Just think! is there anything so close to our hearts as that magic word "success"? Is there anything easier to talk about? Is there anything more interesting to read about?

Pick your subject and start your article today. Get it in our hands as soon as possible, so we can set it up in type and return it to you for correction and revision.

⁂

Letter No. 1 Wins in the Contest--Who Gets the Promotion?

After a competition that was interesting in the extreme, the readers of Coal Age by a large popular vote selected Letter No. 1 written by J. E. Butler, general manager of The Stearns Coal Co., Stearns, Ky., as the winning answer to the cartoon—Who Gets the Promotion?

There was an enthusiastic response to our invitation for a popular vote, readers in all coal states sending in their choice by letters and postals. In one instance, a single large company operating a number of mines submitted 18 votes. There is every evidence that the question was discussed in detail in all fields. Quite a few people stated their choice of the three men up for promotion, but did not select one of the nine letters; these answers, of course, could not be counted.

The second most popular letter was No. 9, written by M. D. Cooper, a mining engineer of Ellsworth, Penn. Mr. Cooper ran Mr. Butler a close race, and early in the voting was slightly in the lead.

Letter No. 3 by Leo Mayer and Letter No. 6 by A. W. Calloway were always in the running, and each polled a large final vote. In fact, each one of the nine letters published had its friends and received many votes, showing how difficult it would have been for a few judges to reach a popular decision in the matter. It also occurred that a number of readers stated as their opinion that certain letters not printed among the nine were more meritorious than any of those up for vote. These same readers, however, in their actual voting confined themselves to one of the nine letters.

A careful analysis of the votes received indicates clearly that prejudice, or rather personal opinion as to which man should be promoted, played an important part in influencing each man's choice. If a reader believed that the older man of long service should be promoted, he voted for one of the letters advancing the same view. If he was in favor of promoting the "popular" man, he generally chose for the winning letter one holding views similar to his own. For this reason the final result means a little more than that Mr. Butler wrote the most convincing letter. It means also that Mr. Butler was running on the popular ticket, for there is no doubt that the young "popular" man was the choice of the majority.

A great many letters have been received from Coal Age readers, complimenting the paper on having advanced such an important, and at the same time, such a happy question for general discussion. An official of one of the largest Southern coal consolidations says that the effect of this cartoon discussion will be felt for a long time in many camps. Men who have been honest and industrious have been brought to realize that there are some traits of character worth cultivating besides industry, loyalty and persistence. They know now that a great many people figure a pleasant countenance and a sociable manner as assets of great importance in a business sense. Therefore, if the discussion has brought more smiles to the faces of many ambitious mining men, the work has been worth while.

It should not be difficult now for those who are seeking promotion to set before themselves an ideal and endeavor to pattern their lives therefrom. Ever so many letters have suggested that from this discussion we evolve an imaginary being who would fill the bill in every particular. One of our readers in a lighter vein says: "The cartoon problem would have been much simplified by the addition of a fourth applicant, who was 'some kin by marriage to the boss' wife.' Then specify in addition that the kin, the wife and the boss are all Irish, and the job is a cinch for the relation."

Discussion By Readers

Mining Laws, Legislation and Mine Regulations

Letter No. 26—It is indeed gratifying to see the great interest that has been manifested in this discussion. If you will allow me the space, I want to emphasize a few of the points already submitted. One of these is in respect to systematic timbering in mining.

It will be remembered that, about two years ago, the qusetion of systematic timbering at the working face was thoroughly discussed in Coal Age (Vol. 3, p. 286, *et seq.*). If I remember rightly, it was generally agreed in that discussion that a maximum distance between posts set at the working face should be maintained, generally. At that time, it was urged by Mine Foreman William Crooks that legislation was greatly needed to regulate the question of timbering in coal mines (Vol. 3, p. 698). I gladly indorse that suggestion and maintain that a large number of mine accidents occur from falls of roof at the working face, which would be prevented if state mining laws required the adoption of some regular system of timbering the coal face in every mine. I believe such a law would be of great assistance to all mine managers, foremen and their assistants.

I desire, also, to indorse Mr. Crook's remarks, Coal Age, Nov. 21, p. 839, in respect to the time that should elapse between the inspection of working places by the fireboss and the miners starting work for the next shift. I agree with Mr. Crooks that no more than *two hours* should elapse between the time of making such inspection and the time when men are permitted to go into the mine. This is an important matter that should be plainly treated in all mining laws.

Considering the constant recurrence of mine disasters and the number of mines that have been visited by two or more explosions, the suggestion is worthy of the most careful consideration that state mining laws should compel the introduction of safety lamps in every mine where it is known that quantities of firedamp are generated. By this I mean the exclusive use of safety lamps should be made compulsory, by law, in all mines in which gas is generated in such quantities as to necessitate the frequent marking out of certain places because of the presence of sufficient gas to make the place unsafe for work.

The mining law should further require that every person employed underground, in such mines, should be taught the use and care of safety lamps. The same requirements should be made of shotfirers who are frequently compelled to carry safety lamps in the performance of their duties. I have known instances where men employed as shotfirers and obliged to carry safety lamps knew little more about the use of the lamp than how to light the same. Under such conditions, it is no wonder that mine explosions occur.

Before closing, I want to refer briefly to the question of the *selection of mine inspectors*. It seems to me that a better method of choosing men for this office should be generally adopted. I would ask, What is the use of men fitting themselves by careful study and hard work to fill such positions when appointments to this office are given out merely for political reasons and in return for the political services of men who are ill-prepared for the work of inspecting mines? There can be no question but that every effort should be made, and *must* be made, to secure the men best fitted by knowledge and experience for this responsible position. The question has well been asked, "Does the present method of selecting men for this office accomplish this end?"

There are many points, besides, that could well be discussed, in the consideration of our mining laws and needed legislation, and I hope these points will be brought out by others who will enter this discussion.

A. Coats,
Mine Foreman.

Kimberly, Ala.

Letter No. 27—I am pleased to see the great interest that is being manifested in this discussion. I read with some surprise the criticism of my last letter, by Mine Inspector Rose, of Tennessee (Coal Age, Jan. 2, p. 25), who seems to refute the idea I expressed that the present method of appointing mine inspectors, in some states, is unsatisfactory. Mr. Rose's letter contains two points that I will answer.

1. He asks, "Is it not true that most men holding positions of trust and honor have secured those positions through influence?" Mr. Rose charges that I "do not suggest a better method for the selection of mine inspectors," in answer to which I will narrate, briefly, a few observations I have made, during the past few years, when my spare time has been taken up in teaching the principles of mining and preparing men for state mining examinations. I will say that many of these men have been successful in passing the examination, and are now holding positions of trust and honor. I might add that they did not "secure these positions through influence"; but obtained them by reason of their practical and technical training.

Permit me to ask, What kind of men are selected generally by large coal corporations, for positions on their official staff? Are men selected for these positions because of any "influence" brought to bear; or because of the ability of the candidates to deliver the goods? I venture the assertion that any shrewd mine manager will desire to know something of the candidate's capability before making him mine superintendent or foreman of his mines. It is *ability* and not *influence* that counts as a commercial asset. As an instance supporting this assertion, I recall a man who, nine years ago, was one of the rank and file in Alabama. Today, he is general superintendent of a large coal company. His rise was phenomenal; but it came as the result of his *ability to get results.*

Permit me to ask Mr. Ross, Why does the U. S. government hold civil-service examinations? Is it not to test the knowledge of applicants for the positions to be filled? Such an examination is necessary to produce qualified men. It is stated in Bulletin No. 1 of the University of Illinois that "One of the most important and prominent topics under consideration by the industrial and educational world, at the present time, is what is known as Industrial Education; that is, such education and training as will produce more skilled workmen and better foremen and bosses." I fully indorse this statement.

In reference to the appointment of state mine inspectors, Mr. Rose says:

> I fully believe that the appointment of mine inspectors by the governor is the best method that can be adopted in the interest of safety for the miner.

I trust Mr. Rose will bear with me for my failure to see any logic in a statement of this kind. Suppose, for a moment, the governor of a coal-producing state is, we will say a cotton manufacturer and knows little or nothing of the coal-mining industry. In this event, he must rely, naturally, on the advice of friends and is easily susceptible to the political influence of those who have supported his campaign for office.

In response to Mr. Rose's charge that I did not suggest a better method of selection, I would say, Make the appointment of state mine inspectors, by law, dependent upon and determined by a competitive examination. The candidate whose technical examination shows the *highest percentage* and who has had the necessary *practical experience* in the mining of coal should be recommended for appointment by the examining board, the members of which should all be mining men of experience and have sufficient technical knowledge to enable them to pass intelligently on the questions required to be answered by candidates. To my mind, this is a practical suggestion, and points out, I believe, the only sane way to safeguard mine employees. In forming my conclusions, I have tried to cultivate an unbiased opinion in respect to what I believe would go a long way toward placing the mining industry in a less dangerous class of occupation. I do not wish to appear as the man, who, looking through a dark glass, saw everything dark. I want to view things in a practical and helpful light.

WM. CROOKS.

Ensley, Ala.

Letter No. 28—One of the most important considerations, in the discussion of mining laws and needed mining legislation, is the question of the selection of state mine inspectors. I believe that it is quite generally agreed that the mine-inspection department, of all others, should be under civil-service control. This plan seems to have been followed in most coal-producing states. Viewed from the standpoint of the mine workers' organization, however, the system has the disadvantage that it places the mine-inspection service almost beyond the control of any outside influence, either political or otherwise.

The mine-inspection service in Illinois had been, for many years, practically free from the untoward influence of politics; and, as a result, the work had been brought to a high degree of efficiency. Inspection, under civil service, in this state, meant just exactly what it said. The mine inspectors were obliged to report to the Civil-Service Commission, for each month, before the seventh day of the following month. Under the rules adopted by the commission, "A false statement in an efficiency report was sufficient ground for discharge from the service." This note was printed at the bottom of each inspection-report blank, and every mine inspector understood its significance.

When the Democrats came into power, in the change of administration in the state, they naturally wanted all the offices they could control. To assist them in their efforts to secure these, they had the advantage of an obliging attorney-general. It transpired that, under the Republican administration, the civil-service law was signed after the mining law; and the attorney-general had ruled that this fact would place the mine inspectors under the civil service. But, to offset this, a further ruling was made to the effect that "All persons who are appointed by the governor and are under bonds are not under civil-service control."

It is needless to comment on the fact that, as a result of the first examination held by the new board of examiners, 19 out of 34 candidates who took the examination passed successfully. This result was in marked contrast with a previous examination held under civil service, where only 6 out of 29 candidates passed the examination. The standard of excellence of the new board is suggested by the claim, made by a prominent member of the board in discussing one of the questions given in the examination, that "The size of a hoisting engine depends on the drum."

I do not make this statement in the spirit of retaliation, but to show that, in politics, it is difficult to secure the appointment of capable men, either to serve on the examining board or in the inspection of mines. On the other hand, many office seekers and wire-pullers obtain the appointment to these important and responsible positions, as a reward for their political activities.

At the present time, a strong effort is being made in Illinois to make the office of state mine inspector an *elective* instead of an *appointive* office. This effort emanates from the state mine workers' organization. At its convention, held in Peoria, last March, a resolution was passed recommending that all state mine inspectors should be elected by popular vote. It is understood that a bill will be introduced into the state legislature now in session, providing for such an enactment. There is, however, no doubt but that a strong fight will be required to pass such a law, as the attempt will meet with determined opposition.

Of the two evils, I would much prefer to see the mine-inspection department under the baneful influence of politics, than to see that office made elective. Under politics, a mine inspector may be an honest man; but, under the elective system, honest mine inspection is practically out of the question. In order to hold his office, the inspector must overlook many flagrant violations of the mining law, on the part of the miners, and condone many shortcomings of the operators. It needs no argument to convince one that inspection, under such conditions, would be a farce, jeopardizing both the safety of human life and the security of property.

A FORMER MINE INSPECTOR.

——————, Ill.

Letter No. 29—The manner of selection of state mine inspectors appears to me to be one of the most important questions affecting the coal-mining industry, at the present time. This is eminently the case, in Illinois, where an attempt is about to be made to force a bill through the present legislature, providing that mine inspectors shall be elected at the regular state elections instead of being appointed by the governor, as formerly, or by the Civil Service Commission.

There is, perhaps, no question demanding greater attention, in respect to needed legislation than the question of efficient mine inspection. It is unnecessary to remark that mine inspectors should be in possession of the foremost mining knowledge, both practical and theoretical. A mine inspector should be a broad-minded man, capable of handling any problem that may be presented, with a clear head and without prejudice. He must be a man of courage and fearless in the discharge of the duties pertaining to his office. His character should be beyond reproach.

In order to secure men of this type and standing, I am convinced that the first requirement is an *examination,* both practical and theoretical, to ascertain the capabilities of the candidate. It is of the utmost importance that the examining board should be composed of thoroughly capable and representative men. The board should comprise, naturally, two operators, two miners and a mining engineer who is a graduate of a college and understands fully the theory, principles and practice of coal mining. The operators on the board should each be a superintendent or manager of some coal company engaged in the mining of coal. They should each possess a theoretical and practical knowledge of the principles of coal mining. The miners on the board should be men of practical experience in the mining of coal, and should possess certificates of competency obtained by them in a previous examination. A board so constituted is capable of giving a fair and thorough examination and determining with equal justice the capabilities of candidates who present themselves for examination.

When we consider that the mine inspector must meet continually with men who are the most capable representatives of both the operators and the miners, it is easy to see that an inspector must be, himself, a capable official in order to handle the various questions that arise, logically and with sound reason and common sense. There is no question but that coal mining, in this and other states, is growing in importance every day. The coal industry is advancing by strides. More capital is being expended, larger plants are being erected and extensive mines developed. The output expected from these mines far exceeds what would have been thought of a few years ago.

In the face of these conditions, it is absurdly ridiculous to consider any proposition that bids fair to lower the efficiency of the mine-inspection service. No argument is required to convince a reasonable, unprejudiced mind that such inspection service should be completely divorced from politics. The proposition to make the office elective has nothing to recommend its adoption to one who is at all familiar with the responsibilities of the position and its requirements.

Let one consider, for a moment, and ask himself the question, How can an inspector discharge the arduous duties of his office when, by so doing, would mean to forfeit his reëlection to the office? Is it not more than can be expected of human nature, for one to take an independent stand in opposition to the forces and elements to which he must look for support in future elections? As a consequence of this condition, would not the mine inspector become simply an office seeker—a good fellow with the operators and a diplomatist with mine workers, having always uppermost in his mind the chances of his reëlection to office? Can anyone say but that this would be the natural result and outcome of making the office of mine inspector an elective office?

The man must be blind indeed who cannot see that the adoption of the elective system, in the selection of men to serve as mine inspectors, would practically eliminate the question of *fitness* or *capability.* The success of the candidate for office would depend, first, on the number of votes he could command, in respect to his nomination; and, second, on the success of his party at the polls. The question may well be asked, *Why should the lives of men working in the mines and the security of valuable property be made to depend on such uncertain and changing conditions as are assured in politics?* A careful study and familiarity with the situation make the conclusion almost inevitable that neither the *miners* nor the *operators,* as a class, should be permitted to influence or in any way control the selection of a state mine inspector; because the interests of both of the parties named will be and are seriously affected by the conscientious discharge of the duties that devolve upon the inspector.

At the annual meeting of the Mine Inspectors' Institute, U. S. A., held at Birmingham, Ala., June, 1913, the inspectors present engaged in a very interesting discussion of this subject. It was generally shown by the experiences given that the elective system, in respect to mine-inspection service, seriously impaired the efficiency of the work. It was shown that not only was much time lost through the necessity of electioneering on the part of the inspector, but that he was seriously handicapped in the matter of enforcing the mining law. It was stated that the influence of the United Mine Workers' Organization was particularly harmful, under the elective system, since any failure of the mine inspector to comply with a request coming from an official of that organization was at once heralded throughout his district and the matter taken up by the several locals in a way that promised that the said inspector would fail of reëlection, a succeeding term. It was further shown that, under such a system, the inspector is constantly used as a tool to adjust matters that are wholly outside of his province. Reference was made to the work that Coal Age had already done to combat this law, and the hope was expressed that this work would be continued.

In closing, I want to indorse what has already been said in reference to the length of tenure of office, in the case of state mine inspectors. I want to say that the longer the inspector is in office, the more capable, efficient and valuable he becomes as a state official. Any change in the inspector means a handicap to the service in that district, as it requires time for a new inspector, no matter how capable he may be, to understand and become familiar with the working conditions of the mines in his charge. He must learn anew the attitude of the operators and miners in that district.

Again, it is plainly evident that, having acquired this knowledge of affairs and conditions, the method of treatment by a new inspector will differ materially from that of his predecessor in office; and this fact threatens an increased expense and annoyance to the operator and jeopardizes the harmonious relations existing between employer and employed, which the old inspector has been able, by his long and intimate relation, to establish. For these and other reasons, I believe that an inspector should be appointed for good behavior and removable only for cause, to be established through regular judicial action before a proper tribunal.

MINE INSPECTOR.

Drying Washed Coal

Letter No. 3—Referring to the question of John Hammond in regard to the drying of washed coal, I would suggest, as the best means available for his purpose, at the present time, the use of centrifugal coal driers, which are something new on the market and for which I have heard of claims being made that the moisture in coal can be reduced to, approximately, 3 per cent. I believe, however, that such statements have been frequently misunderstood, as I think it is more generally admitted that the best that can be expected of these machines is a reduction of the moisture to about 3 per cent. *above the ordinary moisture content of the raw coal before washing.*

I have been doing considerable experimenting with one of these machines and, under certain conditions, have succeeded in reducing the moisture to about 4.5 per cent., which is the lowest obtained to date. I believe, however, that it is too early to predict the possibilities of these machines of the various makes; and I do not believe that definite information can be given, until they have been tested under commercially operating conditions, for several months. I believe, however, that there are good possibilities in them.

In regard to the probable increased cost of drying the coal by these machines: I think it is, also, too early to predict just what the final cost will be; and would not care to be quoted in that regard at this time.

Outside of centrifugal driers, the only other methods of drying the washed coal are through the storage of the coal in suitable bins. The extent, however, to which the moisture can be reduced depends largely on the size of the bins, as compared with the plant capacity; or, in other words, the length of time the coal can be permitted to drain before being drawn from the bin. Such systems are quite common and the results of their use are undoubtedly known to this correspondent, and I assume no further discussion of that point is required.

I shall be glad to give additional information in regard to centrifugal driers at such time as the work has been carried to a point where such data will be of definite value.

G. R. DELAMATER,
Consulting Engineer.

Harrisburg, Penn.

Study Course in Coal Mining

BY J. T. BEARD

The Coal Age Pocket Book

Size of Discharge Portal—The required diameter (d) of the discharge portal of a centrifugal pump, as stated previously, depends on both the gallons (G) of water pumped and the head (h) against which the pump discharges. This is calculated by the formula

$$d = 0.56\sqrt{\frac{G}{\sqrt{h}}};\ \text{or}\ \sqrt{\frac{G}{\sqrt{10\,h}}}$$

It is evident, therefore, that the area of the discharge portal of the pump is always less than that of the column pipe, the diameter of which is calculated for the given discharge (G) and a velocity of 400 ft. per min., as in other types of pumps, according to the formula previously given,

$$d_c = 0.25\sqrt{G}$$

Diameter Ratio for Different Heads—Comparing the two formulas last given, it is clear that the ratio of the diameter of the column pipe to the diameter of the discharge portal of a centrifugal pump is independent of the quantity of water pumped, and varies as the fourth root of the discharge head. This diameter ratio is given by the formula

$$\frac{d_c}{d} = \frac{0.25}{0.56}\sqrt[4]{h} = \text{say}\ \frac{4}{9}\sqrt[4]{h}$$

In other words, the suitable diameter of column pipe for a double-suction, volute pump is found by multiplying the diameter of discharge in inches (number of pump), by four-ninths of the fourth root of the head in feet. For example, a No. 10 pump of this type, discharging under a head of 150 ft. will require a 16-in. column pipe to reduce the velocity of the flow to, approximately, 400 ft. per min., in the pipe.

Capacity of Double-Suction, Volute Pumps—Calling the number of this type of pump N, the rated capacity of the pump, for a maximum efficiency and a given head (h) in feet, is given approximately by the formula

$$G = N^2\sqrt{10\,h}$$

Limitations in Practice—Naturally, the adaptation of centrifugal pumps, like centrifugal fans, is limited to certain conditions, in respect to the quantity of water to be handled and the head. For the same pump, within certain limits determined by a falling off in efficiency, the discharge varies as the square root of the head.

For example, a small No. 2, double-suction, volute pump capable of throwing, under a 50-ft. head,

$$G = N^2\sqrt{10\,h} = 2^2\sqrt{10 \times 50} = \text{say 90 gal. per min.}$$

is not an efficient pump to use under a head of 100 ft. or more. In other words, pumps of this class have their limits of capacity, owing to the rapid decrease of efficiency as the head is increased. The formulas given for estimating the size and capacity of these pumps relate to the maximum efficiency of the pump.

The Coal Age Pocket Book

Table Adapted to Pumping In Mines—The following table has been specially prepared to meet the conditions common to coal mining. Owing to the rapid corrosion of the pipes by the acid mine water, the usual tables giving the loss of head due to friction for the flow of water in pipes do not apply, except when the pipes are new. When using such tables it is safe to add from 20 to 25 per cent. to the values given.

The table given below is estimated for a coefficient of friction f = 0.01, instead of 0.0075 or 0.008, as is often done. The heads due to friction in the suction and column pipes are based on velocities of 200 ft. and 400 ft., respectively, and estimated for a 10-ft. suction and a 100-ft. column pipe or discharge head. This makes the total static head or lift 110 ft.

TABLE SHOWING SIZES OF SUCTION AND COLUMN PIPES, FRICTION VELOCITY AND TOTAL HEADS AND TOTAL PRESSURES, FOR DIFFERENT CAPACITIES

Water Pumped or Capacity (G.p.M.)	Friction Head, 10-Ft. Suction ($f = 0.01$) (Ft.)	Friction Head, 100-Ft. Dischg. ($f = 0.01$) (Ft.)	Diameter of Suction Pipe v_s = 200 F.p.M. (In.)	Diameter of Column Pipe v_c = 400 F.p.M (In.)	Velocity Head in Suction Pipe (200 F.p.M.) (Ft.)	Velocity Head in Column Pipe (400 F.p.M.) (Ft.)	Static Head or Total Lift (Ft.)	Total Effective Head (Ft.)	Pressure Against Which Pump Operates L.p.s.i.
50	0.336	18.85	2.47	1.75	0.17	0.69	110.0	130.0	56.4
100	0.238	13.33	3.50	2.50	....	....	.....	124.4	54.0
200	0.168	9.43	4.95	3.54	....	....	.....	120.5	52.3
300	0.137	7.70	6.06	4.33	....	....	.....	118.7	51.5

500	0.106	5.96	7.83	5.59	....	....	.....	116.9	50.7
600	0.097	5.44	8.57	6.12	....	....	.....	116.4	50.5
700	0.090	5.04	9.26	6.61	....	....	.....	116.0	50.3
800	0.084	4.71	9.90	7.07	....	....	.....	115.7	50.2
900	0.079	4.44	10.50	7.50	....	....	.....	115.4	50.1
1000	0.075	4.22	11.07	7.90	....	....	.....	115.1	50.0
1200	0.069	3.85	12.12	8.66	....	....	.....	114.8	49.9
1400	0.063	3.56	13.10	9.35	....	....	.....	114.5	49.8
1600	0.059	3.33	14.00	10.00	....	....	.....	114.3	49.7
1800	0.056	3.14	14.85	10.61	....	....	.....	114.1	49.6
2000	0.053	2.98	15.65	11.18	....	....	.....	113.9	49.5
2500	0.048	2.67	17.50	12.50	....	....	.....	113.6	49.3
3000	0.043	2.43	19.17	13.69	....	....	.....	113.3	49.2
4000	0.038	2.11	22.14	15.81	....	....	.....	113.0	49.1
5000	0.034	1.89	24.75	17.68	....	....	.....	112.8	49.0

The table gives the diameters of the suction and column pipes for the velocities named above and for different quantities discharged varying from 50 to 5000 gal. per min.

The friction head for other lengths of vertical suction and column pipes are easily found from the values given in the table. The length of inclined pipes must be found by dividing the vertical head by the sine of the angle of the slope or inclination. The table gives the exact diameter of pipe required instead of the nominal size.

Inquiries of General Interest

Pump Troubles

I want to ask, What would cause a duplex pump to overreach; or, in other words, what is the possible cause of this pump making a stroke of 15 in. on one side and 21 in. on the other side, when each side of the pump should have a stroke of 18 in.? The pump is of the Worthington type and, I may say, the water-end is in perfect condition. Our machinist in charge says that the steam valves are right. Except for the unequal stroke of the pistons, the pump is doing excellent work.

I also want to ask how much pressure the springs controlling the water valves of the pump should have. The pump is discharging against a pressure of 90 lb. per sq.in., through an 8-in. column pipe. The dimensions of the steam- and water-ends are as follows: Steam-end—high-pressure cylinder, 14 in. diameter; low-pressure cylinder, 20 in. diameter. Water-end—plunger, 11½ in. diameter. The length of stroke is 18 in. There are four suction valves and four discharge valves. What size of spring-brass wire should be used on these valves, assuming the diameter of the springs is 5 in.?

I would also like to know what danger there is, if any, in operating a pump in the condition I have stated.

MINE FOREMAN.

Coral, Penn.

There is nothing unusual or peculiar in the action of a duplex pump, as described by correspondent. It is well known that there is nothing to determine the exact length of the stroke of a pump, which may be a little longer or shorter than the specified normal stroke. The stroke is brought to rest by the admission of live steam in that end of the steam cylinder when the valve closes the exhaust port and opens the steam port. The movement of the two pistons of a duplex pump is not correspondingly uniform; and the length of the stroke of each piston is, therefore, independent. The relative distance through which each piston moves, in a single stroke, will depend not only on the movement of its valve, which is actuated by the opposite piston; but, likewise, on the stiffness of the moving parts and resistance of the valves on the respective sides of the pump.

We are advised, further, that it is possible that the cross-exhaust valve, in this particular pump, is not free to open between the cylinders, this being a compound, duplex pump. We would suggest that the machinist look carefully to the valves, again, on each side of the pump and reëxamine their setting, as this is most frequently the chief cause of such a difficulty.

The inquiry does not state anything in regard to the conditions of suction, in this case. It frequently happens that, on a very long or a very high suction, the springs controlling the suction valves must be extra light, in order to allow for the increased suction head.

The information desired in regard to the proper tension of the springs and size of brass wire required can be best obtained by corresponding directly with the manufacturers of this pump, who will be pleased to give such information and further advice as is necessary. In writing for such information, it is always required to give the number of the pump. While the observed irregularity in the action of this pump may be due to other causes, which can be detected only by a close and careful inspection, such as faulty pipe connections or bad packing, it is more than probable the trouble is in the valves.

⁂

Available Oxygen

Will you kindly explain how it is that when we are taught that oxygen is the mainstay of combustion, and anything burnt in pure oxygen is consumed with extreme rapidity, the effect of carbon dioxide, which contains more oxygen than carbon monoxide, is to *extinguish* flame while carbon monoxide *assists* the combustion.

We are taught that carbon dioxide contains two atoms of oxygen and one of carbon, while carbon monoxide contains only one atom of oxygen and one of carbon. It would seem that the gas containing the greater percentage of oxygen would naturally be the better supporter of combustion; but, on the contrary, in this case, the gas containing the less oxygen assists combustion, while that containing more oxygen has an opposite effect.

STUDENT.

Dubois, Penn.

In order for oxygen to support the combustion of matter, it must be available or free. The oxygen contained in both of these gases mentioned by correspondent is combined with carbon and is not available or free to support combustion.

The fact that carbon monoxide acts to assist combustion, while carbon dioxide has the opposite effect and reduces the combustion of matter, is due to the respective properties of these gases. Neither of the gases is a supporter of combustion of carbon or carbonaceous material. Carbon monoxide, however, is a *combustible* gas, while carbon dioxide is an *incombustible* gas. The former will therefore burn in an atmosphere of oxygen and produce, as a result, carbon dioxide. It is the heat of this combustion of the gas that assists the combustion of carbonaceous matter when this gas is present.

On the other hand, as stated, carbon dioxide being *incombustible* will not burn even in the presence of free oxygen. Therefore, when carbon dioxide is present in the atmosphere, it serves to dilute the oxygen present, making the percentage of available oxygen in the atmosphere less and thereby reducing the activity of the combustion. Not only this, but the incombustible gas when present absorbs the heat of the combustion taking place, which again reduces the rapidity of the combustion. It must be remembered that the activity and rapidity of combustion depend on the relative affinity of the elements of the combustibles for those of the supporter of combustion and the percentage of available oxygen present in the atmosphere.

Examination Questions

Alberta, Canada, Examination for First-Class Certificates, Held June 23-25, 1914

VENTILATION—(*Selected Questions*)

Ques.—What is meant by the term "occluded gases"? Name the occluded gases found in coal mines. What other gases are met with in coal mines and how do they originate? State briefly the characteristics of each gas.

Ans.—The occluded gases of coal mines are those naturally contained (occluded) in the pores of the coal or other strata. In many cases, these gases have escaped from the pores of the coal and rock and are held confined in pockets or other void spaces in the strata. The occluded gases of coal mines are: Methane or marsh gas (CH_4), olefiant gas or ethene (C_2H_4), carbon dioxide (CO_2), nitrogen (N), oxygen (O) and, in a few instances, ethane (C_2H_6). The other gases found in coal mines are: Carbon monoxide (CO) and hydrogen sulphide (H_2S). Neither of these two gases is found occluded in coal formations. Carbon monoxide is a product of the explosion of gunpowder and some nitroglycerin compounds, or of the slow combustion of carbon in a limited supply of air. Hydrogen sulphide is a product of the decomposition of pyrites, in the presence of moisture, the pyrites being frequently associated with coal formations.

The principal characteristics of the gases mentioned are briefly as follows: All the gases are colorless and without odor, except hydrogen sulphide, which has a strong, pungent odor resembling that of rotten eggs. Methane, carbon monoxide and hydrogen sulphide form explosive mixtures with air. Although carbon monoxide and hydrogen sulphide are generally considered the only poisonous gases, both being deadly in their effect on the human system, carbon dioxide has a distinctly toxic effect, producing headache, nausea, pains in the back and limbs and death by suffocation. Nitrogen is an inert gas, serving to dilute the oxygen of the air and other gases, but playing no other part in general chemical reactions. Oxygen is the great supporter of life and combustion. Olefiant gas, when present in firedamp mixtures, lowers the point of ignition and increases the explosive condition.

Ques.—If the total quantity of air circulating in a mine is 120,000 cu.ft. per min., with a water gage of 3.5 in., find the indicated horsepower of the fan engine, taking the combined efficiency of fan and engine as 70 per cent.

Ans.—The pressure corresponding to a water gage of 3.5 in. is $3.5 \times 5.2 = 18.2$ lb. per sq.ft. Then taking the combined efficiency of fan and engine as 70 per cent., the indicated horsepower of the fan engine is

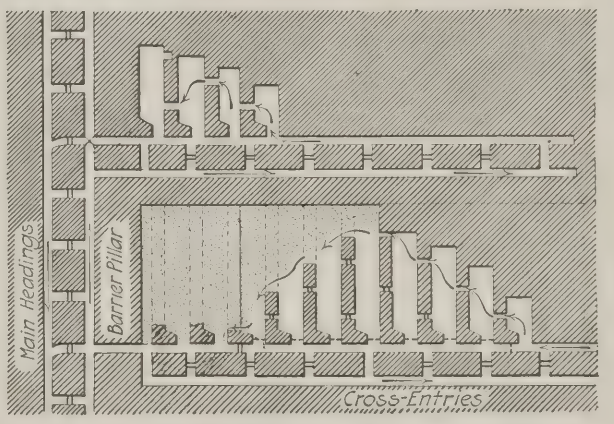
$$H = \frac{120,000 \times 18.2}{0.70 \times 33,000} = 94.5\ hp.$$

Ques.—A seam of coal lying at an inclination of 35 degrees is worked on the room-and-pillar system, the rooms being driven up the pitch. The distance between each set of levels is 400 ft. Several pillars in the lower panel have been extracted and the strata overlying the coal seam give off CH_4 freely. Rooms are still being driven to the rise of this gob and also on the inby side of it. Show by means of a sketch how you would ventilate this part of the mine.

Ans.—The question states that rooms are still being driven "on the inby side" of the section in which the pillars have been drawn. The plan is therefore the advancing system of working. Under the conditions named, it would have been better to have adopted a panel system of working, and worked each panel on the retreating plan. By that means, all of the coal, including that mined from the pillars, could have been hauled out on the intake air without difficulty.

Under the conditions named in the question, it is important to ventilate the levels by separate air splits, carrying the air in to the head of each level and returning it through the rooms in such a manner as to sweep the face of each place, as shown by the arrows in the accompanying figure.

The current, after sweeping the edge of the falls in the pillar workings, will be laden with gas and is conducted at once into the main return airway and passes out of the mine. To avoid hauling any coal on this air, a crosscut should be opened on the cross-entries at a point inby of the pillar section and a switch laid there to take the coal out on the intake air. It will be necessary to put a door on this crosscut and to backswitch the pillar coal to this door to avoid the gas.



Ques.—The ventilating fan at a mine is exhausting, but is made reversible. Explain under what emergency arising underground would the reversal of the ventilating current be of benefit.

Ans.—In the development of a large mine, it frequently happens that the main roads and airways must traverse a large section of old workings that have been abandoned long since and sealed off. In many instances heavy falls have broken the cover to the surface. Since, in the exhaust system, the mine is ventilated under a pressure below that of the atmosphere, the outside air is forced down through the breaks and the gases accumulated in the old workings are driven out into the mine. The reversing of the fan will obviate this difficulty.

Coal and Coke News

Harrisburg, Penn.

The following is a copy of the letter being sent out by the burgesses of the various municipalities in the anthracite region to the saloon keepers of these municipalities:

> Owing to my position as burgess of this municipality, and the fact that the chief industry within the limits of my jurisdiction is the mining and preparation of anthracite coal, which you are aware, cannot be accomplished without considerable risk to the lives and welfare of those employed in this dangerous vocation, I have been requested to send each of you a letter, asking, if you will join in a voluntary movement not to open your respective places of business for the sale of liquor until the hour of 7 a.m. and close the same not later than 11 p.m. The chief reason for making this request is that the various coal mining companies operating in this vicinity are making an earnest effort to reduce the number of serious and fatal accidents which occur at frequent intervals in their mines.
>
> During the year 1914 a large number of serious and fatal accidents occurred in the mines located in this borough. These accidents result in untold suffering of the victims and in addition, in many instances, are the cause of distress and want among the large number of widows and orphans created in each mining village by the untimely death of the father and wage-earner, thus depriving many families of their only visible means of support. You will no doubt agree that when an accident which causes the death of a father or son occurs, not only the family deprived of a wage-earner suffers, but it is a decided loss to our community at large.
>
> It has come under the observation of officials in charge of our mines that many men who have been injured or killed have been frequent patrons of the saloon until a late hour at night and on their way to work in the morning. Mining accident statistics, which are compiled from year to year prove that many of these unfortunate occurrences transpire during the morning hours. Six hundred and twenty-four persons were killed and several thousand injured, in the anthracite mines during 1913. I do not intend to infer that all these accidents were caused by the use of alcohol, but the men in charge claim to have several specific cases to which they can refer whose victims were in the saloon late the night before, and again on their way to work. This is not a prohibition movement, but one of common-sense regulation.
>
> Will you do your part to help it along by keeping your place of business closed between the hours designated?

Many Bills Are Introduced

Members of the legislative committee of the United Mine Workers of the anthracite and bituminous districts expect to urge the legislature to provide for an assistant mine inspector in every district. An assistant inspector, they contend, will double the frequency of inspections and this plan was preferred over that of asking for the creation of 10 additional inspectors.

It is the plan of the mine workers to draw up a bill making the salary of these assistant inspectors $2000, and it is said this bill will be ready for presentation to the Legislature in about two weeks. The lobby to be maintained by the mine workers will devote considerable of its time to the Compensation Act.

During the week two bills were introduced into the legislature, one in the Senate and one in the House, either of which will, if passed, do away with case beer and "family trade" in Pennsylvania. It is explained that the bills' primary object is to prevent the wholesalers, brewers, etc., from sending beer into the mining towns where there are no licensed saloons. The penalty provides for a fine of $100 and the loss of license for five years.

Mr. Garner introduced three bills during the week, one providing that all mine foremen, assistant mine foremen or firebosses, in making examinations of the mines before the men enter their working places in the morning, shall be accompanied by at least one miner. It contended that these foremen are compelled to travel many miles in dangerous and gaseous places and are the only men in the mines for hours at a time, and that many have been overcome by deadly gases or injured while thus making these examinations and have died before any workmen arrived. The bill says that but little cost would be placed on the operators to detail an experienced miner to accompany the foremen on the examinations of the mines.

The second bill provides for the employment of an assistant hoisting engineer for one hour in the morning and one hour in the evening, while men are being lowered and hoisted into the mines. Mr. Garner states that accidents have been caused by the sudden illness or injury to hoisting engineers and in one case an engineer was intoxicated while on duty and no other person was in the engine house to stop the engine and the cage was drawn to the head of the frame and six miners were killed. The bill carries a penalty of $100 for each day of violation.

The third bill of the trio, all of which pertain to anthracite mines, is for the purpose of overcoming the decision of the Dauphin County Court, which sustained the Attorney General in his decision that any one working in anthracite mines was a miner. This bill provides that before any one shall receive a certificate of qualification as a mine foreman or assistant mine foreman, he must have given satisfactory evidence to the board of examiners of at least five years' practical experience as a miner "in the actual work of cutting coal at a face."

PENNSYLVANIA

Anthracite

Mayfield—When the boiler of a mine locomotive burst, while pulling a trip of coal cars on Jan. 27, Mrs. Mary Wazerchak and daughter, aged 14 years, who were riding on the trip, and the engineer as well, were quite seriously burned. The locomotive was the property of the Moosic Mountain Coal Co., and was hauling its last strip of coal cars from Jessup to the breaker at Marshwood.

Scranton—The Delaware, Lackawanna & Western R.R. Co. is having prepared various designs of steel cages which will be submitted to a board of the Lackawanna's mine superintendents within a short time, and one of the designs will surely be adopted. Just what it will cost to install the new style carriage in all the company's mines has not been stated, but it is thought it will be in the neighborhood of $50,000. The argument that mine gases would have a corrosive effect on the steel and tend to weaken the carriage is not given much consideration. It is stated that steel carriages have been in use for five years in some mines and that the improved style has more than paid for the additional cost.

Rappahanock—Over 1000 men and boys were given employment on Jan. 25, by the Lehigh Valley Coal Co. at the new concrete and steel breaker located here, which has been erected on the site of the old Packer No. 5 breaker. Work was started on the breaker about a year ago. The building is absolutely fireproof the floors being of concrete and lighting accomplished by electricity. It is the only breaker in the Hazleton region in which cars are loaded by means of a belt. Both empty and loaded cars will be weighed on the one scale in the new breaker.

Rohrsburg—While digging a skunk out of a hole on his farm, in Columbia County, on Jan. 25, Bert Everett discovered the outcropping of a vein of coal. He started to uncover the measure and from all indications it is over 12 ft. in thickness.

Bituminous

Pittsburgh—On Thursday, Feb. 11, a representative of the Inter-State Commerce Commission will hear testimony of railroads and shippers, pro and con, as to the justice and merits of the so-called "spotting car tariff" sought to be imposed by the carriers in furtherance of previously expressed suggestions of the commission and suspended by that tribunal pending inquiry regarding it. In this connection the commission has caused it to be understood that the burden of proof of the necessity for the charge proposed, rests upon the railroads, and, also that only the testimony of shippers specifically mentioned in the suspended tariff will be heard.

Boswell—The mines of the Randolph Coal Co. are to have their capacity increased by the installation of a complete electrical equipment. With the aid of the new equipment it is expected that the daily output will be sufficient to enable the company to meet the competition of many larger mines.

Iselin—Following an attempt to dynamite the big company store building of the Buffalo, Rochester & Pittsburgh Coal Co., the mines have been shut down. Two attempts were made to dynamite the miners' hall at that place and the home of an official of the coal company before the latest outrage which damaged the big store building considerably.

Ebensburg—Three men were killed and six injured when a rope broke on a loaded trip of coal cars at Delaney, Jan. 28, permitting the cars to run down the slope into an empty train, upon which men were riding.

Mine Inspector Monteith, of the 15th Bituminous District, comprising the northern part of Cambria County and the Greenwich mines in Indiana County, believes that the 1914 production will be about 5,000,000 tons, or 1,000,000 tons less than that for 1913.

Uniontown—Orders were recently issued by the H. C. Frick Coke Co. to fire immediately 1000 coke ovens which have been idle for a year or more. These ovens are scattered throughout the entire Connellsville district, about 20 plants being affected.

Receivers were recently appointed for two more business men of Fayette County, William M. Thompson, brother of J. V. Thompson, and Jasper Augustine, a business associate of the latter. Both men owned coal lands and placed their assets far in excess of their liabilities.

Washington—C. J. Kelley and William Gregory, mine foremen at the No. 2 mine of the Meadowlands Coal Co., recently entered pleas of guilty to violating the mining laws. They had neglected to protect, as required by law, trolley wires at a parting in the mine, since this parting was to be abandoned shortly. They were each fined $40 and costs.

WEST VIRGINIA

Bluefield—It is reported that the sale of the Big Vein Pocahontas Coal Co. has been confirmed by the court. This operation was sold on Dec. 31 at auction and bought in by the bondholders for $356,000. It had been working under receivership for about four years, and it is reported made considerable money during that time.

Huntington—It is said that the Ohio Guyan Valley Coal Co. has arranged to take over the holdings of the Rocky Creek Coal Co. at Chapmansville. This firm is one of the Ohio operators that is seeking coal in the West Virginia field.

VIRGINIA

Pocahontas—The first National Bank of Pocahontas, owner of 14 bonds, of $1000 each, and Andrew C. Snyder, of Baltimore, owner of 12 bonds of the Big Vein Pocahontas Coal Co., recently filed a bill for an injunction in circuit court No. 3, against Thomas C. Boswell, Michael Sheehan, Merville H. Carter, John C. Krug, and Frederick H. Hack, constituting the bondholders' committee, the Big Vein Pocahontas Co., and the Colonial Trust Co., and Elmore D. Jeffrey. The bill alleges that the bondholders' committee undertook to disregard the rights and obligations of one of the members, and held meetings without his knowledge or consultation with him. The bill asked for an injunction to prevent the purchase of the coal lands involved.

ALABAMA

Birmingham—Twenty-eight out of the class of 33 men taking the semi-annual examination for positions of first and second class foremen and fire bosses passed. A. C. Ramcey of Littleton received the highest mark—97—in the first class.

KENTUCKY

Graham—The W. G. Duncan Coal Co. has built and equipped a "moonlight" schoolhouse in which a night school will be conducted. This is a part of the state-wide campaign to wipe out adult illiteracy in Kentucky.

Uniontown—It is reported here that the Deep Water Coal Co. which has extensive plans for taking over a large coal area in this part of the state has asked for a two months' extension of options which the promoters held on large coal holdings. It was reported recently that the deal had been closed but confirmation is lacking.

Whitesburg—J. H. Hopkins and associates of Virginia have taken a lease on the E. M. Webb coal land tract near Sergent on the Lexington & Eastern R.R. It is announced that they will begin immediately on an operation which is to have a daily output of from 800 to 1000 tons.

Harlan—A group of former Alabama operators who some time ago entered this field and leased the Harlan Home Mining Co.'s operation from A. B. and D. B. Cornett and reorganized the company as the Republic Coal Co., have recently undertaken a second development. They have taken an 800-acre lease on land owned by John H. Smith and Judge W. F. Hall and will build one mile of railroad and begin operating in the spring. This group of operators is headed by E. O. Guthrie.

OHIO

Bellaire—The Purseglove-Maher Coal Co., which recently made arrangements for opening a new mine in Logan County, W. Va., has shipped its horses to the new operation, at which a large amount of work has already been done. A new railroad track is to be constructed to the mine, and it is said that the operation will be ready for work within a few weeks.

Nelsonville—The Robbins Coal Co. which has a normal output of 600 tons daily has closed down its mines indefinitely, because of lack of business.

Rendville—The shutting down of the mines of the Sunday Creek Co. in the Hocking Valley is the cause of much suffering and destitution among the miners of that section. Recently the chairman of the board of education visited Columbus and appealed for donations of food, clothing and money to relieve the suffering. Many of the mines have been closed down entirely and others are being operated with a small force of men.

ILLINOIS

Duquoin—The mining property of the Benton District Coal Co. at Hanaford which recently went into the hands of a receiver, has been sold for $60,000. This deal was completed by Herman Rea of Christopher, receiver of the property.

Edwardsville—The hoisting apparatus at the mine of the East Side Coal Co. broke recently when the cage, with four miners upon it, was 130 ft. from the bottom. After dropping a few feet, the safety clutches stopped the fall. This is the second case in about three weeks of the same kind of an accident happening to mines in this county.

Benton—Engineers for the Illinois Central R.R. are completing a survey of the proposed new line from Hanaford, east of Benton, to West Frankfort, to the Franklin County coal fields. The proposed branch will be 7 miles long and, it is understood, will be the beginning of a new line of the Illinois Central extending from Hanaford southeast through the Franklin County coal field, and through the eastern section of Williamson County, down into the Saline field in and around the Harrisburg district. It is understood that the extension into the Saline County field will not be completed at this time, but it will only be a matter of a few years until the eastern field is open, and the Illinois Central is preparing to get its track in through this virgin coal field.

ARKANSAS

Bates—The Bates Coal Mines have been leased for five years by local coal miners who will renew active operations. These mines have, in the past, been operated at a loss but the miners believe they can make a profit.

Fort Smith—The deal for the purchase of the Bache-Denman Coal Co.'s Hartford Valley holdings by the United Mine Workers of America, has not been consummated. It is believed however that this deal will be closed within a short time.

FOREIGN NEWS

St. Johns, Newfoundland—An expedition to discover coal in the Hudson Bay district which may be utilized in connection with the proposed opening of the Hudson Bay Ry. is understood to be the mission of the schooner "Laddie" equipped here. This expedition is being financed by the Canadian railway operators, Mackenzie & Mann. One of the most essential factors to the successful carrying out of the Hudson Bay project will be the securing of an adequate coal supply for both steamers and trains. When the road reaches the seaboard and terminals are constructed at Fort Nelson, provision will be made for the storage of large quantities of coal both from western Canada and Cape Breton but if a supply could be secured at any point comparatively accessible for ships plying on the Hudson Bay route it would have an immense advantage.

PERSONALS

W. C. Franz has been made president of the Lake Superior Coal Co. and also the Canton Coal Co. a subsidiary.

B. F. Nigh, secretary of the Michigan-Ohio-Indiana Coal Association is busy getting up the annual year book of the organization which will be issued about the middle of April.

Kingdon Gould of New York, president of the Consolidated Coal Co. of St. Louis, and the Western Coal & Mining Co., has returned from an extended trip of examination at the various coal properties of this company in the Middle Western States.

Earl F. Scott, with offices at 702 Candler Bldg., Atlanta, Ga., has been appointed representative for the State of Georgia by the Terry Steam Turbine Co., of Hartford, Conn. H. A. Rapelye, in charge of the Pittsburgh office, is now located at 1624 Oliver Building.

George A. Harper, who was connected with the Buffalo office of Coxe Bros. & Co. when it went out of the western business and since mainly in the employ of the Lehigh Valley Coal Sales office, has been made representative of the latter company in western Michigan, with office in Grand Rapids.

P. A. Coen, general sales manager of the Sunday Creek Co. has announced the appointment of M. J. Gallagher as city sales agent in the place of E. A. Cole & Co., which formerly acted in that capacity. Mr. Gallagher has been a traveling salesman for the company for a number of years.

G. L. Douglas, assistant general sales agent, in charge of the St. Louis office for the Consolidated Coal Co. of St. Louis and the Western Coal & Mining Co., with mines scattered throughout Illinois, Missouri, Arkansas, and Kansas, has resigned to take a similar position with the Devoy & Kuhn Coal & Coke Co., St. Louis.

Arthur C. Vicary, formerly of Lorain, Ohio, has recently assumed the duties of sales manager of the steam shovel department of the Ball Engine Co., of Erie, Penn. Mr. Vicary has been engaged in the design and sale of steam shovels for years, and is widely known to steam shovel users, particularly in the eastern section of this country.

W. D. Monsarrat, formerly head of the operating department of the Sunday Creek Co. has established an engineering office in the Hardman Building at Columbus, Ohio. Mr. Monsarrat will devote his time to outside construction work such as shaft sinking, slope driving, etc., in which he has had considerable experience. He is prepared to submit bids on such work either in the United States or Canada.

E. S. White, for the past few years Southwestern representative for the Hart-Williams Coal Co. of Chicago, has been appointed general freight and passenger agent, to succeed W. H. Ogborn, of the Illinois Southern Ry. Co., with headquarters in St. Louis. Previous to his connection with the Hart-Williams Coal Co., Mr. White was assistant to one of the officials of the Missouri Pacific-Iron Mountain System.

R. E. Eggebrecht, for the past three years sales manager of the Devoy & Kuhn Coal & Coke Co. in St. Louis, will shortly assume a similar position with the Southern Coal, Coke & Mining Co. of St. Louis. Previous to his connection with Devoy & Kuhn Coal & Coke Co., Mr. Eggebrecht was connected with the Standard Collieries Co., with mines at Marion and Johnston City, Illinois, as vice-president. Previous to that he was A. G. F. A. of the Missouri Pacific-Iron Mountain System, in charge of coal traffic.

J. W. Hardy, for many years connected with various western railroads, and especially the Frisco, as a locomotive fuel expert, and for the past two years fuel engineer for the Southern Coal, Coke & Mining Co. of St. Louis, will sever his connections with that company shortly, to take the southern sales office for the West Kentucky Coal Co. at New Orleans. This office is created for the purpose of taking care of Southern trade of the West Kentucky properties, and the growing river business, and to expedite the handling of this company's product in an export way, on account of the opening of the Panama Canal. He will be succeeded as fuel engineer for the St. Louis company by J. E. Richmond, for some time past connected with this company.

OBITUARY

Col. S. M. Dalzell, general manager of the Spring Valley Coal Co., with mines at Spring Valley, Seatonville and Dalzell, Ill., died on Wednesday morning, Jan. 25, at his residence, 430 Grand Boulevard, Chicago. He had been suffering from physical infirmities for a long time, and his death although regretted by his many friends was not unexpected. Mr. Dalzell was long and favorably known in the coal trade of Illinois, and from Dec. 23, 1897, to Dec. 21, 1900, was president of the Illinois Coal Operators' Association, the duties of which office he performed with signal ability and success. He was born at Hartstown, Penn., Dec. 3, 1850, and up to recent years had always been one of the important factors in handling labor questions from the operators' standpoint.

RECENT COAL AND COKE PATENTS

Coal Recording Device. A. W. Dodge, Two Harbors, Minn. 1,121,234. Dec. 15, 1914. Filed Apr. 21, 1913. Serial No. 762,589.

Smoke Eliminator. C. Cable, Elkhart, Ind. 1,120,129. Dec. 8, 1914. Filed Mar. 24, 1914. Serial No. 826,969.

Boiler. L. D. Lovekin, Philadelphia, Penn.. 1,119,025. Dec. 1, 1914. Filed June 25, 1913. Serial No. 775,662.

Smoke Consumer. E. C. Heimlich, Detroit, Mich. 1,120,484. Dec. 8, 1914. Filed Apr. 1, 1914. Serial No. 828,665.

Gas Producer. P. G. Schmidt, Olympia, Wash. 1,116,131, Nov. 3, 1914. Filed Mar. 26, 1913. Serial No. 757,020.

Coal Breaker. M. H. McTurk, Philadelphia, Penn. 1,121,931. Dec. 22, 1914. Filed May 31, 1912. Serial No. 700,688.

Coal Pocket. G. D. Curtis, New York, N. Y. 1,121,328. Dec. 15, 1914. Filed Jan. 16, 1909. Serial No. 472,723.

Mine Safety Lamp. F. Farber, Dortmund, Germany. 1,116,048, Nov. 3, 1914. Filed Dec. 2, 1913. Serial No. 804,274.

Coal Cutting Machine. M. Mysliwicz, Wehrum, Penn. 1,116,907, Nov. 10, 1914. Filed Mar. 6, 1913. Serial No. 752,350.

Smoke Recorder. H. C. Alger, Chicago Heights, Ill. 1,122,229. Dec. 22, 1914. Filed Apr. 6, 1914. Serial No. 829,958.

Method of Mining Coal. E. C. Morgan, Columbus, Ohio. 1,116,355, Nov. 3, 1914. Filed Aug. 4, 1905. Serial No. 272,637.

Dumping Grate for Furnaces. E. Gibson, Jersey City, N. J. 1,116,409, Nov. 10, 1914. Filed Jan. 21, 1914. Serial No. 813,391.

Coal Picking Apparatus. F. H. Emery, Scranton, Penn. 1,119,586. Dec. 1, 1914. Filed Apr. 7, 1914. Serial No. 830,152.

Coal Washing Machine. W. W. Cooper, Fortyfort, Penn. 1,121,715. Dec. 22, 1914. Filed Sept. 8, 1914. Serial No. 860,655.

Chain Grate—P. L. Crowe and A. Frankenheim, New York, N. Y. 1,115,904, Nov. 3, 1914. Filed Mar. 9, 1914. Serial No. 823,388.

Coke Oven Door. J. A. McCreary, Connellsville, Penn. 1,121,385. Dec. 15, 1914. Filed Dec. 12, 1913. Serial No. 806,308.

Boiler Grate. D. K. Briggs and T. N. Smith, Portsmouth, Va. 1,121,791. Dec. 22, 1914. Filed May 23, 1913. Serial No. 769,529.

Furnace. R. F. Almirall and C. G. Armstrong, New York, N. Y. 1,120,993. Dec. 15, 1914. Filed June 4, 1910. Serial No. 564,952.

Sectional Shaking and Dumping Grate. C. T. Coe, Albany, N. Y. 1,121,001. Dec. 15, 1914. Filed Jan. 30, 1909. Serial No. 475,091.

Locomotive Fire Box. J. Black and J. Frama, Glasgow, Scotland. 1,119,490. Dec. 1, 1914. Filed Mar. 7, 1914. Serial No. 823,190.

Means to Prevent Gas Explosions in Coal Mines. H. Hall, Wylam, Ala. 1,119,427. Dec. 1, 1914. Filed Feb. 2, 1914. Serial No. 816,121.

Mining Machine. C. E. Davis, assignor to Goodman Mfg. Co., Chicago, Ill. 1,121,002. Dec. 15, 1914. Filed Oct. 6, 1910. Serial No. 585,550.

Charging Device for Gas Producers. J. A. Herrick, Newark, N. J. 1,119,280. Dec. 1, 1914. Filed Apr. 15, 1913. Serial No. 761,179.

Securing Device for Miner's Drills. J. W. Shallenberger, Canal Fulton, Ohio. 1,115,594, Nov. 3, 1914. Filed Sept. 26, 1913. Serial No. 791,919.

Process of Producing Gas from Bituminous Fuel. O. C. Berry, Glendale, Ohio. 1,117,217, Nov. 3, 1914. Filed May 6, 1908. Serial No. 431,177.

Apparatus for Treating Smoke and Fumes. J. Mercer, New Brighton, England. 1,121,746. Dec. 22, 1914. Filed May 20, 1912. Serial No. 698,474.

Clinker Grinder and Discharger for Furnaces. O. C. Woolson, New York, N. Y. 1,121,888. Dec. 22, 1914. Filed Jan. 30, 1914. Serial No. 815,351.

Mining Machine. F. L. Sessions, assignor to Jeffrey Mfg. Co., Columbus, Ohio. 1,122,034. Dec. 22, 1914. Filed Jan. 7, 1903. Serial No. 138,158.

Apparatus for Quenching Coke. H. Koppers, assignor to H. Koppers Co., Chicago, Ill. 1,121,376. Dec. 15, 1914. Filed Feb. 1, 1913. Serial No. 746,098.

Automatic Stoker. D. T. Williams, assignor to Standard Stoker Co., Wilmington, Del. 1,118,985. Dec. 1, 1914. Filed Apr. 18, 1914. Serial No. 832,730.

Locomotive Boiler Furnace. C. B. Moore, assignor to American Arch Co., New York, N. Y. 1,115,955, Nov. 3, 1914. Filed Dec. 18, 1911. Serial No. 666,353.

Grate. A. B. Coates, assignor to Economy Forced Draft Slack Burner Co., Ellsworth, Kan. 1,119,808. Dec. 8, 1914. Filed June 17, 1913. Serial No. 774,226.

Stoker. H. B. Holt, assignor to Rosedale Foundry and Machine Co., Pittsburgh, Penn. 1,122,203. Dec. 22, 1914. Filed Dec. 8, 1913. Serial No. 805,318.

Tubular Recuperator for Retort Coke Ovens. C. H. Hughes, assignor to Semet-Solvay Co., Solvay, N. Y. 1,120,147. Dec. 8, 1914. Filed Jan. 7, 1910. Serial No. 536,807.

Steam Boiler Construction. J. W. MacDonald and D. W. Robb, assignors to International Engineering Works, Montreal, Can. 1,120,071. Dec. 8, 1914. Filed Dec. 21, 1913. Serial No. 804,221.

TRADE CATALOGS

Waterbury Co., 80 South St., New York. Catalog. "Fiber-clad Wire Rope." Illustrated, 24 pp., 3½x6 in.

Pelton Water Wheel Co., 90 West St., New York. Bulletin No. 8. "Water wheels." Illustrated, 64 pp., 6x9 in.

CONSTRUCTION NEWS

Kirksville, Mo.—The Kirksville Commercial Club has a proposition well under way to extend the Big Creek R.R. to coal and clay deposits near here, and plans are made to open up these deposits in the spring.

Chicago, Ill.—It has been announced that the large tract of land which the Susquehanna Coal Co. purchased some time ago on the Calumet River at 114th St., will be improved with docks and coal handling equipment at a cost of approximately $300,000. A 1600-ft. wharf will be built while the yards will have a daily capacity of 8000 tons.

Birmingham, Ala.—Tentative plans have been agreed upon to extend a railroad from Birmingham to the Warrior River so that transportation may be secured. There will also be developments near the river, of considerable importance. All appearances seem to indicate that there will be improvements in the Warrior field of considerable magnitude within a short time.

Columbus, Ohio—At the annual stockholders meeting of the John M. Taylor Coal Co. of Columbus the announcement was made that the Taylor-Williams Coal Co., the retail department, will soon start the erection of a modern plant on Cleveland avenue, opposite the U. S. Barracks. This is made necessary by the rapid increase in the business. The plans provide for storage bins, yards, barns and an elevated track.

NEW INCORPORATIONS

Temple, Texas—The Bastrop Lignite Coal Co. has been incorporated with a capital of $75,000 to develop coal properties.

Cleveland, Ohio—Papers have been filed with the secretary of state reducing the capital of the Goshen Coal Co. from $1,000,000 to $5000.

Wellston, Ohio—The Blue Jay Coal Co. has filed amended articles of incorporation increasing its capitalization from $10,000 to $15,000, to finance more extended operations.

Oklahoma City, Okla.—The Ross-Caldwell Coal Mining Co. has been organized at Lehigh with a capital of $6000. The incorporators are A. K. Ross, Ray Caldwell, and Tom Mitchman, all of Lehigh.

Roanoke, Va.—The Eastern Kentucky Block Coal & Fuel Co. has been incorporated with a minimum capital of $10,000 and a maximum of $80,000, to engage in coal mining. The officers are W. O. Brothers, president, H. V. Brothers, secretary, both of Honaker, Va.

Crumpler, W. Va.—The United Pocahontas Coal Co. which is to have its chief works in the North Fork district of McDowell County, has been organized with a capitalization of $500,000. The incorporators are A. B. Rice, Hall Kilpatrick, J. L. Ashworth, A. A. Bosh, and C. B. Hoyt.

Quebec, Canada—The British Columbia Skeena Coal Co., Ltd., has been incorporated, capitalized at $1,000,000, with head office in Quebec by Senator P. A. Choquette, Hon. N. Garneau, J. G. Scott and J. T. Ross, to conduct general mining operations and take over the assets of the British Columbia Anthracite Syndicate.

Chattanooga, Tenn.—The Craney Creek Coal Co., owning land in Kentucky and chartered in that state, has applied for a Tennessee charter, listing its capital at $100,000. The company is allied with the Continental Coal Co., a local concern, and its incorporators are C. C. Moore, J. D. Carlin, O. P. Darwin, John E. Patton, W. E. Wilkerson.

Charleston, W. Va.—The Ivy Branch Coal Co., of Charleston, has been granted incorporation papers. The company will have its chief works in the Washington district of Lincoln County, and is capitalized at $50,000. The incorporators are A. E. Moore, John W. Moore, Angus MacDonald, Leo F. Moore, Hubert S. Moore, all of Charleston.

INDUSTRIAL NEWS

Louisville, Ky.—Announcement is made that the Kentucky, Land, Lumber & Mineral Co. is to dissolve, and claims against the firm, as well as debts owing it, are called for.

Birmingham, Ala.—Announcement has been received here that under the new ruling by the terminal companies, cargo and bunker coal will be held free for 10 days at New Orleans. This is interesting to coal men here who sell large quantities of bunker coal at New Orleans.

Cleveland, Ohio—Federal Judge Clark recently appointed receivers for the East Grafton Coal & Coke Co. and the Triona Coal & Coke Co., West Virginia corporations with offices in Cleveland. Lack of capital is blamed for the financial embarrassment of these firms.

Olcott, W. Va.—The Black Band Fuel Co. has purchased the property formerly owned by the Olcott Coal & Iron Co. operating mines at Olcott, W. Va. All matters pertaining to the Olcott property should hereafter be addressed to the Black Band Fuel Co., 1 Broadway, New York.

New York, N. Y.—The withdrawal of steamers used in the coal trade between Chesapeake Bay ports and New York for use in the trans Atlantic trade has created a demand for sail tonnage, and incidentally brought about increases in the freight rate amounting to about 25 per cent. The average time taken by sailing vessels from Norfolk to Boston is about three weeks so that it will require six schooners of 3000 tons capacity each to make up for the loss of one 6000-ton steam collier.

South Bethlehem, Penn.—An event in industrial affairs of this vicinity was the charging on Jan. 26, of 106 newly built coke ovens at the Lehigh coke plant it being the first battery of four comprising 424 ovens which are being built. Already half of the 424 ovens have been erected, but only 106 have been fired. These new coke ovens are taking the place of the old four-battery systems which were built by the Didler-March Co., a German concern and which proved a distinct failure.

Washington, D. C.—The Grand Rapids, Michigan, Association of Commerce recently complained to the Interstate Commerce Commission about the unfair rates of the Ann Arbor and other railroads on soft coal from mines in Pennsylvania, West Virginia and Ohio, to Grand Rapids, alleging that rates to Detroit and Toledo were proportionately lower than the shorter haul warranted, and asked that new rates be established from the coal fields to Michigan points as those used at present are prejudicial.

Washington, D. C.—By a recently announced decision the Interstate Commerce Commission notified the Illinois Central and other railroads that their proposed increased rates on coke in carload lots from St. Louis, Chicago, Milwaukee, and other points to destinations in Minnesota other than Duluth, in Wisconsin, Iowa, and South Dakota, are justified. The proposed increased rates on the same commodity from the same points of origin to Duluth, Minnesota, however, were held to be unreasonable to the extent that they exceed $2.15 per ton. The present rate to Duluth is $2, and the proposed rate is $2.25. The changes take effect on Feb. 28.

Cincinnati, Ohio—Petitions have been filed in the United States district court by receivers Harmon and Smith, of the Cincinnati, Hamilton & Dayton R.R., asking for the appointment of receivers to operate the Cincinnati, Indianapolis & Western Ry. Co. The petitions were filed in foreclosure proceedings instituted by bondholders represented by the Central Trust Co. and the Equitable Trust Co. of New York, against the company mentioned. The receivers of the C. H. & D. have been operating the other road, which is a connection of the former, under an agreement between the two companies, and report that its operation has been unprofitable, resulting in a deficit, and that it is now necessary to spend $140,000 for repairs to a bridge over the Wabash, and $400,000 at Indianapolis.

Coal Trade Reviews

General Review

Severe weather relieves the pressure on anthracite and working schedules are increased. Uncertainties developing in bituminous. Spectacular advance in ocean freights causing general uneasiness. The trend of conditions on new contracts generally satisfactory.

The inclement weather of this week was a potent stimulus to the anthracite market, which was beginning to show distinct indications of a break. The domestic grades are all in easy supply, the demand centering entirely on the steam sizes, the high grade of buckwheats being the leaders. Mining operations have been increased somewhat this week, and a continuance of the severe weather will result in the anthracite trade rounding out the coal year in much better form than has recently been anticipated.

Though bituminous apparently continues as heavy as ever, there are uncertainties developing which may cause a readjustment in the situation. The storms and heavy weather have not only stimulated consumption, but have delayed the movement, and consumers are showing slightly more interest in the market.

The spectacular advance in Coastwise freights has ceased for the time being, though there has been no relapse back to normal levels, and all the indications point to a still further increase; this is one of the most interesting phases of the general situation at the present time, since it means that the market for the Hampton Roads coal may soon be restricted to relatively narrow limits, causing a radical readjustment in the customary channels of trade. The accumulations at the Tidewater piers continue relatively large, and substantial cuts are doubtless being made where coal is on demurrage.

Preliminary negotiations on new contracts are being reported in the Pittsburgh district, and it is generally believed among well informed observers that prices will be on the same basis as last year. On current business the situation is slightly stronger; the manufacturing demand has toned up appreciably, particularly at the steel mills and the railroads are using a larger tonnage. Complications are rising on Canadian business over the question of exchange.

The heavy snows and low temperatures through Ohio have forced the buyers into the market again, though many of them expected to be able to hold out over the balance of the season. Orders are not large as a rule, but there is a decidedly healthy tone, and prices are relatively firm with the possible exception of the steam grades. A judicious curtailment of production, however, will be necessary to put the market on a firm basis.

The recent sluggishness in the Middle Western market has given way slightly under the influence of the exceedingly cold weather, though the large accumulations have not yet been much affected, and the mines are still working under curtailed schedules. The high grade fuels are relatively firm, but there is a general weakness in other directions which it is doubtful if even a long stretch of severe weather would materially affect.

ATLANTIC SEABOARD

BOSTON

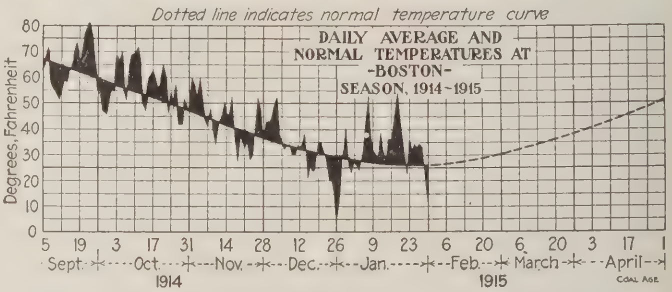
Further advance in water freights discounted; prices being made only by agencies that control transportation. Georges Creek and Pennsylvania grades show firmness for season delivery. Anthracite trade not improved.

Bituminous—There is less alarm on the part of shippers than a week ago. The interests that own their own transportation are actively in pursuit of business and are understood to offer contracts at 12@15c. up from last year either alongside or on cars. The other shippers appear to be marking time until water freights have settled into something like a reasonable season basis. High ocean freights still prevail, but it develops that there is a certain amount of steam tonnage that will not be available for over-sea business.

At Hampton Roads there are still ample supplies of Pocahontas and New River, with a very quiet demand; f.o.b. prices show practically no change. The slow movement of barges and sailing vessels has affected the volume of shipments Coastwise, and inquiry for export is only spasmodic and transient. Pocahontas and New River shippers for the most part are rather discouraged.

The contract basis, on cars Mystic Wharf, Boston, for inland delivery, is understood to be $3.90. This is 12c. up from the price at which similar contracts were closed last year and will very likely bring all-rail coals into closer competition. Spot prices on cars are firmer in consequence of the higher water rates, but there is no special activity.

The Georges Creek shippers are apparently very conservative about making delivered prices. They have done so only in a few cases, and so far have not made a rate of less than 90c. from Baltimore and Boston. Anthracite-carrying barges are still being freely chartered to enable the Georges Creek people to catch up with their orders. Prices on this grade are very firm.



Pennsylvania operators are more hopeful than for several months. This attitude is reflected in the prices named for future delivery. There is some prospect of better demand for the more favorably regarded grades and sales agents are carefully going over the ground. Meanwhile, spot prices continue on about the same level.

Water Freights seem to be marking time at $1, Hampton Roads to Boston, 2500 tons upward. The higher rates seem to have drawn out a number of bottoms that were not in evidence a week ago, and some of the brokers are busy trying to get orders; $1 to Boston has also been named as a season rate on certain types of steamers as well as schooners, but it is not believed that any tonnage has actually been closed at that rate. The Reading barge rate on bituminous from Philadelphia was advanced from 75 to 80c. to Boston points, effective Feb. 1.

Anthracite is expected to profit from the colder weather of the past week. Among the shippers all sizes are in plentiful supply.

Prices on bituminous at wholesale are about as follows:

	Clearfields	Cambrias Somersets	Georges Creek	Pocahontas New River
Mines*	$0.90@1.50	$1.15@1.65	$1.67@1.77	
Philadelphia*	2.15@2.75	2.40@2.90	2.92@3.02	
New York*	2.45@3.05	2.70@3.20	3.22@3.32	
Baltimore*	....	....	2.85@2.95	
Hampton Roads*	....	....	....	$2.65@2.75
Boston†	....	....	....	3.83@3.95
Providence†	....	....	....	3.73@3.78

* F.o.b. †On cars.

NEW YORK

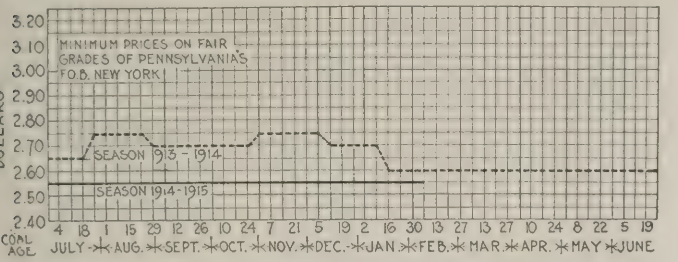
Bituminous continues quiet, with no definite indications for any improvement in sight. Interest centering on new contracts. Anthracite operations somewhat better and colder weather stimulates the movement.

Bituminous—Cold, stormy weather, accompanied by heavy fogs has interrupted the movement to some extent and caused a spasmodic demand in certain quarters, but the general situation continues monotonously the same. The operators are still holding coal rather close at the mines, but in spite of this, an occasional lot comes down on consignment and not infrequently results in a forced sale on demurrage. The bunkering trade livened up somewhat during the past week. Mine operations seem to be on about the same basis as for the past several weeks. The outlook for the current month is regarded as moderately favorable.

Negotiations have hardly yet started on contracts, although some few of the less important ones have been signed up.

Prices on these range at the same levels as last year, and it is generally felt in well informed quarters that these will be the ruling figures on new contracts, particularly as regards the higher grade standard fuels. In a comparatively short time contracting will be actively under way; the cold weather, together with the near approach of the customary contracting period, is beginning to stimulate interest among buyers and inject a little life into the situation as it is.

Prices continue unchanged. One small sale of good grade of Pennsylvania coal was noted during the week at our top quotations, $2.80, and we continue previous quotations on the same basis, as follows: West Virginia steam, $2.35@2.55; fair grades, Pennsylvania, $2.55@2.65; good grades of Pennsylvania, $2.70@2.80; best Miller Pennsylvania, $3.10@3.15; Georges Creek, $3.15@3.25.



Anthracite—Conservative hard-coal dealers are not missing any of the opportunities presented by the recent cold snaps to unload their coal, although occasionally one is found who is keeping a substantial surplus in hopes of a more active market later. That the situation is somewhat better, however, is indicated by the increased working schedule at the mines, which was notably larger this week. As a general thing the business may be regarded as good with companies having the more favored grades of coal, which are moving off briskly. In some instances it is noted that the large companies are even picking up some of their stocks.

Of the prepared sizes, nut is in the most active demand, although the situation is generally easy on all grades. The heavy call for stove coal of some time ago has completely disappeared. The good grades of buckwheat are in active demand in all directions and are the strongest feature of the market, with the other steam sizes continuing fairly active.

Far-sighted observers are already beginning to contemplate the possibilities of a long suspension next April, and preparations for such a contingency are receiving consideration. Should business conditions continue as bad as at present, it is obvious that the producers will make a determined stand against the customary advance demanded by the unions, which will result in a bitter, and very probably a long-drawn-out struggle.

The market is quotable as follows:

	Upper Ports		Lower Ports	
	Circular	Individual	Circular	Individual
Broken	$5.10	$4.60@5.10	$5.05	$4.55@5.05
Egg	5.35	4.85@5.35	5.30	4.80@5.30
Stove	5.35	5.05@5.35	5.30	5.00@5.30
Chestnut	5.60	5.30@5.60	5.55	5.25@5.55
Pea	3.55	3.40@3.55	3.50	3.35@3.50
Buckwheat	2.80	2.60@2.80	2.50@2.75	2.35@2.75
Rice	2.30	2.20@2.30	2.00@2.25	1.75@2.25
Barley	1.80	1.70@1.80	1.75	1.55@1.75

BUFFALO

Bituminous continues as discouraging as ever. Railroad buying light. Recession in prices on contracts. Anthracite business fair but congestions are now occasionally noted.

Bituminous—Trade is very dull; it promises now and then to improve and shippers will be encouraged by a good day or two and then it settles back apparently on the bottom again. But it is still noted that shippers continue hopeful. The mines are experiencing great difficulty in finding an outlet for the coal that should be mined, if only to keep the men from going hungry. It is difficult to find business enough to keep the mines running half time and operators are pushing the jobbers hard to sell coal. Consignment coal is a particularly bad feature of the situation and consumers are beginning to rely on this to meet their current requirements.

The Canadian trade is especially heavy on account of the dispute over the discount demanded by the banks on Canadian paper, as buyers and sellers make every effort to avoid this extra cost. It was said at the outset that this discount was not likely to last, but it has not disappeared yet and it may continue indefinitely, especially if the slow pay in Canada has anything to do with imposing it.

Railroads are not buying any more coal than formerly and this is having a decidedly depressing effect on the situation. The contract situation is not encouraging; consumers are showing little interest as they expect to get figures 10c. or so lower than last year while operators and jobbers are more than pleased when they can close at old prices. At the same time there is scarcely anyone connected with the trade who does not believe that coal will go up before fall.

There is no change in the price of bituminous. Some shippers have urged a reduction in the accepted circular but others stoutly oppose it, saying that they are getting these prices. Figures therefore remain at $2.80 for best Pittsburgh lump, $2.70 for three-quarter, $2.55 for mine-run and $2.15 for slack. Allegheny Valley coal sells for about 25c. less than Pittsburgh.

Anthracite—The very cold weather of late has improved the demand, though it is not yet satisfactory to the shipper who expects to sell as much coal as usual. There are some efforts to urge sales on the part of certain companies by advertising in local papers. Reports from Western sales centers are encouraging and it does not appear that coal is accumulating here, though shippers of independent anthracite say that at certain Eastern junction points there is more congestion than is good for the trade. The local Buffalo market is rather quiet, though weather conditions are of the best.

There is a better demand for chestnut than any other sizes, stove being decidedly quiet, with egg doing better than it was in the fall. The small sizes are finding bituminous competition sharp enough to hurt them materially.

The loading of anthracite into Lake vessels for winter storage continues slowly. There is now more than 100,000 tons afloat.

TORONTO, CAN.

Bituminous dull, but anthracite is showing some activity.

There has been a good, steady demand for anthracite for domestic purposes, weather conditions being favorable for a brisk trade. While the market for bituminous lump is rather quiet, screenings are much in requisition, with short supplies on hand and little coming forward.

Quotations are as follows, with an upward tendency for screenings: Retail, anthracite, egg, stove and nut, $8; grate, $7.75; pea, $6.75; bituminous steam, $5.25; screenings, $4.35; domestic lump, $6; cannel, $7.50. Wholesale, f.o.b. cars, three-quarter lump, $3.78; screenings, $2.79.

PHILADELPHIA

No improvement in anthracite. Discouraging features still continue. Bituminous shows little or no change.

While conditions were fair for the consumption of the fuel during the past week there is apparently no great need for coal and the same lassitude of the past six weeks still prevails. There is practically no size in any great demand, with the possible exception of buckwheat, which, under restricted mining, is short of the market requirements. Continuous soliciting is required to move even the curtailed output now in effect and it is understood that surplus coal is available, both at Tidewater and along the line. Dealers are well fixed in the matter of supplies, and from the present outlook, the trade is likely to continue sluggish for the balance of the winter season.

While reports of concessions are heard, ranging from 10 to 40c. per ton, prices on the whole are being maintained at circular. Prices at Tidewater rule about as follows:

	Circular	Individuals
Broken	$4.75	$4.50
Egg	5.00	4.75@4.85
Stove	5.00	4.90@5.00
Chestnut	5.25	5.00

Bituminous—There is no change in the soft-coal situation. Spot demand is light, and prices range about the same as last week. It is understood that contract requirements have been slightly increased, but in the main, nothing important has developed in this branch of the trade.

BALTIMORE

Poor showing in December export trade, but movement is improving. Dull market conditions for both hard and soft coals. An excellent bunker business the only local redeeming feature.

Export figures show that December was the worst month in the foreign movement during 1914. A total of but 50,712 tons was recorded. A considerable improvement is indicated by the number of vessels loaded for January, however, with good prospects for current month. The January total will probably run in excess of 70,000 tons.

The market is dull in both the hard- and soft-coal trades. From West Virginia comes the statement through local headquarters that gas coal and slack are both in poor demand. Steam coals from West Virginia and Pennsylvania were also in slow call. There is very little market for low grade coals and prices are generally low.

The past two weeks have seen little change in quotations to the trade at the mines. While there is considerable variation under press of individual necessity, quotations are about as follows:

West Virginia—Kittanning, $1.20; Freeport, 80@85c.; Fairmont, gas three-quarter, 85c.; run-of-mine, 80c.; slack; 60@65 cents.

Pennsylvania—South Fork best, $1.40; Cambria County, $1.25 with ordinary grades 95 cents; Somerset best, $1.25, fair grades $1.10@1.15.

Maryland—Ordinary steam coals, 80 to 85c.; Georges Creek regular production, $1.60 with select grades, $1.70 and some special lump grades at $1.90.

HAMPTON ROADS

Tidewater situation showing some little improvement. Prices about circular. Dumpings for month of January more than December.

Dumpings over Tidewater piers were hardly normal last week but still in excess of the previous week. There have been several export cargoes for Havana, Santiago, Cristobal, Pernambuco, and Italian ports. The coastwise movement has as usual been heaviest to Boston, Providence and Portland with other cargoes to the smaller New England ports. The placing of several of the large coastwise steamers in the foreign trade has caused a better demand for schooners and barges; a number of the former which have been tied up are again in the trade. As noted some weeks ago schooners are replacing steamers on some of the South American shipments, another of these vessels having been loaded here during the week for Pernambuco, Brazil.

Whether general conditions will be so dull that no great shortage of transportation will be felt along the coast, and whether there will be further advances in ocean freights, remains to be seen. However, so long as one or two agencies can name prices delivered at Boston only 15c. up from last year, and other agencies are required to pay 30c. up for what bottoms are available, it is easy to see it will be slow business for the houses that are in the latter position.

It is difficult to ascertain exactly what prices are being quoted at tide just at this time and although there is still somewhat of an accumulation on the railroad yards it is not believed any great cut is being made. It is just possible some suppliers with excess coal on demurrage are making some slight concession but under present conditions the opinion seems to be that price cutting would not increase the demand to any extent.

With the amount of vessel tonnage in port and that due it is believed the total dumpings for January will be around the million-ton mark. To the morning of Jan. 30, the Virginian Ry. had dumped 236,514 tons and the Chesapeake & Ohio Ry. 214,163 tons; the Norfolk & Western Ry. figures were not obtainable.

Recent steamer clearances have been noted as follows:

Vessel	Destination	Vessel	Destination
Corcovado[1]	Rio de Janeiro, Brazil	Galveston[1]	Santiago
Liguria[2]	Elba, Italy	Oilfield[2]	Canal Zone
Tyskland[2]	Havana, Cuba	*Edw. E. Briry[2]	Bernambuco, Brazil
Beltier[1]	Unknown	Vesuvio[1]	Unknown

[1] Loaded at Newport News. [2] Loaded at Norfolk. * Schooner.

OCEAN FREIGHTS

Market steadies down though rates are still generally higher. Sailing vessels most advantageous to Rio but these rates are also advancing rapidly. High point not reached yet.

There was a pause in the freight market during the last week and rates to Mediterranean and South American ports could have been shaded slightly. This does not apply to outward coal to Cuban and West Indian ports. These rates held firm, owing to the still further advance in sugar freights from Cuba.

A steamer was chartered to load coal at Baltimore for the River Plate at $8.88 at which figure a number of others were offered. A large steamer was also chartered for coals, from a United States port to Italy, on time charter, shippers agreeing to re-delivery United Kingdom, which makes the outward freight rate uncertain, but it is estimated at about $10.80 which rate can be shaded.

A number of additional sailing vessels were chartered, from Virginia to Rio, at $5.35, charterers paying all foreign port charges. At present it would seem preferable to ship Rio coal by sail rather than by steam, as the rates are very much lower. Sail rates on the coast, however, are advancing, and this will no doubt have an effect on offshore rates.

A steamer was chartered, from Baltimore to Guantanamo at $2.75, and another from Norfolk to Bermuda, at $3.75, and if the war continues for any length of time, rates will undoubtedly reach new high levels.

The market is hardly quotable, but approximate steamer prices on coal may be taken as follows:

To	Rate	To	Rate
Havana	**$2.75**	Guantanamo	**$3.25**
Cardenas or Sagua	3.25@3.50	Demerara	**5.50**
Cienfuegos	**3.25**	Bermuda	3.75@4.25
Port of Spain, Trinidad	3.25@3.50	Vera Cruz	3.25@3.50
St. Lucia	3.00@3.50	Tampico	3.25@3.50
St. Thomas	3.00@3.25	Rio	**9.60**
Barbados	3.25@3.50	Montevideo, Buenos Aires or La Plata	**9.60**
Kingston	**3.25**	Mediterranean	**9.60**
Curacao	**3.00**	Valparaiso	7.20@8.40
Santiago	**3.25**		

Note—Rates noted in **bold face** type are only approximate.
W. W. Battie & Co.'s Coal Trade Freight Report.

OCEAN CHARTERS

Coal charters have been reported by the "Journal of Commerce" as follows:

Vessel	Nationality	From	To	Tons	Rate
Adriatico	Italian	Baltimore	Genoa	3362	
Storfond	Norwegian	Philadelphia	Havana	2256	
Florence M. Penley		Norfolk	Rio Janeiro	927	$5.35
Hope Sherwood		Norfolk	Bermuda	522	2.50
Malcolm Baxter, Jr.		Norfolk	Boston	1479	1.00
Jacob M. Haskell		Atlantic Range	Guantanamo	1362	
Margaret Thomas		Atlantic Range	Guantanamo	1161	
Wm. E. Burnham		Atlantic Range	Guantanamo	642	
John D. Colwell		Philadelphia	Santa Isabel, P. R.	946	
Ada F. Brown		Norfolk	Rio Janeiro	1294	5.35
D. H. Rivers		Baltimore	San Juan, P.R.	963	
Lucinda Sutton		Philadelphia	Martinique	1331	
St. Gothard	British	Baltimore	W. C. Italy	1790	

Note—Steamers are indicated by **bold face** type, all others being schooners

OHIO VALLEY

PITTSBURGH

Six-year Lake coal contract closed, also one cargo for export. Regular demand slightly improved. Prediction of $1.15 for Lake coal to large shippers. Operations at 55 to 60% of capacity.

A prominent coal and coke interest has just closed a contract with one of the leading Lake shippers for about 200,000 tons of Lake coal annually for a period of six years. The price terms of the contract are not divulged, but it is understood that it is a differential above the prevailing mining rate and that the margin is a close one, in keeping with the rather depressed state of the coal industry.

The first coal export order reported in this district for some time has just been closed, involving one cargo for a foreign port, not specified, of about 6500 tons. This was for a good grade of Youghiogheny gas coal, and quality is understood to have played a large part in determining the destination of the order.

Negotiations have hardly begun yet on coal for the coming Lake shipping season, but there has been some comparing of notes, and in a well posted quarter the prediction is hazarded that the prevailing price will be about $1.15 to the large shippers for ¾-in. Pittsburgh coal. This is 20c. below the prevailing price two years ago. One year ago there was nothing like a standard price, the inquiries being far below normal and developing sharp competition in every instance.

The weather has been only moderately favorable to the development of a good retail demand in the past week, but manufacturing demand has undergone a further increase, and most of the steel mills are now working at a decidedly better rate than a month ago, consuming from 25 to 50% more coal now than in December. Railroad demand has looked up a trifle. Mining operations in the Pittsburgh district have responded to the slightly better total demand, and the mines are working at between 55 and 60% of capacity, on an average.

Prices are a trifle steadier than a week or two ago, and remain quotable about as follows: Slack, 90c.@$1; nut and slack, $1.05; nut, $1.10; mine-run, $1.15; ¾-in., $1.25; 1¼-in., $1.35, per net ton at mine, Pittsburgh district.

TOLEDO

Cold weather gives added impetus to Toledo coal trade. Prices remain unchanged.

Severe cold weather has had the effect of putting some life into the domestic situation and if it continues there will be plenty of business to keep all the local dealers busy. The steam market is not showing any great activity as many of the Toledo manufacturing plants are running light. Prices have not changed so far as the list is concerned but are not very closely held and are largely regulated by how bad the seller desires to let go and how urgent the demand of the buyer. Railroads have not found any difficulty thus far in moving supplies promptly.

COLUMBUS

Colder weather has stimulated the domestic trade slightly. Dealers are buying for immediate delivery and cancellations are less frequent. Steam trade is still dull.

The continued cold weather had resulted in a better tone to the domestic trade; buying on the part of dealers is better and orders are generally larger as their stocks are light and they must come into the market now in order to be prepared to take care of their retail business.

Retail trade has been fairly steady in both the cities and rural districts. Consumers have been compelled to replenish their supplies since the winter has been rather rigorous. Orders are usually small except in the case of public institutions and office buildings. Retail prices are ruling firm at the same level. There is still a preference being shown for Pocahontas and West Virginia varieties but Hocking lump is moving well.

Steam business continues dull and there are no immediate signs of improvement. Much attention is being given to the renewing of contracts, a large number of which expire about Apr. 1. A considerable amount of the steam tonnage at present is being purchased in the open market. One of the best features is the better demand for railroad fuel. Surpluses which railroads had collected are being gradually depleted.

Production has not been increased to any extent during the past week. The Hocking Valley is producing about 60% of normal and the same figures are reported from Cambridge, Crooksville, Jackson and other small districts. In the Pomeroy Bend district the output is about 80% of the average.

Prices in the Ohio fields are:

	Hocking Valley	Pomeroy	Kanawha
Rescreened lump	$1.50	$1.60	.....
Inch and a quarter	1.45	1.50	$1.45
Three-quarter inch	1.35	1.40	1.35
Nut	1.15	1.25	1.15
Mine-run	1.10	1.15	1.10
Nut, pea and slack	0.70	0.75	0.65
Coarse slack	0.60	0.65	0.55

CINCINNATI

The cold weather has stimulated all departments of the trade. Orders plentiful, though averaging small. Outlook much improved, and prices stiffening up.

Both domestic and steam consumers have been forced into the market in greater numbers than has been the case for some time. Almost continuous snow last week, with fairly low temperatures, has compelled the liberal use of fuel, and those who hoped to get through to spring without buying in any quantity are being forced into the market again. Industrial conditions also seem better.

Complaint is heard from some quarters that the volume of business is still much below what it ought to be, but the trade may shortly expect normal conditions, if the favorable weather continues. Judicious curtailment of production has been necessary this season and a more general observance of this will help the present situation.

CLEVELAND

Weather more favorable to the coal business, but the supply has been fully equal to the demand. No change in prices. Floods cause some uneasiness.

The weather has been cold and had a bracing effect on the local market. The retail trade was brisk and did more business than for several weeks. Last Sunday a rain storm, that lasted over Monday, began and by night the rivers and streams were almost at flood stage. Monday some of the railroads called upon local consignees to give orders for quick placing of cars because of the danger of a flood. Toward night the ice jam that was causing the trouble gave way without damage.

Receipts over Sunday were not very large, but the continued presence of consignment fuel held the market for coarse coals down. Fine coal sold at $1.65 to $1.70, and jobbers were not called upon to help move a surplus.

Reports from the Upper Lake docks indicate there will be very little early Lake coal to go forward. Duluth-Superior has close to 7,000,000 tons of coal on dock and agents there estimate the docks will carry close to 4,000,000 tons at the opening of navigation.

The market is now quotable as follows:

	Pocahontas	Youghiogheny	Bergholz	Fairmont	W. Va. No. 8
Lump	$3.60	......	......	......	......
Lump, 6 in.	......	......	$2.35	......	......
Lump, 1½ in.	......	......	2.20	$1.95	......
Lump, 1¼ in.	......	$2.35	......	......	......
Lump, ¾ in.	......	2.25	2.10	1.90	$2.05
Egg	3.60	......	......	......	......
Egg, 6 in.	......	......	2.00	......	......
Mine run	2.60	2.15	1.90	1.85	1.95
Slack	......	1.80	1.75	1.70	1.75

COKE

CONNELLSVILLE

No more coke company failures expected. Coke quiet, but not on account of Thompson failure. Production and shipments somewhat increased.

Present prospects are that there will be no more receiverships for coke companies growing out of the Thompson failure. The only coke receivership thus far is that of Tower Hill, already reported. The failure has not noticeably affected the coke market and is hardly likely to do so. While Mr. Thompson seems to have made no progress in straightening out his affairs, it looks as if there would be fewer changes in ownership than expected, because a number of the recent transactions regarded as loans turn out, with the present alignment of things, to have been sales, so that a considerable part of what has been regarded as Thompson coal acreage is really now in the possession of strong bankers. The steel industry has improved very materially, the Carnegie Steel Co., for instance, operating 32 blast furnaces against 22 three weeks ago, but among the merchant furnaces, the chief buyers of merchant coke, there is no increase in operations. Prompt furnace coke is $1.55 to $1.60 for standard grades, with some brands offered at less, and a good brand could be bought for delivery to Apr. 1 at $1.60. Foundry coke for prompt shipment is offered down to $2, with a strict guarantee of analysis, but some well known brands are still held at $2.40 or $2.50. Contract foundry coke is hardly quotable, but ranges somewhere inside these limits.

The "Courier" reports production in the Connellsville and lower Connellsville region in the week ended Jan. 23 at 214,210 tons, an increase of 7360 tons, and shipments at 212,017 tons, an increase of 7619 tons.

Buffalo—The demand for all grades of coke is light and there is no apparent prospect of improvement at present. There is prediction of something better soon, but that can hardly happen till there is new life to the iron trade. With foodstuffs very active and cotton doing well, it is generally believed that manufactures are are soon to follow. Quotations remain at what is regarded bottom figures, $4.25 for best 72-hr. Connellsville foundry and $3.30 for stock coke.

Toronto, Can.—Coke dealers have been reminded of the existence of a city bylaw to the effect that coke must be sold by measure and not by weight, which has hitherto been regarded as a dead letter. One dealer was prosecuted under this law, but released with a caution, and future offenders are to be heavily fined.

Chicago—Domestic sizes have not been in sufficient quantities to meet the demand, and prices are strong. Furnace and foundry trade shows very little activity, and there is more of this coke on hand than the market will absorb.

Prices are as follows: Byproduct, $4.60@4.95; Connellsville, $4.60@4.80; Wise County 72-hr. (select), $4.60@4.75; gas coke, $4@4.25.

THE STEEL INDUSTRY

January operations show a moderate, but encouraging, increase. The feeling generally better. Railroad buying steadily improving.

Since the steel companies were responsible for practically all of it, the January increase in pig-iron production gives a measure of the gain in steel works output. Our statistics show a total make of 1,601,421 tons of pig iron last month, against 1,515,752 tons in December, a gain of 85,669 tons or 2763 tons a day. The steel works furnaces made 1,115,944 tons in January, against 1,034,802 tons in December, a gain of 81,000 tons or about 8%.

The total number of furnaces in blast Feb. 1 was 160, against 146 on Jan. 1, the Steel Corporation contributing 10 to the increase and the independent steel companies 4. The capacity of all furnaces in blast Feb. 1 was 56,270 tons a day against 48,848 tons a day one month previous. The Steel Corporation is to put three additional furnaces in blast this week—one Lorain and two Shoenberger.

Operations in the Steel Corporation's plants are now on the basis of nearly 55% of ingot capacity. Its statement of unfilled orders as of Jan. 31 is expected to show an increase of 150,000 to 200,000 tons.

The feeling in the steel trade this week is better, and the larger companies look for a further moderate increase in output in the next six weeks.

The increased ability of the railroads to get money and its further accumulation are factors in the situation of which more is heard. Rail buying is still far from normal, but each week adds to the total.—"The Iron Age."

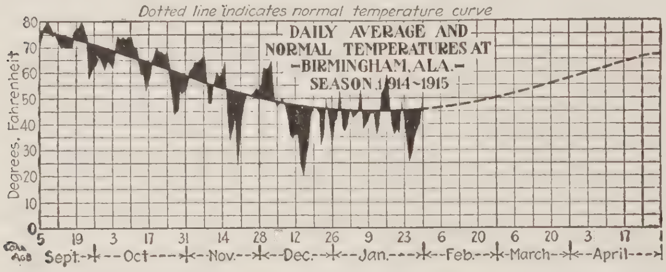
SOUTHERN

LOUISVILLE

Colder weather stimulates the market slightly but the trade is still weak.

Cold weather has resulted in a mild sort of stimulation for the domestic coal market though there has not yet been any improvement in prices or demand due to the fact that the stocks in retailers' hands are heavy. The steam coal market has shown a steady improvement with the betterment of general industrial conditions and there is said to be no steam coal on demurrage in the central part of the country.

Prices continue about as heretofore with block coal ranging up to $1.75 for the best Eastern grades, egg sizes around $1.15 to $1.25 and nut and slack 60 to 70c. for the best grades and 30 to 50c. for the lower grades, all f.o.b. mines.



MIDDLE WESTERN

INDIANAPOLIS

Continued cold weather fails to help the market because of the heavy buying in January. Falling off in orders. Domestic grades moving well. Prices generally unchanged.

The operating end of the Indiana coal industry is suffering a reaction. Consumers stocked up some time ago with the result that their recent buying has been small. The mines are on shorter schedule again, the smaller ones not making much better than three days a week and the larger ones a day more. All the mines made good time during January and most of them from about the middle of December when the real winter weather began. The railroads were then large buyers and many of the principal factories but the stocks accumulated then have not yet been entirely exhausted.

The retail department is the one bright spot, but even in this the dealers have observed an appreciable reduction in the volume of business, apparently due to a rigid economy in fuel bills among the poorer people as a result of the restricted industrial conditions. Prices at the mines are unchanged, though retail prices have been advanced three times from the summer level. Screenings are slightly easier at 75 cents.

CHICAGO

Weather conditions more favorable. Recovery in prices noted in spots. Screenings steady. Better anthracite demand.

Lower temperatures at the close of the week have made a slightly stronger undertone. The sluggishness of last week has been less pronounced, although the cold weather has not yet had much effect on the accumulation of large stocks.

Franklin and Williamson County screenings have been quoted as low as 60c., and there is a wide range of quotations prevalent on the coarser sizes. Harrisburg coals show more firmness than any other Illinois grades. The suspension of certain cement plants in the Northwest has resulted in a considerable quantity of southern Illinois screenings being thrown on the market and consequently prices have weakened.

Springfield screenings have been bettered somewhat, and the demand for domestic sizes has improved.

A wide variation of prices obtains for eastern Kentucky coals, and there is hardly a quotable price on any size.

Hocking grades have been very slow, but nevertheless shippers have held firmly to circular prices on mine shipments. Track shipments have been sold from 10c. to 15c. below list prices.

The anthracite demand which has been slowing up improved during the latter part of the week. A few cars have been accruing demurrage awaiting disposition. The supply of all sizes is ample, but prices are well maintained considering conditions.

Competition in the smokeless coal market has been keen, and while mine-run is holding steady under adverse conditions, lump and egg prices are variable. There seems to be plenty of lump but not much egg on hand and the demand for the latter is brisk.

Prevailing prices are as follows:

	Franklin Co.	Springfield	Sullivan	Clinton	Carterville
Lump......	$1.50@1.75	$1.50	$1.40@1.75	$1.40@1.60	$1.50@1.75

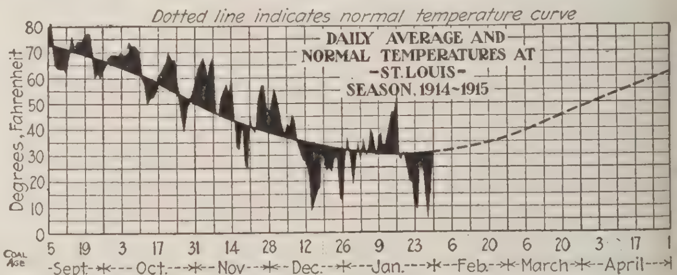
ST. LOUIS

Plentiful stocks available and cold weather has failed to relieve the pressure, though better grade coals are firmer in some cases. Retail demand active but orders are small.

Though the mercury has been hovering around the zero mark, there is a striking contrast with what the market ought to be and what it really is. During the past few weeks all of the retail yards stocked up well on coal so that they were well prepared for the cold snap. As a result, there is extremely cold weather here with practically no demand for coal, and the situation is in such shape that the dealers can dictate the price at which they will buy. Continued cold weather, however, may change this situation in the next day or two, and prices will likely advance.



Some exceptionally good coals from the Williamson and Franklin County fields are selling as low as $1.25 and $1.30, while some of the other fuels from the same field are as high as $1.60 to $1.70. The operators with the higher priced coals, however, are pretty well sold up and are in a position where they can ask a fancy price, knowing that they will have but very little coal to offer on the market. The same conditions apply to the steam sizes, with the exception of washed No. 1, which is in good demand and likely to continue so. There is very little activity in the steam market, and nothing at this time to indicate that it will get any better.

In the Standard field conditions are such that few operators are realizing more than the cost of production on their coal though more cold weather will affect the Standard lump market shortly. The steam sizes are weak with every indication that they will continue so.

The local retail demand is fairly good, but retailers report that there are no large orders. The anthracite demand is light, and the same applies to smokeless. The prevailing market is:

	Williamson and Franklin Co.	Big Muddy	Mt. Olive	Standard	Sparta
2-in. lump........	....	$2.00	$1.25	....	....
3-in. lump........	....	....	1.40	....	....

Coal Contracts Pending

Contracts listed in this department are authoritative in every respect except where the source of information is questionable, in which event it is noted. All contracts are listed promptly on receipt and only repeated when additional information becomes available or in the last issue previous to the day on which bids will be closed. Liberal remuneration will be paid for all legitimate notices of this kind sent in.

Contract No. 62—New York, N. Y.—The bids on this contract (p. 189), which provides for furnishing and delivering coal, were as follows:

SCHEDULE NO. 1, for 650 gross tons bituminous coal to the Far Rockaway disposal plant, Borough of Queens: George D. Harris & Co., $2788.50; John B. Reimer, $2925; William A. Duncan, $3048.50; A. J. & J. J. McCollum, $3217.50.

SCHEDULE NO. 2, for 280 gross tons pea coal to the Newton disposal plant, Borough of Queens: Burns Bros., $1624; John B. Reimer, $1484; J. E. Backus & Sons, $1316; Elmhurst Coal Co., $1330; Jurgen-Rathjen Co., $1307.60; A. J. & J. J. McCollum, $1489.60; Charles Hirschburger, $1372.

SCHEDULE NO. 3, for 1040 gross tons anthracite coal to the County and Borough Buildings in the Borough of Queens:

Amount	Burns Bros.	John B. Reimer	Jurgen-Rathjen Co.	A. J. & J. J. McCollum
600 tons broken[1].....	$5.99	....	$5.93	$5.89
200 tons stove[1].......	6.57	....	6.68	6.37
100 tons stove[2].......	7.10	....	6.93	7.00
140 tons stove[3].......	7.60	7.15	6.93	7.25
Totals	$6682	$1001	$6557.20	$6523

[1]Delivery at Long Island City. [2]Delivery at Flushing. [3]Delivery at Jamaica.

SCHEDULE NO. 4, for (1) 100 tons semibituminous to the Crematories of the Bureau of Street Cleaning at Far Rockaway: George D. Harris & Co., $4.29; John B. Reimer, $4.40; William A. Duncan, $4.75; (2) for 180 tons semibituminous to the Far Rockaway Aqueduct: George D. Harris & Co., $4.24; John B. Reimer, $4.50; William A. Duncan, $4.75. Total on both sections, George D. Harris & Co., $1192.20; John B. Reimer, $1250; William A. Duncan, $1330. Address Mr. Buckley, Borough Hall, Jackson and Fifth St., Long Island City, New York.

Contract No. 67—Schenectady, N. Y.—The local city government will be in the market for about 4730 tons of anthracite stove and egg coal, about the first of next month. The contract is usually closed at about $6.50 per ton. Address, Board of Contract and Supply, Franklin St., Schenectady, New York.

Contract No. 70—Baltimore, Md.—The Fidelity & Deposit Co. purchases about 2000 tons of standard mine-run soft coal annually which is usually bought a carload at a time. Address, Morris R. Pierson, purchasing agent, Baltimore, Maryland.

Contract No. 71—Monroe, Mich.—The Municipal Electric Light Plant at this place, will be in the market for 2600 tons of Smithers Creek coal some time during March. Deliveries are to extend over the next year, and the customary contracting price is $2.60 per ton. Address, Charles R. Osgood, superintendent, Municipal Electric Light Plant Co., Monroe, Michigan.

Contract No. 72—Baltimore, Md.—The H. McCormick & Co. contracts for about 100 tons of soft coal per month. The supply is usually ordered in carload lots when required. Address, H. P. McCormick, McCormick Block, Baltimore, Maryland.

Contract No. 73—Washington, D. C.—Sealed proposals will be received until 11 a.m., Feb. 15, for furnishing and delivering bituminous coal, either at Washington, D. C., or at Alexandria, Va., for the steamer on duty at Fort Washington, Md. Address, J. B. Houston, Depot Quartermaster, Washington, D. C.

Contract No. 74—Bellefontaine, Ohio—The lowest bid received for furnishing a six-months' supply of coal for the local water works was from the W. H. Warner Co., at $1.75 per ton f.o.b. Bellefontaine. The Sunday Creek Coal Co. at present, has the contract, and offer to renew the same of $1.85 per ton. Address Director of Public Service, Bellefontaine, Ohio.

Contract No. 75—Ottawa—The Canadian Department of Public Works calls for tenders addressed to R. C. Desrochers, Secretary, to be received up to March 1st for supply of best quality steam coal to be delivered in quantities, and at places specified. Address, R. C. Desrochers, Secy., Department of Public Works, Ottawa, Canada.

Contract No. 76—Baltimore, Md.—The Emmerson Hotel Co. purchases about 300 tons of standard mine-run coal per month in the spot market. At present there is no existing contract, and bids for furnishing these requirements on a contract might be considered. Address, Wm. H. Parker, purchasing agent, Emerson Hotel Co., Calvert and Baltimore Sts., Baltimore, Maryland.

Contract No. 77—Rochester, Ind.—The Rochester Electric Light, Heat & Power Co. at this point will be in the market for 7000 tons of Indiana mine-run coal on Mar. 1. The contract is to run over one year and it is usually closed at $2.10 per ton. Address, Rochester Electric Light, Heat & Power Co., Rochester, Indiana.

Contract No. 78—Detroit, Minn.—The Municipal Electric Light Plant will be in the market for 1800 tons of Youghiogheny dock-run coal on Mar. 1. This coal laid down at Detroit usually costs $5 per ton and deliveries are to be made over the next year. Address, E. J. Bestick, City Clerk, Detroit, Michigan.

Contract No. 79—Boston, Mass.—The following are the bids received by the United States Navy, for furnishing 5000 tons of navy steaming coal, to be delivered at the Navy Yard, Boston:

5000 TONS—Edward M. Alden Co., New River Georges Creek coal, $3.73, Ralphton Quemahoning, $3.65; Davrow-Mann Co., New River coal, $3.57; Archibald McNeil & Sons Co., Navy New River coal, $3.68; Pocahontas Fuel Co., Pocahontas coal, $3.80; White Oak Coal Co., New River coal, $3.60.

6000 TONS—Bader Coal Co., Pocahontas mine-run, $3.45; Davrow-Mann Co., New River coal, $3.57; J. H. Weaver & Co., Colver coal, $3.40.

3305 TONS—Chesapeake & Ohio Coal Co., half navy standard, one-half trade, $3.62.

5500 TONS—Northern Coal Co., New River coal, $3.55; (bid modified by telegram, $3.60).

5600 TONS—Maryland Coal & Coke Co., standard New River coal, $3.45.

Address, Samuel McGowan, paymaster-general of the Navy, Washington, D. C.

Contract No. 80—Bismarck, N. D.—Bids will be received by the Board of Public Works until 8 p.m., Feb. 8, for supplying about 300 tons of best lump lignite coal to the public schools during the ensuing year. The coal will be subject to state analysis. For further information address R. Penwarden, Clk. of the board, Bismarck, North Dakota.

Contract No. 81—Philadelphia, Penn.—Sealed proposals will be received until noon, Feb. 17, for furnishing and delivering about 29,000 tons of bituminous coal to the floating plant employed in the Philadelphia Engineer District of the United States Government during the period beginning Mar. 1, 1915, and ending June 30, 1916. Address, Col. Geo. A. Zinn, 815 Witherspoon Building, Philadelphia, Pennsylvania.

Contract No. 82—Winnipeg, Man., Can.—Tenders will be received by the Commissioners of the District up to noon, Feb. 22, for furnishing the supply of steam coal required during the year 1915 The quantity is estimated at from 6000 to 12,000 tons. Address S. H. Reynolds, Chairman of Commissioners, 901 Boyd Building, Winnipeg.

Contract No. 83—Baltimore, Md.—The Chamber of Commerce Building purchases an annual supply of from 475 to 500 tons of superior grades Georges Creek coal. The contract calls for the delivery of about one car per month during the summer season, and one and one-half cars during the winter. Address, John T. Davies, purchasing agent, room 214, Chamber of Commerce Bldg., Baltimore, Maryland, for further information.

CONTRACTS LET

Contract No. 8—Portland, Ore.—Bids on this contract (Vol. 6, p. 814) which provide for furnishing 5000 tons of coal, for use on the Dalles-Celilo Canal, were as follows, all prices f.o.b. mine: Roslyn Fuel Co. (13,650 B.t.u.) $2.70; Gunn-Quealy Coal Co. (13,000 B.t.u.) $1.62; Wyoming Coal Co. (13,500 B.t.u.) 87½c.; Wellington, Coma Agency (12,050 B.t.u.) $3.50; Kemmerer Coal Co. (13,900 B.t.u.) $1.79; A. L. Stephens (13,000 B..u.) $3; A. L. Stephens (12,800 B.t.u.) $2.50. The awards were as follows: Roslyn Fuel Co. for 500 tons, and A. L. Stephens for 1500 tons. Owing to the more rapid completion of the canal than anticipated the requirements do not exceed 2000 tons. Address Major Jay J. Morrow, Corps of Engineers, U. S. A., U. S. Engineer Office, 802 Couch Bldg., Portland, Oregon.

Contract No. 61—Erie, Penn.—This contract (p. 189), which provides for furnishing the best Pittsburgh ¾-in. lump coal to the local garbage disposal plant, has been let to the Burnwell Coal Co., at $2.30 f.o.b. the Garbage Plant Siding, Belle Valley, Penn. Address, Frank E. Pellow, Supt. of Parks and Public Property, Erie, Pennsylvania.

Contract No. 63—Lorain, Ohio—This contract (p. 189), which provides for furnishing 3500 tons of coal for the water department, has been awarded to the West Virginia & Ohio Coal & Coke Co., Cleveland, Ohio, at $1.87 per ton f.o.b. Lorain for Goshen mine run and $1.55 for slack coal. Address, L. B. Johnston, Clerk, Board of Public Service, Lorain, Ohio.

Contract No. 66—Guantanamo Bay, Cuba—The bids on this contract (p. 231), which provide for furnishing and delivering, or either, or both, 5000 tons of coal to the United States Government at Guantanamo Bay, Cuba, were: Wm. C. Atwater & Co. (Pocahontas coal), $6.80; Berwind-White Coal Mining Co., 4600 tons at $5.90, and 1100 tons at $5.25; Caster-Curren & Bullitt (Pocahontas coal), $6.80; H. N. Hartwell & Sons (smokeless fuel), $6.74; Maryland Coal & Coke Co., 2300 tons at $5.80; Smokeless Fuel Co., $6.84; Willard Bros., 684 tons at $6; Pocahontas Fuel Co., 5000 tons at $6.95, and the same (by sailing vessel), $5.60. The awards were: W. A. Blake & Co., transportation on 1000 tons, $2500; Crowell & Thurlow, transportation on 1900 tons at $5700; Berwind-White Coal Mining Co., for furnishing and transporting 1100 tons at $5775.

CONTRACT NOTES

The United States Naval Department have asked for bids for the transportation of one to six cargoes of coal amounting to 5000 to 8000 tons each, from Atlantic Coast points to San Diego, Calif. and, or to, Tiburon, Calif. The carriers must be ready to load at any time upon demand between Feb. 20 and Apr. 20.

The United States Naval Department has asked for bids for the transportation of one cargo of coal of 5000 to 8000 tons from the Atlantic Seaboard to San Diego, Calif., or to Tiburon, Calif. Loading is to be made at any time on request between Feb. 15 and Mar. 15.

PRODUCTION AND TRANSPORTATION STATISTICS

SOUTHWESTERN TONNAGE

The following is a comparative statement of the Southwestern tonnage for September and the preceding two months of the years 1913 and 1914:

[1] Includes coal received from connecting lines.

[2] Includes company's coal.

[3] Does not include company's coal hauled free.

Note:—The Southern Railway hauled 359,229 short tons of bituminous coal during October, 1914, and 3,324,703 short tons during the ten months ending Oct. 31, 1914.

FOREIGN MARKETS

GREAT BRITAIN

Severe shortage developing because of the scarcity of men. High ocean freights have caused a slowing up in exports.

Jan. 22—Firmer conditions are in evidence as a result of an improved demand. The tonnage position is much better and sellers are looking forward to an active trade for some time. Quotations are approximately as follows:

Best Welsh steam.......	$5.04	Best Monmouthshires....	$4.26@4.32
Best seconds...........	4.56@4.68	Seconds................	4.20@4.32
Seconds................	4.32@4.44	Best Cardiff smalls.....	3.24@3.36
Best dry coals..........	4.44@4.56	Cargo smalls...........	2.52@2.82

The prices for Cardiff coals are f.o.b. Cardiff, Penarth or Barry, while those for Monmouthshire descriptions are f.o.b. Newport, both net, exclusive of wharfage.

Freights—The demand for tonnage is not so great and chartering is slow. Tonnage, however, is still scarce. Rates are approximately as follows:

Gibraltar.........	$5.40	Naples..........	$6.96	Las Palmas......	$6.00

"Do You Know Why Every User of the Barsteel Is a Booster?"

"It's because **Barsteel** locomotive features meet every coal mining demand.

"The **Barsteel** construction concentrates strength at points where there is greatest stress. Consequently, a frame **never has been broken on any locomotive in service.**

"The service record of the commutating-pole motors cannot be equalled. From a standpoint of maintenance they show better than all others.

"The large bronze motor bearings with oil and waste lubrication give better and longer service than any other kind. There are many cases where bearings have been in continuous service for three years.

"These, and the diagonally split motor frame, split gear case, open locomotive frame, and Vauclain removable gib make the Baldwin-Westinghouse **Barsteel** pre-eminent as the locomotive designed for mining work. Everything is simple, strong and easy to get at."

RUN-OF-MINE TALKS

ON YOUR BUSINESS AND OURS

By the Business Manager

HERE'S a cordial invitation for you! I don't want these "Run-of-Mine Talks" to be all one man's ideas and opinions.

There's a whole lot to be said on the subject of advertising as applied to coal mining and some of you men at the mines who read the ads must have ideas on them that are worth expressing.

So here's an open invitation to you to send in any ideas or opinions you have on the ads in Coal Age, ads of articles that you think *ought* to be there, and so on.

Let's have some discussion on coal mine advertising—we can get a lot out of it in the exchange of thoughts.

This page is open to all of you—use it!

PERHAPS one of the best ways to get a line on the dependability of what you read in the advertising pages, is to find out the motives and principles on which the men who advertise are working.

For instance, here's a paragraph from a paper by L. L. King, Advertising Manager of the Goodyear Tire & Rubber Co., Akron, O:—

> "The most successful and the only honest way to deal with the public is *to play the game out in the open.* If there are true and interesting reasons why the public should buy something from a certain manufacturer, then this manufacturer should be glad of the chance to say so over and over again, through the medium of reliable advertising mediums."

□ □ □

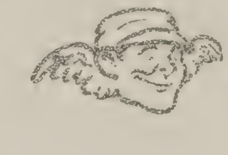
NOTE the line in italics, for that's the keynote of modern advertising—

And, "to play the game out in the open" is a pretty good hunch for all of us to follow.

COAL AGE

Vol. 7 NEW YORK, FEBRUARY 13, 1915 No. 7

The Driver *vs.* The Leader



By I. C. Parfitt

A Common Occurrence

A MOTOR with a large trip of loads is coming down a heavy grade. From defectiveness of brakes or other car mechanism, track deficiency or carelessness, a wreck occurs; timbers are knocked out; roof has fallen and the trolley wire is down.

General consternation reigns. The foreman appears upon the scene. "What in ——— is the matter *now?*"

Without taking time to look the situation over and formulate plans, he continues: "Now, you ——— get to work."

There's a noise like every one trying to do the same thing at the same time and doing it wrong.

"What are you doing there, you ———! Get out of the way! You don't know enough to slop a hog."

"Why in ——— don't you get busy there! Some of you good-for-nothing idiots, get hold of this car."

More noise as per above. Agitation increasing. Consternation beginning. Confusion reigning. Profanity and epithets (raining) likewise. Foreman busy everywhere, with his jaw.

Men busy everywhere doing little or nothing. Wasting energy. Becoming more excited and ineffectual, trying to obey contradictory orders. Excitement converging into lethargy. Personal abuse of the "wrong" man by foreman. Retaliation in kind. Man discharged.

Wreck finally cleared by bullheaded strength and awkwardness. Foreman retires from scene triumphant. *He* has done it all. Depression of spirits and prevalence of hard feelings among the men. Work automatic. Interest lacking. Loss of time twice or three times that required, but the foreman has demonstrated that he is—The Boss.

Another Wreck

A SIMILAR wreck occurs at another mine. The foreman arrives upon the scene. He takes a few moments to make a general survey of the conditions and size up the situation. Having formulated his plans, his orders and instructions are issued distinctly, intelligently and gentlemanly.

Encouraged and stimulated by his bearing, the orders are obeyed with promptness, intelligence and unanimity The work, under concentrated effort, progresses rapidly. In a short time the roadway is cleared, repaired and ready for operation.

The foreman questions the motorman and spragger as to the cause of the accident. His men, feeling assured that truthfulness is the best policy, soon place him in possession of the facts in the case. A mistake is considered, reprimanded and perhaps condoned. A willful or malicious act is visited with justice.

The mine work goes on with increased energy, interest and care.

Confidence is established and respect gained.

Query:—Which foreman is the efficient executive?

Driving Rock Tunnels at a Utah Coal Mine

By A. C. Watts*

SYNOPSIS—Most data on the driving of rock tunnels refer to work accomplished by individuals or firms specializing in this line. The work here described was done by an organization created for that purpose and recruited from the regular mine force. No specific attempts were made to break records.

As a general rule the only literature on driving rock tunnels is that descriptive of work in metal mines, or for irrigation, water supply and railroads. Such tunnels are usually driven by organizations specializing in this work and much effort is expended toward making records.

In coal-mining operations and the opening of new coal fields it is often necessary to drive rock tunnels but only small mention is made of them.

While, during the driving of the tunnels described herein, no special efforts were made to break any records the results attained were so good as to merit description.

The tunnels under discussion were necessary to open a new development adjacent to the Utah Fuel Co.'s Clear Creek mine No. 1, and were driven as haulage and air-course entries.

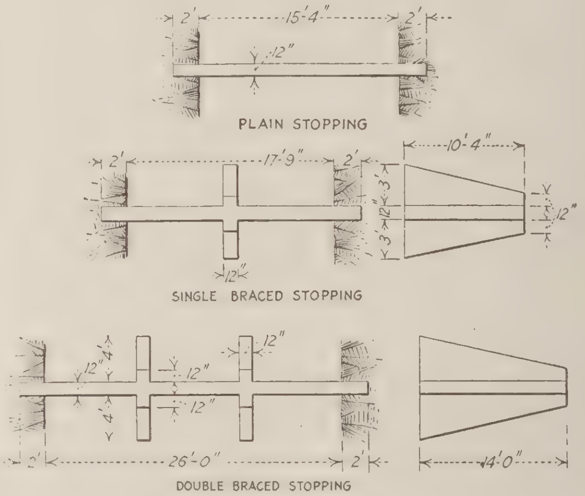
In order to systematize and expedite the work as much as possible a separate organization was created—made up of expert "hard-rock" men. Although kept distinct from the regular operating organization it was necessary to coördinate their work with that of the mine in order not to interfere with the production of coal.

Owing to the location of the tunnels it was possible to utilize the main haulage entry of the No. 1 Mine for the hauling out of waste rock and the taking in of supplies, while the power plant of the mine furnished power for compressors and electric haulage.

To determine the proper location and grade of these tunnels diamond-drill and surfacing prospecting was resorted to. The results developed the fact that the coal to be attacked lay just high enough above the old workings to prohibit locomotive haulage but not sufficiently high to give a properly balanced inclined plane. It was therefore decided to run on a ½ per cent. grade for the first half of the distance so as to permit locomotive haulage from the main entry of No. 1 Mine, and the last half on a 7½ per cent. grade to be operated with a double-drum hoist. The last half was laid with three rails from the upper parting in the coal to the lower parting in the rock with a double-track pass-by 300 ft. long, half way between the partings. The upper parting will have a grade just sufficient to permit loaded trips starting by gravity. The hoist for this plane will be equipped with motors sufficiently powerful to handle a loaded trip on the 7½ per cent. grade, to provide for derailments making it necessary to pull loaded trips back onto the track.

The starting points of the tunnels were laid out opposite the main haulage entry of No. 1 Mine about 2900 ft. from the mine portal so that the new territory would be entered about at its center. Approximately 600 ft. of entry was driven through the coal from the main haulage road of No. 1 Mine to reach the commencement of the main rock tunnel while the air-course tunnel was started from an old room which had been stopped against a fault. The lead from the main haulage road is a 200-ft. radius curve.

The main haulage rock tunnel was driven with a rectangular cross-section having a minimum height of 8 ft. and a minimum width of 10 ft., while the air course, of a similar cross-section, had minimum dimensions of 8 ft. in height and 12 ft. in width. Overbreakage and trimming have increased these dimensions on an average of one foot each way. Two tunnels were driven in order to provide for adequate ventilation of the new mine as it was impracticable to sink a shaft or drive an adit from the outside for air.



DETAIL OF COST PER CU. YARD

6 Stoppings and 1 overcast. Total 119.0 Cubic Yards
All hand work. Labor $3.15 per 8 Hrs. Carpenter's $3.40 per 8 Hrs.

ITEM	LABOR	MATERIAL	TOTAL
Reinforcing Material (Scrap Iron)	$0.278		$0.278
Gathering & Distributing Gravel in Mine	2.683		2.683
Cement	0.076	$2.659	2.735
Forms	1.936	0.554	2.490
Redistribute Gravel, Mix & place Concrete	3.835 *		3.835
Totals	$8.808	$3.213	$12.021

Gravel hauled in winter. Difficult to redistribute gravel and place concrete on account of old workings

* INCLUDES COST OF MAKING OLD WORKINGS SAFE

Plan and Cost of Reinforced-Concrete Stoppings

The minimum width of 10 ft. in the haulageway allows ample width for locomotive haulage but the incline end of the tunnel was driven 12 ft. wide to allow for the three-rail balanced inclined plane. The widening operations were accomplished after the tunnels had been driven through to the coal.

Sandstones and Shales Were Penetrated

The rock strata penetrated were sandstones and shales of medium hardness. The shales were the hardest to drill as the gumming of the cuttings made it difficult to keep the holes clean. The first halves of the tunnels, driven on a ½ per cent. grade, were parallel with the bedding planes of the strata and thus much harder to break. The last halves, driven on a 7½ per cent. grade, took the tunnels off the bedding planes somewhat but increased difficulties were encountered in the numerous small faults which were cut through as a main faulting plane was approached.

---

*Utah Fuel Co., Castle Gate, Utah.

Generally, when these faults were struck, caving took place sometimes to twice the height of the tunnels, thus necessitating the moving of large amounts of muck. Temporary timbering was necessary at many of these places. At one point an air vent to the surface was encountered although the cover was probably from 400 to 600 ft. thick.

DETAILS OF DRILLING IN TUNNEL FACE AND PLAN AND ELEVATION OF OVERCAST

At another place a flow of black damp was struck which drove the men out of the tunnels.

The breasts of the tunnels often presented alternating bands of sandstones and shales, or of thin seams of coal and bands of sandstones and shales which required constant study in the arrangement and drilling of the shot holes, and on account of the spongy, springy nature of the ground, together with the numerous fissures and splits some holes in the rounds would miss fire or fail to break the ground. When these missed shots occurred it was customary for the succeeding shift to fire them or redrill and fire other shots. For about two weeks the ground was so bad on account of slips, fissures and faults, which caused the first shots to cut off the later shots, that a man was left on duty to fire all missed holes before the succeeding shift came in.

On the average the ground was fair drilling but in some places it was necessary to use water under pressure to clean out holes so as to render it possible to drill them at all. In such cases the water, at 100 lb. pressure, was forced into the holes through ⅛-in. pipe 16 in. long used as a nozzle. The time necessary to drill the rounds varied from one hour and 45 min. to the full 8-hr. shift. The outside back holes were drilled first, then the outside breast holes, then the inside breast holes, and so on as shown in the accompanying sketches, the numbers designating the order of drilling.

THE COMPRESSED-AIR SUPPLY

The source of power was the power plant of the mine, consisting of six 125-hp. 72-in. by 16-ft. horizontal return-tubular boilers hand fired with slack or the poorest grade of run-of-mine coal coming from the mine, and two Thompson-Ryan generators of 175-kw. capacity, 320 amp. 500 volts, driven by 19x18-in. McEwan engines of 260 hp. each at 200 r.p.m. Power was charged against the work at the rate of 1.24c. per kilowatt-hour.

Current from the generators was conducted about 200 ft. to a 24x64-ft. combination compressor and blacksmith shop, 40 longitudinal feet of which was used for the compressors. Two Ingersoll-Rand compressors of the Imperial type No. 10, were used. These compressors had a rating of 427 cu.ft. of free air per minute at 175 r.p.m. at sea level. Each machine was driven through a belt connection from a 500-volt 116-amp. 75-hp. General Electric continuous-current motor operating at 850 r.p.m.

Air was conducted to two receivers in the compressor house, one being 3 ft. in diameter by 8 ft. 3 in. long and the other 3 ft. 6 in. by 8 ft., then into the mine through a 4-in. pipe 3725 ft. long to a 3-ft. 6-in. by 8-ft. receiver, thence 350 ft. through a 3-in. pipe line to the starting points of the tunnels and through 3-in. branch lines to within 50 ft. of the faces, 1-in. air hose being used from thence to the drills.

The compressors were placed outside the mine mainly to insure getting dry air as the atmosphere inside the mine contains a large amount of moisture due to the sprinkling of dust and the natural wet condition of parts of the mine. Furthermore by placing them in the same building as the blacksmith shop it was possible to effect a saving in the attendance cost. During the day shift the running of the compressors was left to the blacksmith and his helper. By having the compressors outside the mine no trouble whatever was experienced by the freezing of the air drills.

Drill steel was sharpened with a Numa rock-drill sharpener. For heavy blacksmith work the smith set up an old Sullivan coal puncher for a hammer. To do this required only the fitting on of a hammer-block 4x6x6 in. in place of the bit of the puncher, setting the machine on a suitable frame and making a foot control. The expense of this makeshift was slight but the saving effected in the cost and quality of the work was noticeable. For forge fires the smith used a combination of coke breeze and slack coal from the Sunnyside mines of the company with good results.

The coal dust was first made thoroughly wet and then compactly built around the tuyere of the forge in a semicircle about 3 ft. in diameter and 12 in. high. Fire was kept up in the center with coke breeze. For one shift the material necessary to heat the drill steel amounted to one No. 7 wheelbarrow full of coal dust and 3 of coke breeze. The Sunnyside coal and coke used in this manner were found to make a splendid blacksmith fire, much better than by using ordinary coal partially coked.

Chicago giant rock drills, size 3¼ in., were used in driving while Ingersoll-Rand Jackhamers and Sullivan DA21 stoping drills were used for trimming and widening. Two drills were used at each face and were mounted as shown in accompanying drawing, one drill on each 4½-in. by 7-ft. double-screw column. In double-shift work, on account of the muck being in the way during the drilling of the first holes, it was necessary to mount the drills upon one 4½-in. by 10-ft. 6-in. single-screw bar with which was used a single-screw brace to the face to take up vibration of the bar. In this way the upper rows of holes were drilled first with the bar set near the roof and by the time these were completed the muck was cleared away from the face and the bar could be set up in a lower position and the remainder of the holes drilled. A 3-in. water main having ¾-in. hose connections was used along the back entry to within 50 ft. of the face. From these connections to the faces ¾-in. pipe was used with ⅛-in. by 16-in. special reducing nozzles.

For mucking plates sheet steel 4 and 5 ft. wide by 10 ft. long with two chains and ring handles at each end were used. These were laid for 20 ft. lengthwise of the entries up to within 4 ft. of the faces.

For rock disposal the ordinary end-dump mine cars built of wood were used. These held about 2.5 cu.yd. of material as loaded, the net weight of rock in the car being about 8100 lb. Cars were hauled by horses to a parting about 3500 ft. from the mouth of the mine. From this parting a 13-ton electric motor took them to the outside where they were dumped over ordinary goose-neck tipples. When the mine was working the motor hauled rock between trips of coal and whenever convenient. Eight to 10 cars made up the trip. Two tipples were used so that one could always be in a new position by the time the dumping space of the other was filled.

For framing timbers and making blocks and wedges a small sawmill was used. It consisted of one 36-in. circular cross-cut saw and one chisel-tooth rip saw, each connected to a 5-hp., 500-volt, direct-current motor. The method of timbering in bad ground is shown in the accompanying drawings.

Ventilation Was Secured by a Split

The main ventilation was accomplished, as in all coal mines, by giving the tunnels a separate split of air from the main ventilating system of the mine and driving crosscuts between them at regular intervals. To secure a separate split from the old mine it was necessary to build 6 concrete stoppings and one overcast. On account of the height of the stoppings they were built of reinforced concrete with reinforcing wings as shown in the accompanying drawing, old rails and wire rope being used for the reinforcing material. The reinforcement of the overcast was made with the same class of material. Ventilation at the faces of the tunnels was adequately accomplished from the drills when running. Before shifts went on any accumulated gases were driven out by opening the air cocks in the pipe lines and blowing.

The powder used was mainly 60 per cent. dynamite with sticks 8 in. long and 1¼ in. in diameter. This came 84 sticks to the case. The caps employed were Hercules 6X, and the fuse Bear Brand and ZL.

Labor, Organization and Rates of Pay

On single shift the machine men worked during the day, that is, from 7:30 a.m. to 4 p.m., and the muckers and drivers during the night shift beginning at 8 p.m. and ending when the muck was cleaned out. The shift for the machine men, muckers and drivers, while nominally 8 hr., was considered finished whenever their work was completed, and more often than otherwise they would get through with their work before the 8 hr. was up. On double-shift work the muckers and drivers went on duty at 8 a.m. for the day and at 6 p.m. for the night shift, while the machine men went on at 9 a.m. and 7 p.m. for the respective shifts.

There were two machine men to each drill or four to each heading. The two machine men per drill alternated as runner and helper day by day. Both received the same wages which were $3.50 per shift of 8 hr. with a bonus of 10 per cent. of the day's wage for each foot over 3 ft. of tunnel driven that they averaged per shift. The bonus was calculated at the end of the month instead of each day, except in cases of men quitting before the end of the month. The average wages earned by this system by the machine men was $4.17 per shift. These men were required to do the drilling, extend both the air and water lines, make up primers, load and shoot holes.

Details of Drill Column with Brace to Tunnel Face and Method of Timbering

Timbermen were paid the same wages as machine men including the bonus. There was comparatively little timbering to be done so that machine men were used for this work and it was thought fair to allow them the same wages as they would have earned if running machines.

There were four muckers to each heading who were paid $3.25 per 8-hr. shift and a bonus of 10 per cent. of the day's wage for each foot over three feet of tunnel driven per shift, just as paid the machine men. By this system the average wage earned by muckers was $3.84

per shift. The muckers laid all track, not including switches, put down the mucking sheets, loaded and unloaded drill steel and kept track clean for 100 ft. from the faces.

Drivers were paid $3.15 per 8-hr. shift without any bonus. They were required to take muck away from the faces to the parting, bring in empties and haul steel, powder, caps, fuse, rails, ties, etc., from parting to faces.

The dumpers outside were paid $3 and $3.15 per 8-hr. shift without any bonus. They were required to handle the rock—the extending of the tipples was done by the regular mine carpenters paid $3.40 and $3.15 per 8-hr. shift.

The blacksmith was paid $4 per 8-hr. shift and straight time for overtime. His duties were the sharpening of drill steel, general repairs and other blacksmith work.

The compressor attendants were paid $3.50 per 8-hr. shift and were required to run the compressors and assist the blacksmith.

The head foreman was paid $175 per month and his assistant $4.50 per 8-hr. shift.

Fortunately the tunnels were driven without any fatal or serious accidents.

UNIT COSTS OF STRAIGHT TUNNEL

Engineering		$0.0503
Superintendence		0.9885
Drilling	Machine men Machine men bonus	3.8221
Handling rock	Muckers Muckers' bonus Dumpers Extending dump	4.0331
Hauling	Drivers Motor men Shafts Stable expense Horse killed Ditch and track Tracks and switches	1.3193
Blacksmithing		0.3844
Power	P.H. charge Running compressor Repairs, compressor Pipe lines Repairs, drills	1.8604
Timbering		0.4389
Blasting material		2.7707
Machinery	Housing Setting Depreciation Miscellaneous	0.6655
Total cost per ft. of tunnels		$16.3332

The work of widening the main haulage tunnel for the pass-by and parting was done after the tunnels were driven to the coal. For this work Ingersoll-Rand Jackhamer drills with ⅞-in. hollow steel were used. The men were paid for straight time at the same rate as for tunnel driving, no bonus being given. The shots were detonated by electricity, using 6X detonators. A total lineal distance of 700 ft. 8 ft. high was widened from 3 to 5 ft., the unit cost for the work being as follows:

COST PER LINEAL FOOT OF WIDENING OPERATIONS

Superintendence		$0.4675
Drilling		0.3656
Handling rock	Muckers Dumpers Extend dump	1.3243
Hauling	Drivers Stable expense Motor men	0.3171
Blacksmithing		0.1712
Power	Compressor men Pipe lines	0.1681
Blasting material		0.5292
Miscellaneous		0.0486
Total cost per lin.ft.		$3.3916

If the cost of the widening operations is added to that of driving the tunnels the total expense per foot would be about $17, but if salvage is allowed on pipe and material left over and subsequently used for coal-mining operations the cost per foot is brought down to $15, which would be the net cost.

The average progress per shift for both single- and double-shift work during the whole time of driving the tunnels was 5.11 ft. The highest average per shift per month was 5.56 ft. The greatest distance driven in a tunnel in a single month was 323 ft. in 60 shifts.

Single-shift work was found to be less efficient than double-shift work, although to a certain extent this was due to the forming of a working organization and to the necessary experimenting with the drilling and shooting of the ground during the earlier stages of the undertaking.

Indiana's Mineral Output 80 Million Dollars

The principal mineral products of Indiana are coal, clay wares, cement, and stone, the aggregate value of these four substances in 1913 exceeding 90 per cent. of the total value of the output of the mines and quarries, according to a statement issued by the U. S. Geological Survey.

In 1913 the total value of the mineral production of Indiana was $46,607,864. To this total the coal mines contributed $19,001,881, the portland cement plants $10,218,867, the clay products $8,498,646, and the stone quarries $4,676,689. In 1912 the mineral output of the state was valued at $42,239,193, compared with which the production in 1913 shows an increase of $4,368,671, or over 10 per cent. These values do not include that of the pig iron produced in the state, which in 1912 exceeded $17,900,000 and in 1913 was over $20,600,000, nor do they include the value of the coke produced, which, in 1913, amounted to nearly $13,200,000. These two items make the sum total over $80,000,000. In the production of coal, which is the principal mineral product of the state, Indiana ranks seventh, with an output in 1913 amounting to 17,165,671 short tons, valued at $19,001,881, compared with 15,285,718 short tons, valued at $17,480,546, in 1912. The coal-producing counties are all in the southwestern part of the state and cover 6500 square miles.

Since the completion of its plant of 560 retort coke ovens at Gary by the United States Steel Corporation, Indiana has assumed importance as a manufacturer of coke and has advanced from the relatively low place of seventeenth in 1910 to third in 1912 and 1913. In addition to the plant at Gary, there are 100 retort ovens at Indianapolis, 50 of which were completed in 1913, 22 at Muncie, and 66 at Indiana Harbor. Another plant of 41 ovens is under construction at Indianapolis. The production of coke in Indiana in 1913 amounted to 2,727,025 short tons, valued at $13,182,136, an increase from 2,616,339 short tons, valued at $12,528,685, in 1912.

A New Compensation Chart

By Leo Gluck*

As compensation laws are being enacted in several states, I have compiled a chart showing the present value of an annuity for the period of life a man might be expected to live if he had already attained a certain age. This period is known as the expectation of life. Let us suppose a man might be expected to furnish his wife $300 a year for the rest of his life to support herself and the children. Let us also assume he has arrived at the age of 30 years. According to the American table of mortality, it will be seen that he may be expected to live till he is 65.33, for a long series of observations show that this is the average duration of life of those reaching 30 years. If he should be killed at that time, to provide the sum of money which at 4 per cent. would pay an annuity of $300, $300 × 18.7453 or $5623.59 would be required.

Table for Calculating the Present Value of the Income Which a Man Might Have Expected to Receive Had His Life Not Been Shortened by Accident

The base line of the figure is divided to show the age to which the man is supposed to have arrived when an accident occurs by which he is killed. This is termed the "age of death." From this base are plotted off ordinates showing how long the man might have been expected to live but for the untimely accident. A curve is drawn connecting these ordinates which shows the relation of expectation of life to the age at which the workman is killed. This is the lower curve on the table. The topmost curve is obtained by extending the ordinates so that they represent the expectancy of life plus the age attained—that is, the age at which the man might have expected to die had not the accident intervened.

There is a third curve between the other two based on a scale of ordinates on the right of the diagram. This curve shows what is the present value of an annuity of $1 a year for the whole period of expectancy—that is, for the length of time the man might have expected to live according to the tables of mortality had not the accident intervened by which he lost his life.

Suppose he is killed at 40 years of age. We look for 40 on the base line and follow up the ordinate from that point to the first curve and learn that he had at that time an expectancy of 28.18 years. Following the ordinate still further to the upper curve, we find that had he not been killed in the accident, he might have anticipated living to the ripe age of 68.18 (that is, 40 + 28.18) years. To provide his heirs with $1 per year for the period of 28.18 years, it is necessary to set aside $16.72719, and this figure will be found on the middle curve at the ordinate just mentioned which is located above the figure 40.

A horizontal line has been drawn from a point on the middle curve immediately at its intersection with the ordinate for 21 years. This line has been extended to the left of the figure and the ordinate length has been figured, appropriately from 0 to 100. The compensational equivalent due to a man's estate if he were killed at 21 years of age would be 20 times the annuity found to be due him. This is figured as 100 per cent. The relative magnitude of other compensations at other ages of death can be found by tracing up the ordinates for such ages as far as the middle curve and tracing the horizontal line to the left over to the scale just described. Thus the compensation for a man who is killed at 60 should be roughly 53 per cent. of that of a man cut off by accident at 21 years of age.

⁂

German Coal Prices

At the last meeting of the committee of the Rhenish Westphalian Coal Syndicate the basis prices for blast-furnace coke and coal were declared unchanged for the first quarter of 1915, but higher prices were fixed for the period from Apr. 1 to Aug. 31, 1915—namely, an average advance of 47c. per ton for coal and briquettes. In the case of coke, however, concessions will be made for the same period averaging 35¼c. per ton. The selling prices will be fixed accordingly.

The advance for coal and briquettes is accounted for by the considerably enhanced working costs caused by the reduction of the production and the higher rates the mines have to pay for the necessary material.

The November statistics give the coal contract deliveries as 4,600,119 tons, against 6,036,509 tons last year. For account of the syndicate, deliveries in coal were 3,309,342 tons, against 4,388,138 tons; in coke, 548,466 tons, against 807,797 tons, and in briquettes 335,807 tons, against 320,705 tons last year. The total coal production for November was 5,753,293 tons, against 6,041,509 tons for October, and 7,801,848 tons for November last year.

Electrically Driven British Longwall Coal Cutters

By S. F. Walker*

SYNOPSIS—Three distinct types of longwall machines are in general use, but the problems incident to driving are in large measure common to all. The method of transmitting alternating current to the machine and the kind of resistance employed in starting are described in detail.

Three types of electrical machines for longwall work are employed in the United Kingdom. These are the disk, the chain, and the bar coal cutters.

The bar coal cutter was the type first introduced, but has only recently established itself as a thoroughly efficient machine. The disk coal cutter was for a long time the favorite, probably mainly because it could be depended upon, provided of course that it was supplied with sufficient power. The bar machine possesses an advantage over the disk type, in that it requires less power for driving. On the other hand, it does not answer well when hard material is encountered.

A short time ago the makers of one of the leading bar machines, in a paper read before one of the institutes, strongly advocated cutting in the coal in place of the clay underlying it. It is believed by some that this course was advocated because of the difficulty experienced with this type of machine in cutting in heavy clay, while, as a rule, no trouble is experienced when cutting in coal.

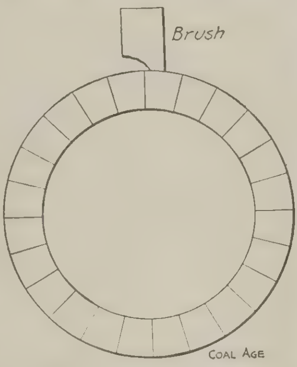

Fig. 1. Brush in Bad Condition

Broadly speaking, bar and disk machines are used for light and heavy work respectively; that is, when it is advantageous for any reason to cut in the underlying clay or in a parting of hard material, the disk machine is the more suitable; on the other hand, where the underlying material is soft, or where it is desirable to cut in the coal, the bar machine is making steady headway.

The chain machine, which is an adaptation of an American device introduced several years ago, stands halfway between the disk and the bar type. It will not perform the heavy work accomplished by the disk machine, but will negotiate difficulties which cannot always be successfully met by a machine of the bar type. It is also claimed for this cutter that it brings out the cuttings in small lumps instead of in dust.

Driving the Machine Is a Difficult Problem

The amount of power required by the various machines has an important bearing upon the question of drive. The successful driving of a coal-cutting machine by an electric motor is one of the most difficult problems the electrical engineer is called upon to solve. The space and weight allowable are necessarily small, and the conditions under which the motor and accessories have to work are such as to render operation extremely difficult.

The power required for driving the different types of coal-cutting machines varies widely. Bar machines sometimes work successfully with 10-hp. motors. Disk machines may require as much as 50 hp. The difference between an electric motor capable of furnishing 20 hp. maximum for a short time and the one which is required to develop 50 hp. for long intervals is considerable. The size and weight of the 50-hp. motor are necessarily much greater than those of the smaller machine.

All three forms of the longwall coal-cutting machine may be driven by either continuous or three-phase alternating-current motors. The distinguishing characteristic of the continuous-current motor is the fact that its armature carries a commutator built up of a number of segments of copper separated from each other by plates of mica. The current is delivered to the coils of the machine through carbon blocks or brushes bearing upon the surface of this commutator. Mining engineers distrust the direct-current motor, for, particularly under the conditions prevailing at the coal face, the commutator wears rapidly, and there is also the danger of sparking at the brushes igniting gas if the latter is present.

When the condition of the machine is perfect, the brushes carefully fitting upon the commutator, the face of the latter being true, sparking is reduced to a minimum, but there is nevertheless the danger that such a spark may ignite an explosive mixture, provided the latter is present in the machine case. Under working conditions both brushes and commutator are liable to wear, which materially increases the tendency to spark.

In such a case as that shown in Fig. 1, where the brush is making but poor contact with the commutator, pernicious sparking is liable to take place. Furthermore, while much has been done to render the case of an electric motor gas tight, this can never be accomplished. What is known as "breathing," which is the alternate inspiration and expulsion of air from the motor case due to varying temperatures of the machine when at work and when idle, allows ingress of a gaseous mixture if gas be present while the machine is cooling off. Instances are on record where explosions have taken place inside of motor cases.

Three-Phase Current Is Favored

For these reasons and due also to the fact that alternating current lends itself conveniently to distribution, mine managers and engineers strongly favor the three-phase current for all purposes about the mine. Motors utilizing this form of energy are made in two forms, what are called the squirrel-cage and the wound-rotor motors.

With the squirrel-cage rotor machine everything tending to cause sparking is eliminated. The rotor, or moving element, resembles a squirrel cage. It is a skeleton barrel of copper staves joined at either end by a copper ring. These staves are, of course, embedded in slots provided therefor in an iron core. A skeleton squirrel cage without the iron core is shown in Fig. 2. The core above mentioned is common to the continuous-current armature and to the rotor of all three-phase alternating-current motors.

---

*Bath, England.

The squirrel-cage rotor possesses many advantages over other types, but, unfortunately, it has one serious drawback. The starting torque is so low that it cannot be made to move a coal-cutting machine from rest when fully loaded. In one form of squirrel-cage rotor, this difficulty is overcome by making the bars of a material having a comparatively high electrical resistance, such as german silver. With a high electrical resistance the motor will develop a considerably larger torque on starting. Thus equipped, however, the machine is comparatively inefficient, necessitating a larger motor for a given machine, also a larger demand for current from the distribution system.

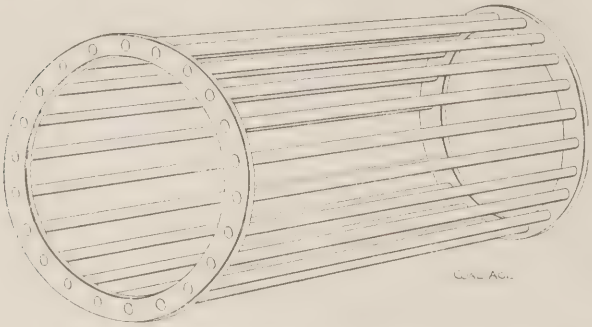

Fig. 2. Skeleton Squirrel Cage without Iron Core

Most Mines Use 3000 Volts

A large number of mines in the United Kingdom are supplied with three-phase alternating current at a potential of 3000 volts. In a few cases, 6000 volts are employed and transmitted to a point in the neighborhood of the individual mine. For coal-cutting service this current is transformed to 500 volts by stationary transformers and three-phase motors are employed at the above voltage at the coal face. Where continuous-current motors are used, the same potential is employed, and where the mine is supplied with alternating current, direct current is furnished by motor-generator sets or rotary converters in the ordinary manner.

Where alternating current is employed for driving coal-cutting machines, the wound-rotor motor has found most favor. This type of motor can be made to develop whatever torque may be required at starting, and the coal-cutting machine driven by it can start from rest under full load and cut its way into or out of the coal with as great ease as the continuous-current machine.

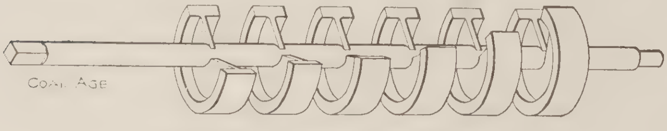

Fig. 3. Controller Drum

Both alternating- and continuous-current motors run at fairly high speeds, say from 500 r.p.m. upward, and the higher the speed, the smaller may be the motor for a given power. The bar type of coal-cutting machine has the advantage over the disk and chain varieties in that it runs at a much higher speed, say from 300 to 500 r.p.m., as against 20 to 70 r.p.m. in the other types. Consequently, a much smaller reduction is required between the motor shaft and cutting apparatus in the bar type of machine. With any form of coal cutter, however, some kind of reducing mechanism is required, and with the bar and chain machines, gearing is also necessary to drive the haulage drum by means of which the machine pulls itself along the working face.

This gearing is frequently the source of trouble, owing to the teeth clogging with the dust made by the machine. Cutting in the coal has the advantage, as coal dust does not appear to injure the gearing, while clay or bone dust does. Spur gearing is principally employed with beveled gears wherever necessary. Worm gearing has, however, been introduced to a limited extent.

Starting Apparatus a Disadvantage

Both continuous-current and three-phase alternating-current wound-rotor motors have two serious disadvantages when employed to drive coal-cutting machines. Both require special starting switches and resistances, and in the space available in coal-cutting machines for accessories, these may be a source of trouble. With the continuous-current motor, full line voltage should not traverse the machine upon starting. Should such a potential be delivered to the machine, it is probable that the insulation of its coils would be seriously damaged.

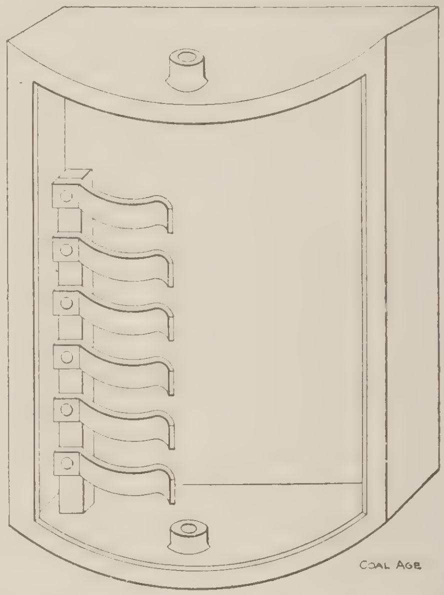

Fig. 4. Controller Case and Contact Fingers

The operation of the continuous-current motor depends upon its generating a reverse potential as the armature revolves. This cannot be done at starting under the conditions ruling if full-line voltage is delivered to the brushes. Consequently, some form of resistance must be interposed between the supply and the motor terminals. Also some form of switch must be employed which will cut in the whole resistance at starting, gradually diminishing it as the armature gets up speed.

With the wound-rotor motor a somewhat similar arrangement has to be made. Upon starting, a resistance must be inserted in each of the three circuits of the motor, the switch provided therefor being arranged so as to gradually cut out this resistance as the machine speeds up, completely short-circuiting the rotor coil when normal speed is attained.

The weak points in both these pieces of apparatus are the switch contacts and the resistance. The switch contacts may cause sparking as they move from one section to another, while there is always the danger of overheating or the failure of a junction causing sparking there. These dangers which exist under all conditions of motor service are particularly pernicious in the case of coal-cutting machines, on account of the small space available and the possibility of the presence of coal dust.

The form of switch which has been evolved for use with either continuous- or alternating-current motors is a modification of the well known street-car controller. In the case of coal-cutting machines, this is known as the drum type of switch. In this controller a drum of insulating material upon which are mounted segments of brass or copper, one below the other, each subtending a different angle at the center of the drum, is mounted within a suitable case. Attached to the inside of the case are a number of springs carrying brass fingers, which made contact with the segments of the drum, as shown in Figs. 3, 4 and 5. Connections are so made in this apparatus that when the drum is revolved by means of the operating handle outside of the casing, full resistance is thrown across the terminals of the motor, this being gradually diminished until in the final position the whole of the resistance is cut out and in the case of the alternating-current machines, the coils short-circuited.

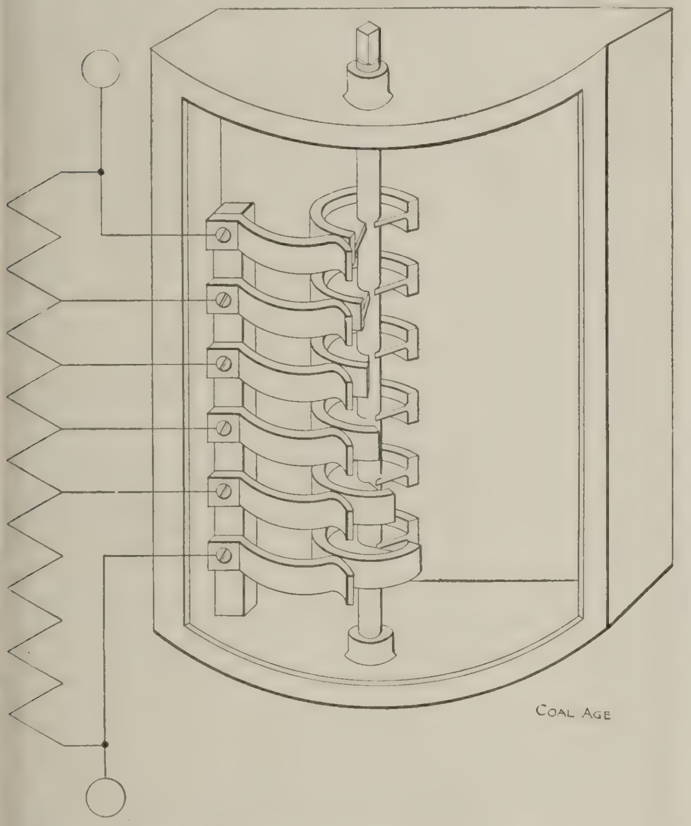

Fig. 5. Assembled Controller

Drum Controller Is Most Advantageous

The drum controller has many advantages. It can be placed in a small space and possesses rubbing contact. The fingers and segments slide upon each other, and thus tend to keep each other clean. Sparks pass between fingers and segments when connection between them is broken, but these may be subjected to the action of a blowout coil and the casing can be made practically air tight. The adoption of the drum switch and of the grid form of resistance, both of which ideas came to the United Kingdom from America originally, has apparently solved the problem of operating electric coal-cutting machines so far as the control of the resistance is concerned.

In the grid form of resistance the metal is stamped or cast in a zigzag form, as shown in Fig. 6, a certain number of grids equaling a predetermined resistance, there being a minimum of joints. This form of resistance also dissipates the small quantity of heat liberated during the starting period. This is a decided advantage over the old continuous-wire form of resistance.

The connection between the current-supply wire and the machine is perhaps the most troublesome problem involved in driving coal cutters electrically. In longwall workings, the coal face may range from 100 yd. up to half a mile, or even more in length. It is reached by roads protected by pack-walls leading from the haulage road. Down these "gate" roads, temporary supply wires are led to the neighborhood of the coal face. From here, what is termed a "trailing" cable carries the current to the machine.

The Greatest Difficulty Is with the Trailing Cable

Although the temporary wires along the road require considerable attention, since they are subject to falls, the main difficulty arises with the trailing cable. Between this conductor and the wire extending down the gate road is placed a gate-end switch box. Various forms of these boxes have been developed during the past 10 or 15 years, all of which were designed to not only prevent the machine operators from getting shocks but also to prevent explosions in the box itself. Figure 7 is a diagrammatic sketch of a typical gate-end box for three-phase service. It is made of cast iron with a hinged cover, and wide, carefully machined surfaces where the different parts of the box join.

The box is divided into two main compartments, one for the switches and the other for the fuses, one switch and one fuse being supplied for each phase of the current. Horizontally, also, the box is separated into six compartments, one for each switch and each fuse. The three switches are operated simultaneously by a handle on the outside, and the box cannot be opened until the switches have first been opened. Thus, when changing a fuse there is no danger of shock.

The trailing cable connects to the box by a plug which has four contacts, three for the three-phase conductors, and one for the ground wire. The three-conductor armored cable passes through a gas-tight gland, the armor being connected to the body of the box, to which the ground wire of the trailing cable is also connected. Where unarmored cables are used, a ground wire is led to a terminal in the gate-end box, to which the ground wire from the trailing cable also makes connection.

For continuous-current work, the same arrangement is followed. There are, however, only two switches and two fuses instead of three.

It is now usual for the trailing cable in three-phase work to consist of four conductors, and in continuous-current work, three conductors. The third conductor with continuous current and the fourth with alternating is the ground wire.

Throughout the United Kingdom, there has been a considerable controversy over the question of armored versus unarmored cables, and it has been decreed by the Home Office that armored cables shall be used in the majority of cases. The armor must be connected to ground at the bottom of the pit and also at the top. Furthermore, this armor must be maintained continuous. It has been decreed also that the armor shall be of sufficient electrical conductivity to carry any leakage current that may arise. This maintains the electrical potential along the outside of the cable as well as that of anything which the covering touches at zero, that is, the entire cable surface is grounded. In order to insure metallic continuity in the armor, joint boxes are employed. These bridge over the break in the armor at splices in the cable and protect them from dampness and mechanical injury. At the face, the ground wire is connected to the body of the gate-end box and to the frame of the machine. This is to avoid accident due to the machine being ungrounded. In several instances, the man who follows the machine, manipulating the haulage or guide rope, has been fatally shocked by it, owing to the whole of the machine being alive. By connecting the armor of the supply cable to the frame of the machine, the latter and all parts connected thereto, such as the haulage rope, are reduced to a zero potential, and the operator should be able to handle the haulage, or traction rope, or any other portion of the apparatus, except the brushes, in the case of a continuous current machine, or the equivalent parts of the alternating motor with perfect safety.

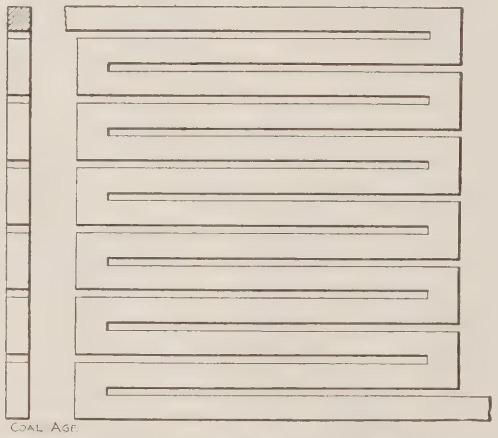

Fig. 6. A Resistance Grid

Difficulties Encountered in Maintaining the Insulation

Two serious difficulties have in the past arisen in the matter of maintaining the insulation of the trailing cable in a sufficiently perfect condition to protect the workman handling the coal-cutting machine from shock, also the insulation of the conductors as they pass into the machine. This trailing cable, of course, follows the machine along the face. It lies upon the floor and is subject to all the rough handling incident to proximity to actual mining operations. Lumps of coal and rock, iron tools, etc., fall upon it; the men walk on it, and the like. Various methods have been employed to overcome this difficulty, but apparently without success until recently.

A method of insulation which has met with considerable success in the United Kingdom is by covering the three- or four-conductor cable, as the case may be, with an outside envelope of a special quality of rubber. It was discovered by accident, as usual, that the rather low grade of this material employed for sheathing cab tires possesses important properties. It has considerable mechanical strength, resists oil, dampness, acid, fumes and almost all other ills to which trailing cables are subject. It is easily repaired in the factory when injured, and it is, of course, a simple matter to keep a spare cable on hand.

All the leading British cable makers are now turning out trailing cables covered with what is known as cab-tire sheathing. This appears to have surmounted the difficulty of injury to the trailing cable.

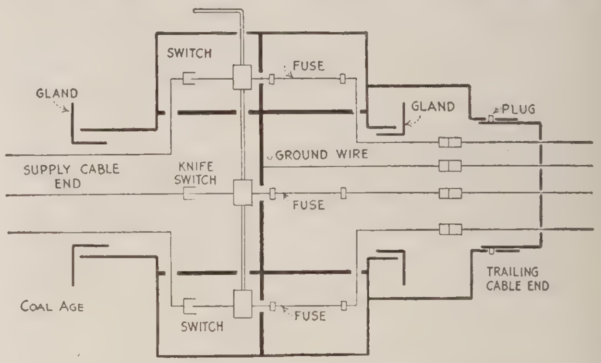

Fig. 7. Diagram of a Gate-End Box

The difficulty of insulating the conductors as they traverse the inner portion of the machine and of protecting the metallic switch, etc., has been met by a liberal use of mica and improved methods in working the same. Mica tubes are now employed, consisting of thin sheets rolled upon a mandrel and tied in place until they are slipped into the position which they are to occupy, usually holes in castings. In this form, it is necessary to hold the mica in place after it has been rolled or it would expand and fly open.

In this connection, it has also been discovered that there is mica and mica; furthermore, that micanite, which is used for many purposes in connection with the manufacture of electrical apparatus, will not answer where high voltages are employed, or where mechanical strength is required. Mica varies decidedly in its qualities, and if a poor insulation of this kind is employed, it has a pernicious tendency to break down, allowing the very connection to be made which it was intended especially to prevent, resulting in trouble, delay and danger.

⁂

All rescue apparatus should be maintained in an effective condition. It should be under the charge of a skilled man. Periodic overhauling should be insisted upon. The men who form the rescue corps should be carefully trained under conditions as nearly similar to those of the mine as can be reproduced.

⁂

The advantages of packing in longwall mining are: (1) A greater degree of safety, as roof falls are fewer. (2) There are no places in which gas can accumulate. (3) Absence of coal dust, most of it being behind the packing. (4) Reduction of the cost of timbering, as props can be withdrawn before the pack is built up and reset over and over again. (5) Increased output from the same length of working face. (6) Fewer men required. (7) A more rapid advance. (8) Roof and main roadways in much better condition. (9) Fewer cross-roads are required. (10) Less surface damage, due to caves.

Chart for Coal Purchasers

By W. V. Bowles

Although coal is bought for evaporating water, few buy it on an evaporative basis. The reason usually given is that the human element or "error" cannot be accounted or compensated for. Most engineers agree that the evaporative basis is the correct one on which to buy coal.

Assume a plant which requires, say, 3000 or more tons of coal a year, and it is desired to purchase coal on an evaporative basis. The first thing to do is to run a test on the boilers with various coals and make a chart from the records obtained. The accompanying chart is plotted from a stoker plant and illustrates the idea and plan of procedure.

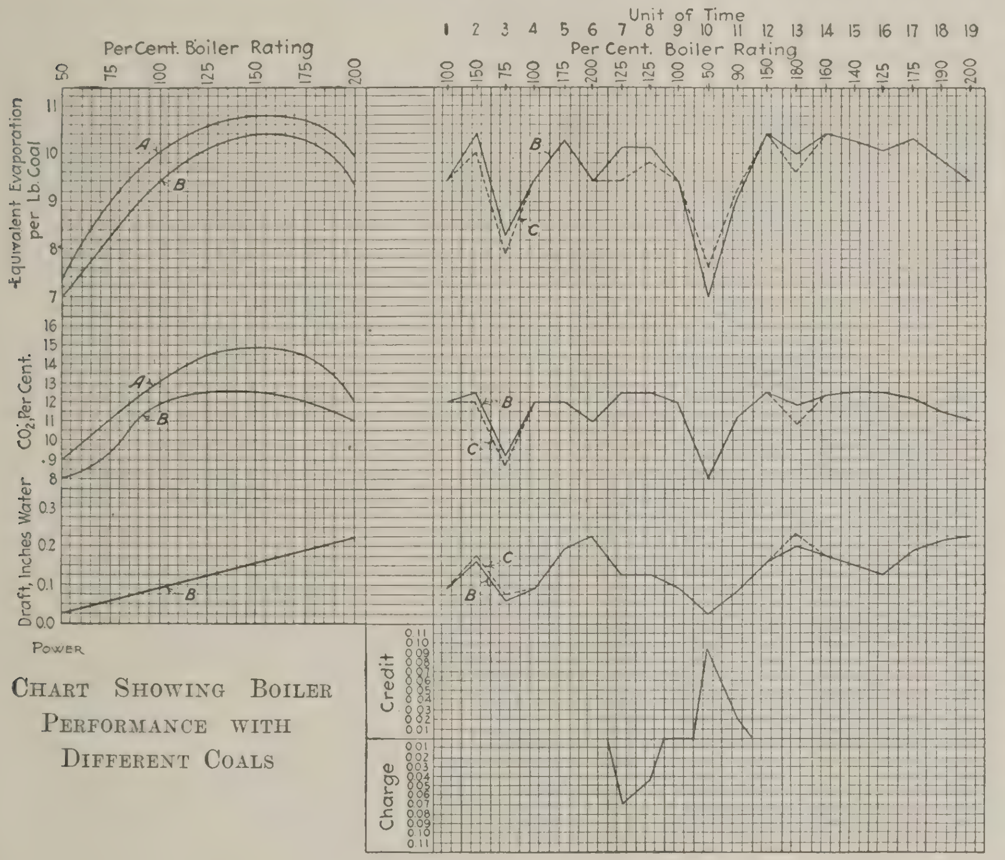

Chart Showing Boiler Performance with Different Coals

It is understood that the coal company should have a competent representative present during the test and at the calibration of all instruments and to have access to all records. First, the attainable evaporation and CO_2 curves are plotted at all boiler loads, together with a curve showing the best draft to use. Below is plotted a curve showing what is in the plant, termed "the adopted standard." This is based on a longer test when uncontrollable conditions may be taken into account.

The chart is also divided into a number of time periods, hours or days, as may be found most suitable. As each period is ended the average boiler rating is marked at the top, and below is plotted the adopted standard.

Referring to the charts under period 2, it is found that the average rating was 150 per cent. The equivalent evaporation should be 10.4 lb. per pound of coal, but the actual evaporation fell off to 10 lb. Following down the column, may be found the reason. The CO_2 dropped from 12½ to 12 per cent. Following still further down the column, the draft has increased from 0.16 to 0.175 in., showing the operating force to be at fault. A similar condition is indicated in the next column.

Under period 7 the evaporation dropped 0.069 per cent., but the operating conditions were according to adopted standards, when the coal company is penalized an equivalent of 0.069 on the coal burned during that period. If a better evaporation is gained than is shown by the standard line, as in period 10, the coal company is given a bonus equal to the increase; in this case, 0.092 per cent. If a shipment of bad coal comes in and the operating conditions are allowed to deviate from the standard, both will be shown in their correct proportion.

It may be found desirable to add draft lines to show conditions in other passes of the boiler, also temperature curves from the various passes. With proper checks on drafts, temperatures and CO_2, the human element can be accurately checked and accounted for; so there appears no good reason why the human element should control or influence the purchase of coal on an evaporative basis.

Such a chart should be an excellent thing to carry along from day to day for the benefit of the plant, even though it is not intended to buy fuel on this basis, for it will show the value of the firemen in dollars and cents.

Like all other kinds of record keeping these charts require much time to be made out. But in plants large enough to warrant checking of performances of apparatus a clerk is available who can plot curves from the tabular matter given him. Cross-section paper may be purchased that will fit nicely into large loose-leaf book covers.

COLLIERY NOTES

In rebonding old tracks, it is often advisable to use exposed bonds, since if the splice bars are removed from the old rails, the bolts frequently have to be cut, and it is often impossible to successfully draw the plates back into their original space.

An English authority has pointed out that most of the coal used in England for steam raising purposes is purchased in an unscientific manner. He suggests that if the coal was bought on rational lines, a saving of from 7 to 10% could be effected. This authority calls particular attention to the importance of the ash contents in coal. He stated that if the ash has a low melting point, the bars always become choked. The presence of sulphur generally results in the corrosion of furnace bars, boiler tubes and economizer tubes. This action is much more pronounced if steam jets are used under the furnace. The final suggestion was that all coal contracts should be arranged on a sliding scale basis, and payments should be made according to the heating value, a certain standard being fixed and a greater or less price should be paid according as the quality of the coal rose or fell from this fixed standard.

The Labor Situation

SYNOPSIS—The arbitration scheme in eastern Ohio is halted. The sale of the Bache-Denman property to the Union may not be consummated. A strike occurs in West Virginia against a change in the basis of payment, though the contract gives the operator freedom of choice.

After all, the miners' officials did not agree to arbitrate the eastern Ohio strike, and there is still a deadlock. The joint conference continued at the New Hollenden, Cleveland, during the greater part of last week without any tangible result. C. J. Albasin, the district president, is said to have been hopeful of a settlement, but what he hoped might happen is hard to understand.

What the Miners Wanted

The operators were ready to arbitrate and even agreed to make the scale of the arbitrators retroactive, so that it would apply from the time the men went to work. But the miners wanted 47c. per ton, at once, as the price of machine-mined run-of-mine coal, and they proposed that there be five arbitrators, two appointed by the miners, two by the operators and one by the other four.

They did not want a retroactive scale, but wanted the arbitration board to fix a date when their labors were completed. Thus by deadlocking on the selection of a fifth arbitrator, and perhaps by later delays, they could secure for themselves the 47c. rate for a long period of time.

If the operators declared that they could not pay so much and closed down, the cry of bad faith would be raised. If they stood the loss, it would be clear to everyone that they could afford to stand it indefinitely. The operators desire to pay 58c. for lump and 22c. for slack coal till the award is made.

The conferences adjourned on Friday, Feb. 5, to meet again on Monday, Feb. 8. Meantime, in deference to the investigators, nothing has been done to reopen the mines under "open-shop" rules.

The Ohio Legislature May Act

There was an informal meeting of the members of the mining and labor committees of both houses of the Ohio General Assembly to discuss the feasibility of starting an investigation into the labor situation in eastern Ohio. Many of the members of these committees were opposed to suggesting such an investigation on their own initiative, and it was practically decided to steer clear of the proposition at this time. Perhaps the legislature will be called upon by the presentation of a resolution or bill to make the investigation later, and it can then be taken up.

Representative Tetlow, of Columbiana County, has prepared a resolution which will be introduced in the General Assembly, providing for a thorough investigation of freight rates for coal shipments. It has often been charged that the present rates discriminate against Ohio operators, and it is believed the question can be settled once for all by the investigation. The resolution has the support of both operators and miners.

The Glens Run Coal Co. is asking to have its eviction orders dismissed, and no one is being evicted from company houses. The miners are comforted by this and by the fact that they are now assured that the shoes supplied them by the union may be worn by them and their families. C. J. Albasin says they are practically a gift from a school in Newark, and that permission to accept them had been granted by Charles Baine, the secretary of the International Boot and Shoemakers Union at Boston, Mass. A rumor has arisen that miners, driven out of Arizona by a smallpox epidemic, are to be brought to Ohio to work in the mines.

A Run-of-Mine Controversy in West Virginia

There is a strike at the Ronda mine of the Coalburg Collieries Co. on Cabin Creek in West Virginia. It appears that the mine has been run on a run-of-mine basis. The operators desire to avail themselves of a clause in the contract, permitting them to place their schedule on a screened-coal basis. The miners quote Clause 10 in the contract, which states:

> The mining rate per ton for splint or hard coal covered by this agreement is fixed upon a run-of-mine basis; screen lump coal may be mined and paid for on a lump basis, on a basis of 30 per cent. nut and slack over a 1½-in. screen.

The miners claim they are breaking the coal so fine that 35 per cent. of slack is made and therefore that the operators have no right to change the schedule to a basis framed on 30 per cent. of slack. But Clause 10 seems to make it clear that the change can be made at the option of the operator. It is said that the Dry Branch mine is also to be run on the screened-coal basis.

The rate proposed is 43c. per ton for the lump coal, and this, figuring on 30 per cent. of slack, is somewhat better than the present price for run-of-mine, which is 30c. per ton. The difference in favor of the miners is a cent on every 10 tons, if no more than 30 per cent. of slack is made as provided. D. C. Kennedy, the operators' commissioner, has been in Florida. The commissioner for the miners is John King. It is believed that the commissioners will decide that the company is well within its contracted right.

The Union May Not Buy the Bache-Denman Mines

The sale of the Bache-Denman properties in Arkansas to the United Mine Workers of America is said to have failed, but the statement has been denied. The Sebastian County Coal & Mining Co. is owner of much of the coal and the Union anticipated that these royalty holders would be well pleased to replace two tipples which union violence had destroyed. They should, of course, rebuild as often as the mob sees fit to destroy them.

Possum Hunters Menace Western Kentucky

The activities of the "possum hunters" in the western Kentucky coal field have subsided noticeably in the past two months. This change of conditions is attributed partly to the extreme weather conditions which have prevailed and partly to adverse public sentiment. While the mine operators are still pursuing their policy of vigilance, the county sheriffs have done much to relieve the tension by putting deputies on duty in the districts where the "possum hunters" have been most active.

At the recent session of the Circuit Court at Greenville, in Muhlenburg County, the judge granted the Commonwealth attorney's petition for a change of venue. Indictments against alleged "possum hunters" will thus be tried before juries in remote communities.

The Butler County Circuit Court, in session at Morgantown, convened Feb. 1. Judge McKensie Moss, of Bowling Green, delivered a vigorous charge to the grand jury, in which he urged a rigid investigation of the outrages alleged to have been committed by the "possum hunters." For many weeks the citizens and mine officials have been kept in a state of alarm by the periodical raids. A coal-mine tipple at Island Station was burned and many men and women have suffered whippings at the hands of these night-riding bands. Not only have these latter defied the law themselves, but they have threatened those who sought to interfere.

Despite Intimidation, Testimony Is Obtained

One farmer in Butler County was warned not to testify before the grand jury in Morgantown. Nevertheless, he appeared before the jury and told all he knew of the depredations. Under his arm he carried a gun loaded with buckshot.

Judge Moss said he would continue the court for two weeks if necessary to bring to justice the guilty parties.

The Hopkins Circuit Court now in session in Madisonville is likewise probing the "possum-hunter" outrages. Johnson Williams, who, while actually acting as guard for the Kington Coal Co., was whipped by the "possum hunters," was indicted by the grand jury for carrying concealed weapons. He was acquitted, however, when the necessity for his personal protection was established by the defendant's attorney.

The Carbondale Coal Co. resumed operation during the past week after a suspension of over two months. "Possum-hunter" raids caused such a general and constant alarm in this company's camp that a shutdown was necessary. Sixty-five negroes have been imported during the past few days from the neighboring camps, and, with the assistance of the county sheriff, the Carbondale concern feels that no further trouble is in store for it.

The Aftermath of the Colorado Strike

One hundred and fifty indictments for murder, arson, assault and rioting have been found by the grand jury in Colorado. Among those arrested are Eli M. Gross, state superintendent of free employment bureaus and vice-president of the State Federation of Labor; William T. Hickey, secretary-treasurer of that federation, and Charles Haines, secretary of the United Mine Workers at Walsenburg, Colo. Judge C. C. Butler, of Denver, Colo., will try the cases at the call of Judge A. W. McHendrie, of the third judicial district.

Electrical Development in 1914

By F. R. Davis*

SYNOPSIS—Refinement of design and an increased size of the units employed were the most noticeable characteristics of the year's progress. The demand for storage-battery and combination locomotives is increasing.

While some unique developments characterized the progress in the electrical industry during 1914, the general advance has consisted largely of improvements in apparatus that had already attained relatively high efficiencies, both electrically and mechanically.

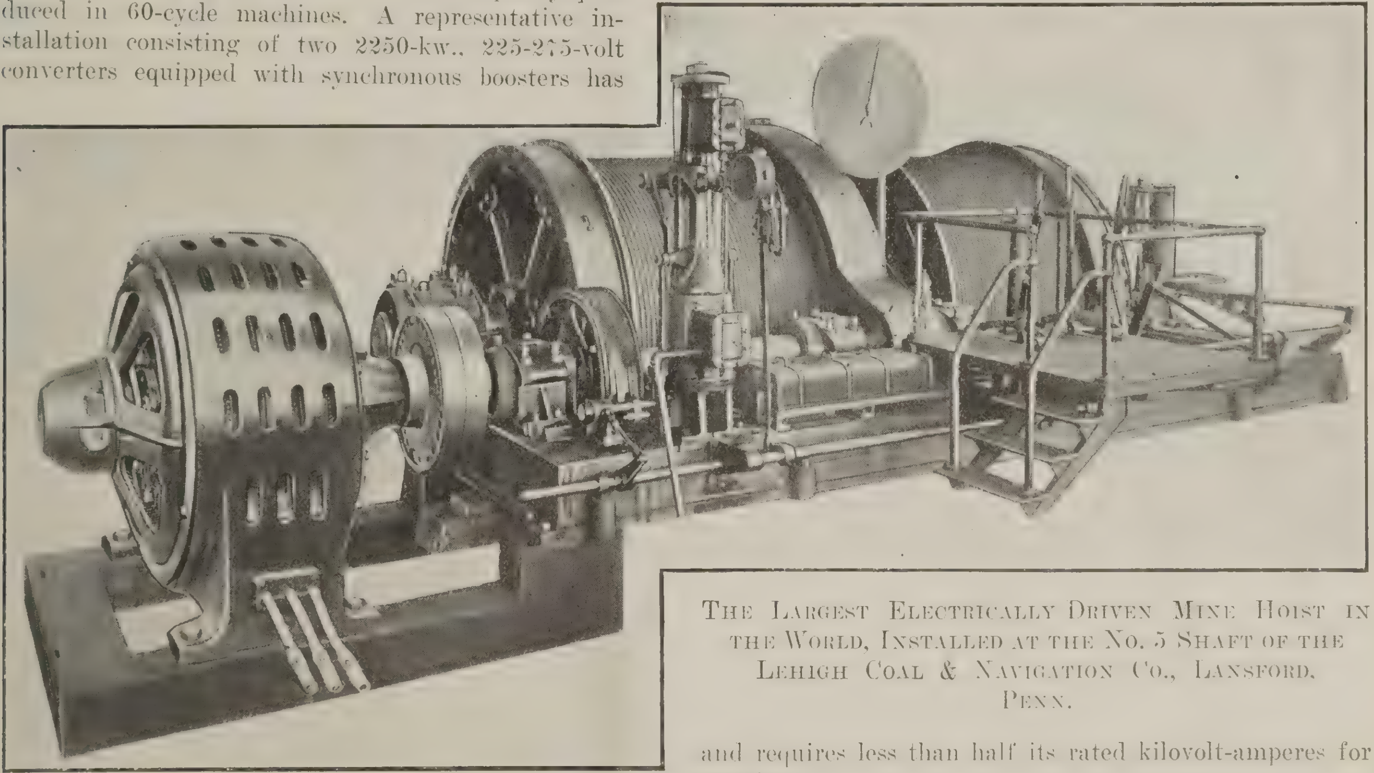
The essential features of the achievements attained embrace a marked refinement in design resulting in increased efficiencies for many classes of apparatus, economical concentration of large energy values in single machines, and a broadening of the field of application based on experiment and analysis of exhaustive operating data.

The advance in synchronous converters has been marked chiefly by the increased unit capacity produced in 60-cycle machines. A representative installation consisting of two 2250-kw., 225-275-volt converters equipped with synchronous boosters has been constructed for the Boston Edison Co. These machines have approximately 50 per cent. greater capacity than any 60-cycle machines of this type heretofore developed, and their successful operation has resulted in the adoption of still larger units.

The equipment of synchronous converters with synchronous boosters, which are integral parts of the complete machine, together with the arrangement of wattmeter control, constitutes a most important improvement in synchronous converter operation and insures a positive and automatic adjustment of the direct-current voltage. This is accomplished through control of the field excitation of synchronous converters provided with commutating poles. It insures correct excitation at all loads and voltages instead of a step-by-step correction, which has heretofore been necessary. The new system obviates the use of contactors in combination with a number of resistance steps, which were formerly required, and has been applied with entire success during the year to both 25- and 60-cycle units of the synchronous booster type.

A horizontal-shaft 6000-kv.-a., 50-cycle, 500-r.p.m. synchronous condenser constructed for the Southern California Edison Co., of Los Angeles, is of unusual interest, due to the fact that it was designed for operation on a 16,500-volt line, no machines of this type having been previously built for potentials exceeding 6600 volts.

In addition to the precautions necessary for insulation against this unusual potential, special efforts were made in designing the machine to minimize the losses; and as a result, there was produced a synchronous condenser of very high efficiency, utilized solely for power-factor correction. It is self-starting by means of a compensator and requires less than half its rated kilovolt-amperes for starting.



THE LARGEST ELECTRICALLY DRIVEN MINE HOIST IN THE WORLD, INSTALLED AT THE NO. 5 SHAFT OF THE LEHIGH COAL & NAVIGATION CO., LANSFORD, PENN.

Prior to 1914, the largest core type of transformers as produced by the General Electric Co. did not exceed 2000 kv.-a. in rated capacity, but during the year the maximum rating was carried up to 7500 kv.-a. The maximum rating of single-phase water-cooled, shell-type transformers was also increased by the construction of four units of 8333 kv.-a. capacity.

There has been a marked reduction in interruption to service in transformers of recent design, as they are now capable of withstanding momentary short-circuits under sustained primary voltage without injury to the coils. This has been accomplished largely through changes in the grouping of the coils and working to higher inherent reactance.

---

*General Electric Co., Schenectady, N. Y.

A feature of unusual interest for the year is the development of a combination transformer which may be operated either self-cooled or water-cooled. It may be designed for normal operation with water circulated through the cooling coils, in which case, it may also be safely operated at 50 per cent. of normal load without the circulation of water and without exceeding its specified temperature rise.

On the other hand, this transformer may be designed for normal operation as a self-cooled unit, and be provided with the necessary cooling coils, which, when utilized, permit operating efficiently at 50 per cent. above the normal capacity.

The economical advantages of such transformers are obvious, especially for localities where the purchasing rate of water is high and the transformer is fully loaded only part of the time. This design also provides a factor of safety in case of interruption in the water supply, in which event the apparatus may still be operated at partial load instead of being shut down.

With the steady growth in the size of power plants and distribution systems, there has arisen among operators a fuller conception of the practical value of providing ample protective equipment, such as voltage-reducing devices for cutting down the station voltage under short-circuit conditions, arcing ground suppressors for short-circuiting arcs caused by grounded phases on delta connected transmission systems, and the recently developed and improved current-limiting reactances. A fuller appreciation of such devices is amply attested by a continual increase in the number of propositions for power-station equipment including this class of apparatus.

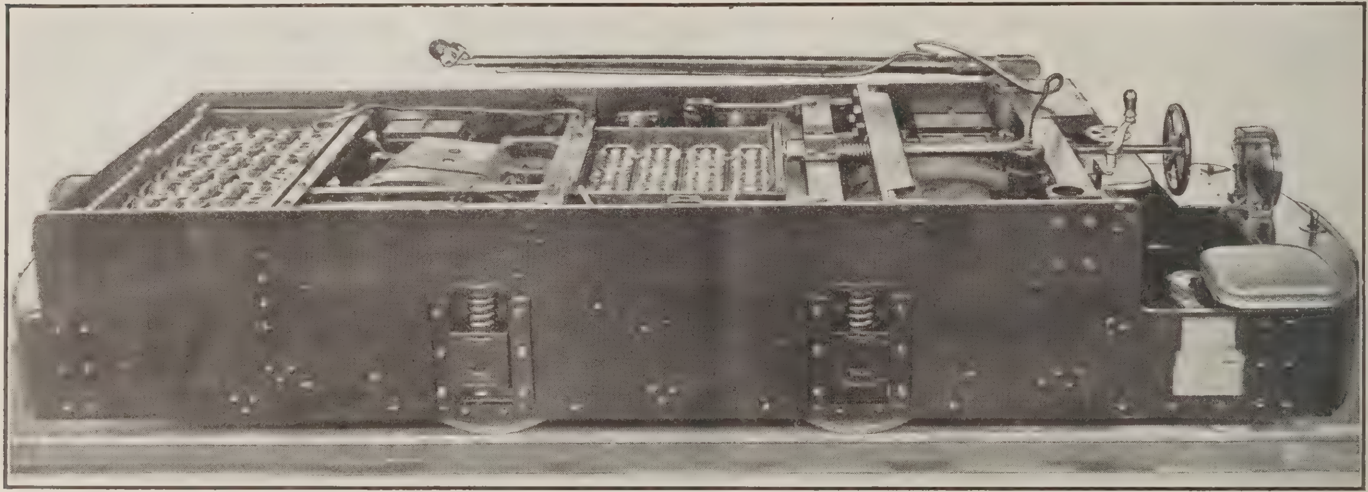
Reactances have been improved to a considerable extent during the past year, and the changes made have been based largely on the experience gained in numerous applications of the earlier types utilized for the protection of feeder lines. In order to facilitate calculations on the equipment necessary to meet the requirements of power systems having widely varying operating conditions and capacities, these reactances are now made in three distinct forms.

Commutating Poles and Ball Bearings Are Standard

All of the mine locomotives manufactured by the General Electric Co. in 1914 were provided with commutating pole motors and ball bearings as standard equipment, and the operating records of those placed in service during the year show that these improvements have reduced the number of interruptions to service and have resulted in decreased maintenance costs.

The increasing output of many mines has rendered it necessary to equip them with locomotives of relatively large capacity, capable of handling heavy trips over steep grades and long hauls. For this class of service there have been built a number of three-motor, 15- and 20-ton locomotives. The 20-ton unit combines some unusual features in design and construction. The body is made of rolled steel, each side frame being cut from a solid rolled-steel slab, while similar material in conjunction with steel channels is used for the end frames. The three driving motors are each rated at 85 hp., and are of the split-frame type. These particular locomotives were built for 42-in. gage, but the same construction and capacity can be utilized for a minimum of 36-in. gage.

There has been a definite increased demand for the storage-battery type of locomotive for gathering work, as it has been demonstrated that in this service each machine will effectively displace two or three mules. Heavy units are not, as a rule, required, and the locomotives of this class so far provided have been rated at from 3 to 7 tons. Most of these are of the straight storage-battery type; but a limited number have, in addition, been equipped so that they can operate from a trolley wire when in the main headings of a mine.



Combination Trolley and Storage-Battery Locomotive

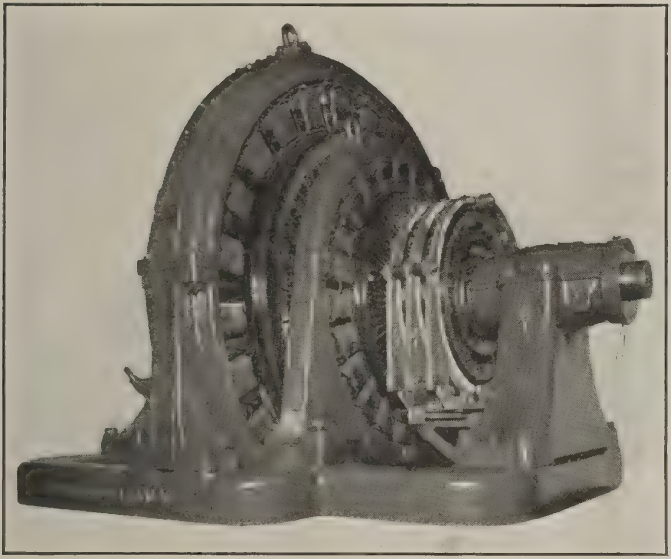
The advantages of this arrangement are obvious in that by means of a small self-contained motor-generator set, the battery may be automatically charged while the locomotive is running on the trolley. When the locomotive is working in the rooms, gathering the cars, a varying percentage of the battery charge will be consumed; but as soon as the machine is again operated on the trolley, these losses are automatically compensated.

With this dual system of operation, the battery need never be entirely discharged; and if space limitations are severe, it permits the use of a smaller battery than would otherwise be necessary. A representative machine of this type has been in operation in a West Virginia mine for a period of about four months. It runs on a 42-in. gage track and its overall height does not exceed 30 in.

The largest induction-motor, shaft-hoist equipment in America was placed in operation in November, 1914, at Lansford, Penn., for the Lehigh Coal & Navigation Co. The driving motor is rated at 750 hp., 300 r.p.m., using three-phase, 25-cycle current while the drive is through a single reduction gear.

Positive control of the hoisting speed is secured by means of an improved type of liquid rheostat and high-tension air-break contactors, the motor circuit being 2300 volts. This hoist serves a 600-ft. vertical shaft, hoisting 11,500 lb. per trip at the rate of 90 trips per hour with a maximum rope speed of approximately 1600 ft. per minute.

The liquid rheostat referred to above was developed primarily for mine-hoist service and insures safe operation at quick reversal. It employs two sets of fixed electrodes at different elevations. One set is widely spaced, while the other has large electrode areas and small spacing in order to obtain a very low final slip. The two sets of electrodes are connected in parallel after the electrolyte has reached a certain level corresponding to a predetermined decrease in rotor voltage. All parts of the rheostat itself are stationary, thus insuring absolute reliability. The electrolyte level is varied through the operation of a movable weir and a small motor-driven pump.



A SYNCHRONOUS CONVERTER WITH REVOLVING-ARMATURE SYNCHRONOUS BOOSTER

THE SMALL SUBSTATION

There are numerous localities remote from low-voltage distribution, but accessible to high-voltage transmission lines, where the small rural substation can be economically utilized for the distribution of electrical energy in capacities as low as 3 kv.-a. Under proper conditions, a market of this kind offers the operating company a sound financial basis for service, providing that the equipment can be installed at a reasonable price and can be depended upon to operate with low maintenance expense. The great extent of the field for this class of electrical equipment is indicated by numerous successful substations for small towns, farms, mines and quarries, pumping outfits, small isolated manufacturing plants and various contracting and construction jobs.

Experience has shown that, to avoid interruptions to service, the equipment supplied to meet the operating conditions indicated must be proof against damage from the weather, and, in order to provide this protection, all operating parts of switching apparatus which are liable to rust should be subjected to special treatment.

While considerable work had been done in the effective equipment of rural substations prior to 1914, the activities of the past year have been along the line of standardizing apparatus suitable for use in connection with various transmission voltages and in improving or redesigning standard apparatus previously utilized.

The complete standardized line now available has proved reliable in service and is designed to minimize danger to the equipment in case of disturbance on the main line; and, while it is proof against injury to itself or other apparatus, it does not require skilled attendance. Furthermore, it is largely semiportable, so that it can be installed or removed promptly and economically, and the fact that the entire line has been standardized permits an accurate predetermination of the cost of a rural substation when the operating conditions and service requirements are known. It also makes it possible to secure for the small community many of the economies inherent in high-tension transmission.

The vast number and varied character of the developments in the modern electrical industries render it exceedingly difficult to give in limited space comprehensive description of the progress made in any year. In this reference to a limited number of specific examples, it may be reiterated that most of the apparatus and devices cited, all of which were built by the General Electric Co., have already been subjected to the stresses of commercial service and have successfully withstood operating tests.

*

Extracts from a Superintendent's Diary

I bought a ten volume Encyclopedia of History today from a young lady book agent; I did not particuarly need the books but the young lady so evidently needed money and encouragement that I could not resist the appeal.

This is not the first time that sympathy has made for an increase in the size of my library; in fact many of my books have been added for somewhat similar reasons.

It naturally follows that there are some books in my library that are seldom opened, but they are far from useless, nevertheless.

Ofttimes I go to my library in search of peace and quiet after a day of worries and weariness, and when I open the bookcase I have no idea as to the volume that I shall choose; it is at such times that a book with a history, quite independent of the matter between its covers, is liable to attract my attention and almost before I am aware of it, a complete picture from the past is flashed on my mind and I wander off in reverie.

I have two books in particular whose bindings seem to possess almost hypnotic power over my imagination. One is a book of precepts published by a clergyman more than a century ago. It was given to me by an old lady who has long since passed away. To my shame, I must admit that I have never read one-third of its contents, but all of the events of that lady's life, the circumstances that led up to the presentation, the heart-to-heart talk that accompanied it, and her interpretation of the precepts, all these are written on the back of that book as legibly as are the printed lines within its covers.

In some mysterious manner this dear old lady has accomplished, as concerns me at least, a task that only the greatest of authors are able to accomplish; she left behind a living, breathing message.

The other book came into my possession as a reward for a charitable act.

It was also written over a century ago and was brought into our camp by an old man, a dissipated wretch who before his death had disposed of all his earthly posessions to satisfy his craving for drink, with the exception of it and an old miniature of rare beauty. His affection for the book and miniature was explained after his death.

Because I paid the burial expenses, the proprietor of our camp's boarding house insisted that I should take the book and miniature.

Out of curiosity I read the book, and from marginal notes, I soon discovered that the last owner was a grandson of the author of the book, and the miniature was a likeness of his grandmother. The marginal notes made by the grandson show that he inherited the wanderlust from the grandfather, but the grandfather's genius did not accompany it. He had talent enough, however, to make his grandfather live again for me in the book which I now own through criticisms and remarks scrawled along the margins of the pages.

All of which leads me to believe that book knowledge is not an absolute necessity to insure the selection of a library that may bring joy and comfort to its owner. And I find much satisfaction in that conviction when my friends take a fling at the titles I have accumulated.

I started out with well defined ideas about the kind of library I wanted, but as with all well laid plans, I find unaccountable impulses have been responsible for most of the decisions; in appraising the library that has resulted, I cannot see where I should like to make any changes.

⁂

Saving on Your Coal Bill

Dr. William Thomas, the efficiency expert, has recently drawn attention to the fact that in every dollar's worth of coal, a considerable saving may be effected by observing a few common-sense rules.

Whether you use a kitchen range, a hot-air furnace, a steam heater, an open grate or what not, it is the saving in waste which counts for most. After all, it is a matter of surface extent which figures in waste and coal consumption.

For each quarter of an inch of soot and fine ashes on a furnace, your coal loses 80 per cent. of its heating efficiency. For each sixteenth of an inch of soot on the inside of your stove, your coal used loses 25 per cent. of its heating capacity.

Plainly, then, the cue for the housewife, the janitor and even the easy-going *paterfamilias* is to clean soot away from each nook and crevice of every kind of a heater. To clean them two or three times a season is not enough. They should be cleaned every week.

Drafts require particular attention in the way of cleansing. Pipes, cracks, doors and folds in the sheet iron which goes to make up the furnace, range, or other kind of heater, should be especially looked after.

In this way one ton of coal will be made to give several times as much heat as it formerly did.

Explosion at Carlisle Mine in West Virginia

By S. A. Scott*

On Saturday, Feb. 6, at 7:40 a.m., an explosion occurred in the fifth left off the third right entry of the Carlisle mine. Because of the excellent condition of the other parts of the mine, the explosion was confined to this one entry. Bratticemen and firebosses went to the scene immediately and succeeded in saving four men who had been overcome. By 9 a.m. the superintendents and mine foremen from adjoining mines arrived and the work of rescue was started in earnest by 11 o'clock. The work of bringing out the dead was then started, being completed by 6 p.m.

Twenty men were killed and four were injured. One of these latter may yet succumb to his injuries. The mine in general was not damaged to any extent except the stoppings on the fifth left entry and the door of third right at this point. These were blown out by the force of the explosion.

At about 3 p.m. State Mine Inspector John I. Absalom arrived, his colleague, Lance B. Holliday, joining him about 5 o'clock. About 2 a.m. on Sunday the Bureau of Mines rescue car No. 8, temporarily located at Coalwood, W. Va., arrived at the mine.

Tipple at Carlisle Mine Where Recent Explosion Occurred

The work of rescue was directed by myself assisted by my assistant, T. C. Thomas, and the company's inspector, Edwards Grass. Assistance was tendered by all the companies operating the surrounding mines. It is likely that work will be resumed in about a week.

[The Carlisle mine is operated by the White Oak Fuel Co., a subsidiary of the New River Co., the post office being also Carlisle. The mine is at the head of the White Oak branch of the Chesapeake & Ohio Ry. and is located in Fayette Co. The bed operated is the "Sewell" and connection with the surface is by a shaft. The seam runs from 3 ft. 4 in. to 4 ft. 3 in., but apparently averages 4 ft. in thickness.

The last inspector's report (1912) states that the mine is gaseous, and that the roads in second and third right headings tend to get too dry and dusty and have to be kept watered down. Apparently the requisite care had been taken to keep the dust moist, for the explosion did not spread. A correspondent informs us that the disaster was caused by a door boy with an open light entering a room marked as dangerous.—Editor.]

Editorials

The Net Output of Anthracite

It is to be regretted that over one-tenth of the anthracite production is consumed at the mines for heat and power, and the proportion thus utilized seems to be on the increase. If this greater consumption arose from the introduction of mining machinery we could feel that it was justified, but entirely different causes for the growing consumption per ton produced must be sought.

In 1892 the U. S. Geological Survey put the consumption at 8.3 per cent. of the total output. In 1903 it was still only 8.5 per cent. according to the then newly formed Pennsylvania Department of Mines. In 1914 it had mounted to 10.2 per cent.

During the life of that Department and the chief inspectorate of James E. Roderick the amount of water handled per year has decreased from 13 tons per ton of coal produced to 11.7 tons. This is a considerable reduction and it would seem that the decrease in volume can hardly be equaled by the increase in depth. So that the water problem cannot be, as might be thought, the cause of the increased weight of coal consumed per ton produced.

Some increases in the coal used may be due to the power required for more perfect preparation. A more important cause may be the use of inferior coals under the boilers. However, if the coal used in 1903 contained 6 per cent. of impurity—surely too low a figure—the coal used in 1913 if it gave only equal power would have to contain 21.8 per cent. This figure as an average is probably higher than an investigation would show.

Other causes for increased use of coal are more numerous haulage systems, extensions of those existing, increased hoisting depth and the replacement of drifts by shafts. Still we wonder why the anthracite region as a whole has not balanced these increased drains by a proportionate economy.

It is perhaps not possible to compare the anthracite collieries with the bituminous mines of the country, for the water to be handled in the latter is not so great nor are the mines so deep. Furthermore some few mines obtain power from coal-oven heat or gases. Yet even after admitting the difficulties of the comparison, it does seem strange that the bituminous mines, inefficient as many of the plants are, used in 1913 only 2.44 per cent. of the coal produced or roughly one-fourth as much as the anthracite collieries.

Is some of this apparent inefficiency in anthracite plants due to the use of steam lines such as we have seen installed—one, for instance, 14 in. in diameter which together with a 5-in. extension was over a mile long? Is it due to the use of cylindrical boilers, which we hope are now only reserves, but which still form 11 per cent. numerically of the whole equipment though only 3 per cent. of the horsepower capacity?

Is it due to the existence in actual use of some valuable relics in the way of steam engines for which a museum of patents like those in London and Berlin should be provided? Is it the result of excessively long haulages and unnecessarily disconnected activities?

This we do not know—certain it is that while to the anthracite region we may look without disappointment for some of the most uptodate equipment we may also find there some plants which serve only to recall the early triumphs in the long and honorable history of engineering in the anthracite region.

We append a table showing the tonnages produced, the tonnage used for steam and heat at the collieries and the percentage the latter forms of the former as calculated from the state reports:

TABLE SHOWING PROPORTION OF COAL CONSUMED FOR HEAT AND POWER AT THE ANTHRACITE PLANTS OF PENNSYLVANIA

Year	Tonnage Produced	Tonnage Used at Plants for Steam and Heat	Per Cent.
1903	75,232,585	6,395,582	8.501
1904	73,594,369	6,912,358	9.393
1905	78,647,020	7,122,394	9.056
1906	72,139,510	7,198,140	9.978
1907	86,056,412	8,217,439	9.549
1908	83,543,243	8,320,032	9.959
1909	80,223,833	8,103,810	10.101
1910	83,683,994	8,396,895	10.034
1911	90,917,176	9,152,073	10.066
1912	84,426,869	8,804,759	10.429
1913	91,626,964	9,357,762	10.213

⁂

At Home and Abroad

We have frequently pointed out that the conditions obtaining in the United States are not exactly paralleled in Europe and that certain measures in one country would not always give similar results in the other. Much has been made of the success in Germany in creating a system of syndicates, from which greater profits to industry have accrued. Steadier operation, less poverty, more complete conservation, increased safety, and greater efficiency are also alleged. These contentions are also true in a degree—what degree is hard to determine exactly.

Certainly greater returns to industry are desirable because only by the accumulation of profits can efficient operation be secured, and they are of value also as an encouragement to thrift. Moreover they are needed in bituminous coal mining, if the absorption of the independent operator by the railroad on which he ships in the hard-coal region is not to be completely duplicated in the soft-coal industry. Already in large parts of the bituminous field, the independent operator has become a small factor, the railroad, steel, and even the copper interests having such large operating investments.

But while profits are assured both for capital and labor by combinations of the former, the other advantages we have listed are not so certain. Steadiness of operation is as much threatened by market conditions as by an excess of productive ability brought on by unrestrained trade. As for poverty, the miner makes less per day in Germany under syndicates than he does here. The eliminating of privation is almost wholly due to the first alleged byproduct of syndication—steadiness of operation—and this we shall consider in detail later.

Conservation may come as an outcome of law, or as a result of the largeness of the initial outlay which puts a high premium on the coal in the ground, or because of the high value of the mineral in place. An assured profit would rather *permit* than *induce* operators to be less wasteful of resources. The most profitable way to mine coal is unchanged by an increase in the selling price of the product, so long as new coal reserves can at any time be acquired. As soon as they cannot, the value of coal lands will increase without syndication, and conservation will be self-enforcing.

As regards safety as a result of syndication, we must say that we are not impressed with the safety exhibited in German mines, believing it more largely due to natural safe conditions than to any other cause. As for greater efficiency, this is apparent only in machinery, not in output per man. We concede, however, that greater profits should have the effect of increasing the output per man and per ton of coal utilized for power and heat.

We pass over these matters lightly but we wish to discuss the item, steadiness of operation, at some length, because we believe the coal operator has been disposed to credit to German and indeed to British shrewdness a condition in which those people have exercised little or no control. We take issue with those who ascribe to intelligent provision what is really the outcome of sheerest luck.

A pamphlet entitled "A Statement of Facts concerning Conditions in the Bituminous Coal Industry in the States of Illinois and Indiana" states that "The average number of working days per annum in these two states is only about 175 out of a possible 300 or more." The same pamphlet shows a diagram exhibiting the number of shifts worked in the Westphalia district in Germany for several years. It averages well over 300.

But in Europe the market is not nearly so seasonal as in America. In England and Germany, which are not so agricultural as the United States, the demand for coal for industry occupies a more dominant position. And industry is the flywheel of the coal trade, at least in correcting the annual variations of the demand.

Moreover as the temperatures never become as low in Germany or England as they do here and as the winter is shorter these conditions again accentuate the importance of the industrial demand. Furthermore, as the coal freightage is an important item in railroad operation, the demands of the locomotives are immensely increased in the winter by the demand for coal, and thus the conditions which disturb the uniformity of trade have secondary effects, which disturb them further in their turn. Nor should we overlook the effect of wintry storms in adding to the consumption of coal in locomotives, by their injurious effects on the operation of railroads.

It also should be noted that both Germany and England have a large trade in warm countries where the demand is wholly industrial and where wood is largely used to supply what little heat is needed for cooking and house warming. The avidity with which Italians seize on store boxes and even tree limbs and carry them away for firewood is not so much the result of real thrift as of national custom. The sales of the European mine owners to tropical and near-tropical countries help to smooth the curve of seasonal variations in the coal trade of Europe.

Furthermore the bunker and coaling-station trade of Europe, which is large, goes on unceasingly through the winter and summer, though this has probably less effect in steadying trade in Germany than in Great Britain.

Now, among coal-producing states in this country, Indiana and Illinois by reason of their closeness to the agricultural states, into sixteen of which their product goes, suffer severely by the lack of balance caused by the seasons and must continue to suffer more or less in the very nature of things.

Unfortunately the United States, like all countries where the people as individuals enjoy a high degree of prosperity, suffers severely from ebbs and tides in industrial activity.

Moreover, because our credits are large, we are the first to suffer when a depression comes. Thus the flywheel of the coal trade, which is industry, is inefficient, and sometimes we wonder whether the domestic or the industrial trade is the reciprocator and we question which demand should be regarded as the flywheel. In 1914, for instance, it was the domestic demand which proved the more reliable. But in Europe both the industrial barometer and the thermoscope show less variation than they do here and the Westphalia Syndicate has little or nothing to do with that uniformity.

As we have said, however, more equitable, equable prices would be good for the industry, helpful to the miner and no loss to the country.

A Real Improvement in the Coal and Coke Business

From Birmingham, Ala., comes word that England has placed an order for 6000 tons of steel billets, that the rail mill at Ensley has prospects of uninterrupted operation for a considerable time, that the Italian government wants quotations on 250,000 tons of coal, and that the Hattie Ensley furnace broke three production records during January. West Virginia reports that conditions in the coal trade have greatly improved in the past 30 days and that production is rapidly increasing.

Out in Ohio, the Youngstown Sheet & Tube Co. is planning improvements in the way of byproduct coke ovens and a new mill to cost $6,000,000. In the Connellsville region of Pennsylvania coke ovens which have long been idle are awaking to new life. The H. C. Frick Coke Co. alone has put 2500 ovens into operation within the past month, and other furnace interests have made increases in like proportion. Throughout the Pittsburgh district generally, resumption of operations at mines and industrial plants is of daily occurrence.

Iron has long been regarded as an industrial barometer. When the country buys iron, it has money to buy other things as well, and usually buys them. The market for iron is reflected in that for fuel, for bituminous coal, and coke and gas. The facts and figures given above, while by no means indicating that a flood stage of prosperity is immediately upon us, reveal unmistakably that the slack water of depression is past, and that the tide of industry is setting in the right direction.

Connellsville coke production, which is a fair measure of iron production, has increased approximately 20 per cent. in the past month. All of this increase has been due to the activity of the furnace interests. In the language of a western Pennsylvania contemporary, "The Connellsville coke region is smoking up."

Sociological Department

The Colorado Fuel & Iron Co.'s Hospital

SYNOPSIS—The Colorado Fuel & Iron Co. has a large and efficient hospital at Minnequa, a point convenient to all its mines. Many model features have been introduced to add to the comfort of the patients and the success of the surgeons.

The Colorado Fuel & Iron Co.'s Hospital Force Has Twice Moved to Larger and More Convenient Quarters

The pertinacious Frank P. Walsh, chairman of the Commission on Industrial Relations, asked John D. Rockefeller, Jr., at the recent inquiry in New York:

> Could not a sociological department, such as Mr. Ford established, if it was set up in New York, keep you thoroughly informed concerning your employees?

Mr. Rockefeller replied without any show of irritation:

> It would be entirely possible. But Mr. Ford showed he was making many millions of dollars, and so he could develop such a department with entire justice to his stockholders. But I think you will agree in the case of the Colorado Fuel & Iron Co., where the common stockholders have had no returns for many years, it would not be fair to undertake sociological work.

Mr. Rockefeller, at that inquiry, showed only a slight acquaintance with the affairs of the company and his reply would seem to indicate that he did not know that sociological work of importance was being conducted at the Colorado Fuel & Iron Co.'s mines or that annual reports were being made on the medical and sociological departments. We do not know when the first report was made, but we have before us the printed records of the medical department for 1907-1908 and sociological reports showing a well organized activity in 1903-1904.

The public in the East does not know anything of the extremely valuable work which the company has done, simply because of the failure to make such work public. A state organization with half as much deserving would have an efficient press writer to blazen its good deeds.

It is creditable to the New York "Survey" that it has not failed to speak favorably of the sociological work of the Colorado Fuel & Iron Co. while condemning unsparingly the alleged restriction of personal liberty by that corporation; nevertheless we are sure that up to the present no one has done that hospital work its due meed of justice. It may be added that even J. L. Lawson, the agitator of the United Mine Workers of America, admitted on the stand that the Fuel Co. had a "good hospital."

The three-day inquiry of the Industrial Relations Commission was partly devoted to the task of finding out what Mr. Rockefeller did not know about the affairs of the Colorado Fuel & Iron Co. and in besmirching him with insinuations which he could not meet and defend, so little did he know about the matters in question. It did not serve, we fear, any good end and was purposed only to add luster to F. P. Walsh's dubious laurels. It is not every self-advertising agitator who has such a glorious opportunity to heckle a leading financier.

If he really wished to know about the Fuel Co. he should have asked J. F. Welborn in Denver, and he could have obtained the truth from him. The public is disposed to believe that what Mr. Rockefeller did not say for himself and for the corporation in which he is interested cannot be said. That this is not true, a few succeeding articles in Coal Age will abundantly prove.

The purpose of the present article is to describe the extensive hospital of the Colorado Fuel & Iron Co., situated on Minnequa Lake, just south of Pueblo. This hospital treats both mining and steel-works cases. It is situated outside the coal fields, but is more convenient of access than if it were located at any one of the many coal-mining centers of the company which are situated in no less than six counties—Las Animas, Huerfano, Pitkin, Gunnison, Fremont and Garfield.

The pioneer hospital was one-half of a double frame dwelling, the scantiest kind of an attempt to meet the needs of the situation. Later the whole building was used, but in November, 1883, a new hospital on Abriendo Ave., Pueblo, was completed and occupied, and to the company's medical advisers the new quarters appeared palatial. At first there were accommodations for 85 patients and later room was made for 40 more, but by 1900 these quarters were found too restricted, and the ideas of the company had developed so that the officers were no longer satisfied with the accommodations.

The Minnequa Hospital

It was decided therefore to build a fine hospital at Minnequa, where 20 acres of land were purchased, which has in the few years intervening become a forest.

It is not necessary to describe the hospital in full, for the pictures show how adequate it is for every requirement. It should be noted that it is practically only two stories high, so that it is exceedingly safe in case of fire. Furthermore every room fronts on the outside of the building. There are both X-ray and pathological laboratories. The former has a Scheidel-Western interrupterless X-ray coil with all accessories for doing the fastest and most deep-seated work. At the time of its installation it was the only machine of like capacity in southern Colorado and may yet be unexcelled.

The floor, ceiling and three of the walls of the operating room form a continuous sheet of lead, which reflects none of that cross light which is so annoying to the surgeon. The material is also waterproof, nonabsorbent and crackless; thus it offers no refuge for germs and no place which cannot be thoroughly cleaned. The floor is noiseless and not slippery. The fourth wall, which faces the north, is entirely occupied by a large sheet of plate glass, through which the room is lighted.

WHERE BABIES ARE BATHED AND WEIGHED DAILY
TYPICAL BED-ROOM
CONTENTED YOUNG AMERICANS

Where in Quiet and Sunlight Human Repairs Are Effected

The room in which anaesthetics are administered is painted in green and decorated with pictures and frames in sepia and other browns—colors which psychologists say are least irritating to sufferers. The curtains are white. A sensitive or nervous patient is especially affected by unpleasant surroundings, hence the less disagreeable and shocking the environment, the more a patient is likely to take an anaesthetic without resistance. A struggle involves loss of strength, which, of course, is detrimental to the patient during and after an operation.

So, to avoid unpleasant thoughts, the patient is allowed to see no instruments, no preparation for operation, no doctors, nor nurses in operative regalia, and to hear no sounds suggestive of operation. The anaesthetic is given by a specialist, assisted by a nurse who accompanies the patient from the ward. The subject is unconscious when removed to the operating room.

No Stairs in the Hospital

Another excellent feature is the fact that there are no stairs in the hospital. As Doctor Corwin states in his report, any given tread and rise in a stairway are suited to patients of a certain strength and height and ill suited to all others. They are never desirable for the travel of cripples and children and are never really safe.

Of course, an elevator is an excellent convenience, but it is inadequate in a fire. As the Minnequa hospital is only two stories high, it is possible to use slopes or ramps leading from the ground floor to the story above. Up and down these inclines the wheeled chairs and beds on rollers can be pushed with ease.

In 1913 a contagious-diseases ward was added. In the building pleasantly termed the Casa Vivienda, the doctors and nurses live in most comfortable quarters and here lectures are given to the latter. Laura A. Beecroft who graduated at the West Penn Hospital in Pennsylvania is matron.

THE NURSES' SCHOOL

These nurses take a three-year course. During the junior year they study anatomy, nursing, materia medica, bacteriology and medicine. The second or intermediate year they are taught anatomy, nursing, bacteriology, dietetics, materia medica, bandaging, nursing ethics and medicine. The senior year embraces the study of clinics, anatomy, obstetrics, bandaging, surgical technique and materia medica, and lectures are given on hygiene, gynecology, eye, ear, nose, throat and nervous diseases. The course includes three months' obstetric experience in a Chicago hospital.

PATIENTS' RECREATION HALL CALLED "SMOKE-HOUSE"
LAUNDRY
CONTAGIOUS PAVILION
DYNAMOS AT HOSPITAL POWER HOUSE
CARPENTER SHOP

THE HOSPITAL HAS AN EXTENSIVE EQUIPMENT AS WELL AS EVERY COMFORT

The operating table in the obstetric ward is cleverly arranged with wheels that can be raised or lowered so that there is no need to remove the patient to a litter but the table itself can be transported to the bedside, thus saving unnecessary lifting.

Each department is handled by experts. Dr. R. W. Corwin, the chief surgeon, attends all cases requiring the surgical care of the abdominal and pelvic regions. Dr. William Senger attends diseases demanding medical treatment and those needing surgical treatment of the head and neck. Obstetrics and surgery of the chest and extremities fall to Dr. Bon O. Adams. Diseases of the chest and the administration of anaesthetics are apportioned to Dr. R. H. Finney. Diseases of eye, ear, nose and throat are tended by Dr. J. J. Pattee. Dr. Josephine M. Dunlop is the pathologist. Dr. Philip Work acts as interne. Henri T. Mershon is the radiologist.

POLYGLOT HEALTH BULLETINS

Doctor Corwin issues a monthly bulletin on sanitary and sociological subjects. In September, 1914, it was about the health of infants; in October and November, about that of children. In December it discussed in plain terms the health of school children and the dangers of germs. These bulletins are translated into Polish, Spanish and Italian and being in the simplest of language cannot fail to convey their message of safe and sane living.

Subjects treated include alcoholism in infants, the crime of feeding children with all kinds of indigestible materials, the dangers of decayed and uncleaned teeth and the continual menace to which school children are exposed, if proper precautions are not taken, when drinking, eating and playing together.

Colorado has a healthful climate but as a result it is full of sickly people who come from other climes to recover their depleted strength. Consequently there is need for residents to be at least as careful to avoid exposing themselves to disease as in other states where climatic conditions are more trying to the afflicted.

As will be seen in the illustrations, the hospital has its own farm thus securing to the patients uncontaminated that part of the dietary which is most necessary for their well-being. Other pictures of the hospital will be published in an early issue.

THE MINNEQUA HOSPITAL FARM

Panama-Pacific Exposition First-Aid Meet

It was decided at the Terre Haute, Ind., meeting of the American Mine-Safety Association last year that the Third National Contest should be held at Pittsburgh in connection with the Second National Mine-Safety Demonstration. It will be remembered that the first demonstration, held Oct. 31, 1911, was practically the parent of the association. W. H. Taft, then President, W. L. Fisher, then Secretary of the Interior, and many other notables were present.

The second demonstration, however, was to be held as part of the dedication of the new Bureau of Mines buildings at Pittsburgh. Seeing that these will not be ready for dedication or occupancy till 1916, the demonstration must be delayed, so the advantage in holding the association meeting in Pittsburgh in 1915 is no longer apparent, especially as it is inadvisable to choose any one place for two consecutive years.

The Second Mine-Safety Demonstration will be at least as important as the first, as it is intended that the date shall be arranged so that the President and other important Government officials can attend as in 1911.

In consequence of the facts mentioned the secretary of the American Mine Safety Association, H. M. Wilson, engineer-in-charge of the work of the Bureau of Mines in Pittsburgh, invites suggestions as to the proper provisions to be adopted. He suggests that the meeting might be held in Ishpeming, Mich., or in Fairmont, W. Va., or possibly in Knoxville, Tenn. In the latter place it would be combined appropriately with the Annual Southern Interstate Contest. There are other places also where annual contests are held and these might well be considered as possible places for the Association's meet.

He also suggests that it might be well to consider the possibility of regarding the Panama-Pacific Field Meet as the Association's regular event. As this is so far in the West it is probable that only a few Eastern teams will compete. It is feared therefore that the event could hardly be regarded as national.

With the letter in which the above statements are made and suggestions invited is one also from Mr. Wilson asking for entrants for the meet at San Francisco, Sept. 23 and 24, and one from J. A. Holmes, director of the Bureau of Mines, requesting suggestions as to that contest.

It is proposed that the first day be devoted to a demonstration of skill. All who enter will be given souvenir banners, badges or other mementos. All teams will be rated by the judges but the two in any state which receive the highest award shall be eligible to compete on the second day for interstate supremacy and the award of prizes.

All teams are invited to enter. Each team will have to pay its own charges for traveling and maintenance, but there will be no entrance fees. It is expected that each team will provide its own rescue and first-aid equipment, though, on advance request, the Bureau of Mines may lend its artificial breathing apparatus. The Bureau is anxious to be of service and to aid in the instruction of teams desiring to enter. It invites suggestions of all kinds as to the conduct of the meet.

The contest at San Francisco will give the participants an enlarged sense of the value and importance of the great work in which they are engaged and stimulate not only the competing teams but those which have failed in the elimination contests for they will realize what a slightly greater proficiency in training might have won for them.

A Thought on the War

Charles Wagner in "Justice" strikes a happy note when he says the following:

"Along the ponderous lines of march of hostile armies ready for the shock of battle, among engines of war unknown to the ancients, I distinguish something still more foreign to them. It is a red cross, the common emblem of whole corps of doctors, guards and nurses, with the paraphernalia of their calling.

"Tomorrow, when war has done its work, and even in the thick of the fight, these people will rescue the wounded, bind up their wounds, watch over them, without asking to what country they belong. They will be doing the fine and simple deed that Christ immortalized in the parable of the Good Samaritan.

"As I look at them I think—this thing will kill the other. The sentiment which leads you to run to each other's aid, even under a rain of bullets, will some day be stronger than all the reasons put together that draw you into this inhuman warfare.

"The red cross will triumph over the cannon.

"The future belongs to the nurse, to the little gray sister, to all helpful powers, however humble; for two allies are theirs—suffering humanity and the merciful God."

Discussion By Readers

Mining Laws, Legislation and Mine Regulations

Letter No. 30—In the discussion of needed mine legislation there is no more important subject than the relation of the mine foreman to the state and state law in which the mine is located over which he has charge.

Attention has been drawn many times to the difficult position occupied by mine foremen and the suggestion has been made previously, Coal Age, Vol. 5, p. 899, that, in justice to a large number of this class of faithful and conscientious men, who are often placed in difficult situations by the requirements of the law, the mine foreman should be a state official, acting under the supervision and by the direction of the mine inspector of the district or state in which his mine is located. Such a provision of the state mining law may possess some legal difficulties; but these certainly cannot be greater than what exists at the present time. Reference was made to this condition by quotations cited from the bituminous law of Pennsylvania, in the letter to which I have just referred.

Anyone familiar with the situation knows that a large portion of the mine foreman's time is commanded by the Department of Mines or the state mine inspector, compelling him to see that the provisions of the mining law are strictly obeyed. On the other hand, the mine foreman is an employee of the company or operator of the mine, who demand his entire energy in maintaining the daily output of the mine at its full capacity. The foreman is, in fact, a "coal-getter" in the sight of his employer, but a safety inspector in the eyes of the law.

This condition and unfortunate position of the mine foreman have been well described in Letter No. 25, Coal Age, Jan. 30, p. 217, where the mine foreman is referred to as a "bumping block" between the inspector and the company. I believe safety in mines requires that the mine foreman should be placed on an equal basis with the district mine inspector if he is to be held responsible for the operation of the mine in compliance with mining laws. Such a provision would enable him to see that the law is carried out, without subjecting him to the danger of the loss of his position, as is the case under the present existing conditions.

It frequently happens that some of the most vital requirements of the mining law conflict with a company's policy or established methods in the operation of the mine; and this, naturally, places the mine foreman in an awkward position. His desire to please his employer often brings him into conflict with the law. No argument is required to convince one that there is, as stated in Letter No. 25, a "bad kink" in the mining law in this respect. If the purpose of the law is to insure the greatest safety in mining and reduce the number of mine accidents, why not remove the mine foreman from the unfortunate position in which he is placed by the requirements of the law and enable him to act freely as his judgment and knowledge dictate? To overcome the difficulty presented by the compensation of the foreman by the state, the law might require the coal operator to pay into the state treasury a sum of equal value.

In order to still further secure the position of mine foreman, in respect to the correctness of his judgment in the operation of the mine, the law should provide that the mine foreman shall be given a fair trial before removal from office, by an executive board composed of at least two district mine inspectors and one member of the operating company. In my estimation, this would be a just and practical way of removing the present intimidation under which the mine foreman is obliged to act at the present time

Philip M. Weigle.

Hooversville, Penn.

Letter No. 31—The discussion in Coal Age of what is needed to improve the present mining laws in different states calls to mind a very interesting problem that is now before the courts and the Pennsylvania state legislature as to the eligibility of certain applicants for mine foreman's certificates. According to the anthracite mine law, in order to obtain a mine foreman's certificate, the applicant must not only be able to pass the required examination, but must also give "satisfactory evidence of at least five years' practical experience as a miner." The question is now being fought out in the Pennsylvania courts, What is to be understood by the words "practical experience as a miner"? Does the law necessarily require a candidate for a mine foreman's certificate to spend five years in the actual blasting and loading of coal at the face; or may it mean that time spent in the mines, following the different lines of work necessary to the operation of a colliery?

Judge McCarrol, presiding over the Dauphin County court, recently handed down a decision in favor of the latter version; but an appeal has been made from his decision and the question will probably be carried to a higher court.

There is now a bill before the legislature introduced by Hon. A. B. Garner of Schuylkill County, to change the reading of this law, so as to make its meaning more definite if it is required that a man must actually mine coal for five years in order to become eligible for a mine foreman's certificate.

The question may well be asked, however, Is it necessary that a man should spend five years at the face blasting coal, in order to become a competent mine foreman? Let us look at the question from both sides and, to illustrate, take the careers of two young men working in an anthracite colliery.

Both of these young men, we will say, start in the breaker picking slate, but soon get jobs inside the mine tending doors or switches or spragging cars at the bottom of the shaft or slope. Later, following the ambition of most boys in mines, they will probably be found driving mules. From this point their careers may diverge: "A" having grown big and strong gets a job laboring for a miner in a gangway or breast. If in a gangway or flat breast, his principal duties for a time will be loading the cars and helping the miner to stand timber. After a while he is given a breast auger and starts drilling holes for blasting, working under the supervision of the miner, who prepares the charge and loads the hole.

After two years of this work, "A" is entitled to and obtains a miner's certificate. For three years longer, he works a gangway or breast as a miner, with one or more laborers to help him. During all this time his work has been strictly at the face and he has become very proficient in the shooting of coal and in standing timber. If the mine is a gaseous one and all of his section is on safety lamps he, of course, becomes familiar with the construction and use of the lamp. If he is observing he learns from the fireboss and the more experienced miners the manner of detecting and handling gas. If he is studious and ambitious, he studies in his spare time and takes the examination and is granted a certificate which qualifies him to take a position as fireboss, and later he becomes mine foreman.

Now, let us see what "B" has been doing all these years. Instead of getting a job of laboring for a miner, after driving mules, he works as a company man on repairs. He is put to work with one or two men who have been employed, possibly for several years, laying and repairing track, putting in switches, building and repairing brattices, batteries and stoppings. He is often called to assist in putting a derailed car or trip back on the track or to replace a set of timber that has been knocked out. The fireboss may call him to help run a brattice to the face of a gangway or breast where there is an accumulation of gas. Sometimes a pump runner is out and the foreman calls on him to take the man's place.

Thus, "B's" experiences are many and varied although he has never blasted a pound of coal; but he too is ambitious and observing. While repairing track or putting up brattice at a working face, he has learned how the miner makes his cut, places his holes, prepares the powder and loads, tamps and shoots the hole. In building stoppings and carrying brattice, he has learned the methods of ventilation and become familiar with the construction and use of the safety lamp. When assisting the fireboss he has noted the cap on the lamp when it is taken into gas, and observed the flame that is produced by a greater percentage of the gas, and has learned how to handle the lamp under these conditions. He has been taught how to carry off the gas without endangering the lives of the workmen. He is often called to go into old workings to lift track or draw timber and learns by experience the danger of blackdamp. The repairman is often sent to assist the engineers in making surveys. When laying track at the foot of a slope or on a plane, he sees the importance of the use of a blueprint or plan. He thus comes in touch constantly with important phases in mining that the man who spends all his time at the face never sees. He is called on to assist in the work of laying steam and water pipes to and from the pumps.

In short, there is scarcely any work necessary in the mining of anthracite coal with which "B" does not come in contact, sooner or later. While he has had less experience than "A" in the handling of explosives, the shooting of coal, the dressing of a face and setting timber, in all other essentials of mining he has had as much experience or more. Provided, then, that each of these men passes the required examination satisfactorily, is not one just as much entitled to a certificate as the other?

Geo. D. Evans.

Pittsburgh, Penn.

※

Longwall in the Pittsburgh Seam

I notice, in the excellent account given of the last meeting of the Coal Mining Institute of America, held at Pittsburgh, Dec. 8, 1914, that W. Seddon opened the discussion of the question: "Is the Longwall System Applicable to the Pittsburgh Seam of Coal?" It is stated, Coal Age, Dec. 19, p. 986, that S. A. Taylor followed Mr. Seddon and pointed out the lack of adaptation of the longwall system of mining to this seam, known in Ohio as the "No. 8 seam." Mr. Taylor is reported as saying that "the roof breaks up too high, sometimes as much as 20 ft.; and the bottom is too soft."

I fail to understand how this reference of Mr. Taylor's applies to the discussion of the longwall system of mining, since success or failure in longwall is not a question of the roof breaking high, but rather a uniform settlement of the overburden on the packwall and the waste of the seam. I would suggest that the longwall system, properly applied, avoids the "high breaks" that would occur in other systems of mining. The matter of chief concern in longwall work is that the roof strata immediately above the coal are not too frail, so as to permit the weight of the overburden to be thrown forward on the face sufficiently to break down the coal and, at the same time, keep the face open for work.

Neither does the fact that the bottom is "too soft" apply so much to longwall work as it does to room-and-pillar work; because, in the former case, the roof pressure is distributed uniformly over a greater area, while in the latter the weight resting on the pillars often causes a soft bottom to heave and obstruct the roadways, thereby causing much annoyance and expense. This condition is very largely eliminated in the longwall method when the packwalls are properly built and there is sufficient waste material. Moreover, there are in the longwall method less roadways to maintain and more space is available for storing the waste.

I would remind those gentlemen whose remarks did not favor the adoption of longwall in the working of coal in the Pittsburgh measures that many of the deepest shafts in the world are worked longwall. From one to three years were required to sink these shafts, which are equipped with the most uptodate machinery at great expense. The longwall system of mining has been generally adopted in these cases, because it means a more complete extraction of the coal, at a lower cost.

It is quite common for men not acquainted thoroughly with the principles and practice of the longwall system of mining to object to its adoption in their mines, preferring to use the old methods with which they are familiar. Some years ago, the Youghiogheny & Ohio Coal Co., in eastern Ohio, held monthly meetings. At one of these meetings, the longwall system was discussed by the men present, and it was remarkable to hear the numerous objections raised to this method, by men who were unfamiliar with its working. One of the superintendents said that "the roof would not stand"; another said that they "could not get the coal out of the rooms which were 200 ft. deep"; another asked, "How would it be possible to ventilate the workings on the longwall plan?" Many of these questions showed that the men were not familiar with the principles of longwall.

I believe that the conditions in eastern Ohio are as favorable for longwall work as could be desired. When one considers the expense of working a block of coal, say 400x800 ft. on the room-and-pillar plan; driving, say 50 rooms on 32-ft. centers a distance of 200 ft.; and sums up what must be paid for yardage in turning rooms and driving breakthroughs between them; and takes into account, besides the delay and cost of taking the machines from room to room to cut the coal, the laying of tracks in the rooms and switches on the entries and other expenses such as the increased cost of gathering the coal at the face, to say nothing of the large percentage of pillar coal lost beyond recovery, even the most skeptical must allow that the longwall system presents advantages not possessed by any other method of mining.

For example, contrast the conditions just mentioned with the fact that the longwall method permits the entire extraction of the coal with a large reduction of expense for maintenance of roads, timbering and ventilation, besides reducing the number of drivers and mules required and the mining of the coal in better shape, generally, with less loss in fine coal and dust. In my experience, one or two mules for an output of 500 or 600 tons in longwall work would compare favorably with seven or eight mules for the same output of coal in the room-and-pillar system of mining.

The extra expense for the building of packwalls in longwall work is more than compensated for by the reduction in other expenses that I have mentioned. It would be necessary in adopting this method to form a new scale for machine men and loaders, since this work would not be as difficult or consume the time that would be required in room-and-pillar work. I would suggest, in closing, that the adoption of the longwall system of mining coal, in eastern Ohio, might prove the solution of the present strike difficulty in that state.

The Mine Superintendent

Letter No. 1—The foreword, Coal Age, Nov. 21, p. 815, arrested my attention; I read the same with great interest and care. It is the story of a superintendent of a coal mine who, in an attempt to bridge over the market conditions that were seriously embarrassing his manager, proposed to reduce the cost-sheet by temporarily cutting out the yardage account for driving new entries.

He very generously suggested to the manager that he could recover this by double-shifting the entries at a later time when market conditions were improved. When this improvement came, however, the demand for coal found the mine superintendent unable to bring the daily output up to the desired point; and for this he was severely censured by the mine manager, who laid the entire blame for the shortage on the superintendent's shoulders.

Assuming that this is a supposed case, I fail to find any justification for the implied suggestion that the results called for the superintendent's resignation. In any judicial case, where a second person is privy to a deal, he is held equally guilty with the first party. I would suggest that, in the present instance, the manager had every confidence in his superintendent, and together they agreed on a plan that would reduce the cost of producing coal. Both were alike responsible for the results. It may be assumed that the manager was afraid that the outcome would cast a shadow on his reputation and fearful of being criticized for an error of judgment, he laid the whole blame on his superintendent. However, no man with red blood in his veins would do this, but he would share the responsibility with his superintendent.

This superintendent, with a heart as big as a pit wagon, with neither malice nor prejudice, and loyal to his manager as Damon to Pythias, was purely the victim of circumstances. The unfortunate conditions that resulted in the superintendent's downfall might have been avoided, possibly by a modification of the system of mining, with a view to reducing the price paid for narrow work. Or, perhaps, the selling price of the coal might have been advanced by improving the quality of the output; or by producing a greater percentage of lump coal that would bring a higher price, by using a different powder for blasting or by a different system of mining the coal.

However, with great generosity, he suggested a method by which he assumed the entire burden of the condition prevailing in the market. I am forced to the conclusion that the manager had two codes of ethics, one of which he applied in his dealing with the superintendent, while he employed the other in all transactions with his board of directors or stockholders. I agree fully with the moral suggested in Coal Age, namely: "It is easy to overrun a credit account." But I am convinced that the *manager* and not the *superintendent* was the guilty party in this respect.

The story teaches that extreme economy is neither wise nor prudent, and any false measures employed to tide over a depressed condition are always expensive in the end. It would have been better for this condition to have been met by the manager making arrangements for deferred payments on interest-bearing debts, or in some similar way, as the trouble arose from a depressed market condition for which the operation of the mine was not responsible.

Effect of Head on Motor in Pumping

Referring to the inquiry of Richard Todhunter, asking what will be the effect on the motor driving a centrifugal pump if the discharge head is reduced from 150 ft. to 75 ft. while the motor is operated at the same speed, Coal Age, Jan. 23, p. 178, permit me to say that I think the pump engineers are in error when they claim that "the motive power is considerably overloaded" owing to a large quantity of water passing through the pump when the latter is discharging under a reduced head.

In the assumed case, the pump motor has a constant speed, which means that this motor is shunt-wound. If the head under which the pump discharged were to be increased from 150 ft. to 300 ft. I would say that the motor would become overheated and burn out under the increased load; but, in the present case, when the discharge head is decreased from 150 ft. to 75 ft. and the load on the motor reduced thereby it would be impossible for the machine to be overloaded. Under the reduced head, the amount of water pumped will undoubtedly be greater than before; but the rate of increase in quantity is not as great as the rate of decrease in head; and, as a consequence, there is a decrease of load and the motor will perform its work more easily than before.

For the sake of illustration, let us estimate the power required to operate the pump—first, under a head of 150 ft. and then under a head of 75 ft., assuming a general efficiency of, say 65 per cent. in each case. The size of the pump not being given, I will assume that it is capable of producing a velocity of 400 ft. per min. in the column pipe under a head of 150 ft., which gives

$$G = \frac{0.7854 \times 4^2 \times 400 \times 12}{231} = say\ 260\ gal.\ per\ min.$$

We may assume that, under this head, there is a slippage of, say 15 per cent. Then, 260 gal. per min. is 85 per cent. of the theoretical discharge of the pump, which is therefore 260 ÷ 0.85 = say 300 gal. per min.

The loss by slippage in the pump will vary directly as the square root of the head, which would make the loss when the head is reduced one-half $\sqrt{0.5} = 0.7$ of the loss in the first case. The loss in the first case was 300 — 260 = 40 gal. per min.; and, in the second case, it is 40 × 0.7 = 28 gal. per min. This makes the discharge under the reduced head, 300 — 28 = 272 gal. per min., as compared with 260 gal. per min. under the full head of 150 ft.

Now, estimating the power required to operate the pump in these two cases, we find,

First case, $H = 0.00034 \times 260 \times 150 =$ say 13 hp.
Second case, $H = 0.00034 \times 272 \times 75 =$ say 7 hp.

Electrically, assuming a line voltage of 220 volts, the current consumption in each case would be, since 1 hp. = 746 watts,

First case, 746 × 13 ÷ 220 = 44 amp.
Second case, 746 × 7 ÷ 220 = 24 amp., nearly.

I think this illustration, showing as it does a lower power consumption under the reduced head, should prove that a shunt-wound motor having a constant speed could not be overloaded by reducing the head of discharge.

Explosive Mine Gases—The diagram given below combines, in a compact form, most of the important reactions and data, relating to the combustion and explosion of those mine gases that form explosive mixtures with air. In the upper left-hand corner is a graphic illustration of the relative extent of the explosive and inflammable zones of each of these gases when mixed with air. The horizontal lines, in each gas column, mark, approximately, the maximum explosive point and the lower and upper explosive and inflammable limits; also the fatal percentage is indicated by the dotted lines. These marks are explained by the legend in the upper right-hand corner. The specific heats are given for equal weights of the gases, for constant volume and constant pressure, referred to water as unity.

DIAGRAM OF EXPLOSIVE MINE GASES

The Coal Age Pocket Book

Diagram of Testing Lamps—The diagram given below is of interest in connection with the testing for gas with different types of safety lamps burning hydrogen, alcohol, naphtha or a nonvolatile oil. In the upper right-hand corner are given the heights of flame cap or elongation of flame caused by different percentages of methane or marsh gas present in the mine air. The presence of other gases or dust will, of course, modify the results, as has been previously explained. The effect of carbon dioxide is to diminish the length of the flame and destroy the cap. On the other hand, carbon monoxide and dust lengthen the flame and assist the formation of the cap.

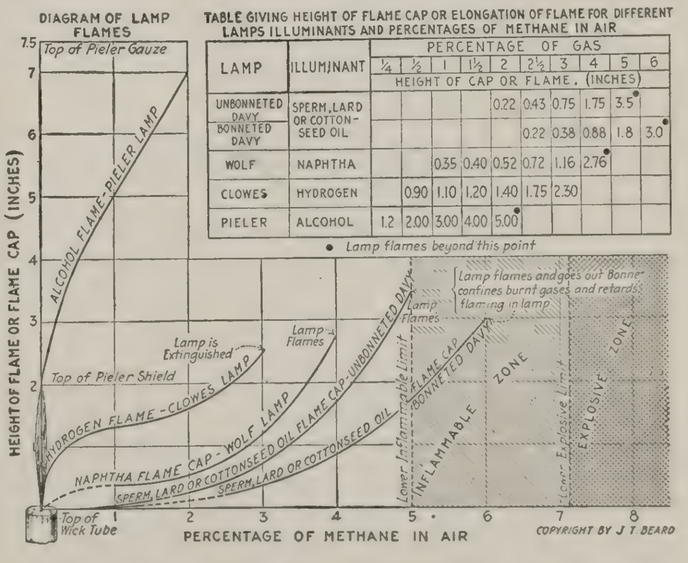

TABLE GIVING HEIGHT OF FLAME CAP OR ELONGATION OF FLAME FOR DIFFERENT LAMPS ILLUMINANTS AND PERCENTAGES OF METHANE IN AIR

LAMP	ILLUMINANT	PERCENTAGE OF GAS

DIAGRAM OF FLAME CAPS IN TESTING FOR GAS

The heights of flame cap given for the Davy and Wolf lamps are the minimum caps, produced by drawing down the flame to its lowest point. The heights given for the Clowes-hydrogen lamp and the Pieler (alcohol) lamp are for the elongation of the flame due to the gas. The original flame of the Clowes lamp is 0.3 in., while the flame of the Pieler is adjusted so that its tip reaches the top of the shield at a height of 2 in., as marked in the diagram.

Inquiries of General Interest

Safety-First Bulletin

Kindly give the name of the bulletin or paper issued by the Safety-First Organization, which was recently organized in the United States. I have made some inquiries and learn that such a bulletin is published, but I have been unable thus far to discover the name of the paper or where it may be obtained. I understand, also, that the Welfare Department of the U. S. Steel Corporation issues a paper of the same character.

INQUIRER.

Washington, Penn.

There are several publications of this nature issued by different corporations and interests. A bulletin entitled "Safety" is published monthly by the American Museum of Safety, 29 West 39th St., New York City. This bulletin is free to members, but a charge of 15c. per copy is made to others desiring the same.

A publication entitled "Safety Engineering," but known popularly as the "Magazine of Safety," is published by the Safety Press, Inc., 80 Maiden Lane, New York City.

Another publication entitled "Human Engineer" is edited by Winthrop Talbot, M. D., and sold at 25c. per copy, or $1 per year. Address the Human Engineering Co., Sta. B, Cleveland, Ohio.

The U. S. Steel Corporation publishes from time to time a safety bulletin entitled "Standard Requirements for Safety." We understand that this bulletin is issued by the corporation in the interest of its employees, with the purpose in view of increasing their knowledge and appreciation of what is required to secure the greatest degree of safety in the performance of their work. There is, naturally, a limited supply of this publication. It is issued by the Committee on Safety and Welfare, of which C. L. Close, 71 Broadway, New York City, is chairman.

⁂

Permissible Mine Lamps

Will you kindly publish in the columns of COAL AGE, as early as possible, a list of the different types of safety lamps and electric lamps that have been approved by the Federal Bureau of Mines for use in coal mines.

INQUIRER.

Dubois, Penn.

The above inquiry was submitted to the Bureau of Mines at Pittsburgh, and the following reply has been received from J. W. Paul, mining engineer in charge of mine-rescue work and appliances, for the bureau. Mr. Paul states as follows:

"In reply to your letter of Feb. 1, permit me to say that the bureau has not as yet established a list of safety lamps approved for use in gaseous mines; but there is now in the hands of the printer a schedule of tests that will be made by the bureau for the purpose of establishing such a list. When this has been printed, which should be within a couple of weeks, copies will be sent to the various lamp manufacturers inviting them to submit lamps for test for determining their permissibility. The tests heretofore conducted on safety lamps were made at the instance of the chief of the Department of Mines of Pennsylvania for his information in approving the lamps for use in the bituminous mines of that state.

"As for portable electric mine lamps, the bureau, about a year ago, adopted a schedule of tests for establishing a list of permissible lamps; and so far has approved three lamps, the Hirsch, Ceag and Wico, as being safe for use in gaseous mines."

J. W. PAUL, Mining Engineer,
Bureau of Mines.

Pittsburgh, Penn.

⁂

Extracting Pillars by Machines

Kindly explain the method in use of extracting pillars by machines in coal mining, assuming that the conditions in the seam are favorable to the use of machines.

MINE FOREMAN.

Pittsburgh, Penn.

In extracting pillars by machines, two general plans adapted to different conditions of roof and floor are employed. Where the roof affords sufficient support, the rooms are driven up the usual width of 7 or 8 yd. When this is done, a cut is taken through the pillar at the face, with the machine. This cut is made the same width as the rooms. Having cut through the pillar at the face, a stump 5 or 8 ft. wide is left and another cut made with the machine through the pillar the same width as before. In making these cuts, the coal is loaded out as it is mined, after which the stump 5 or 8 ft. wide is removed with a pick and that coal loaded out. A third cut is then taken through the pillar, the same width as before, leaving a stump 5 or 8 ft. wide, which is removed with the pick after the coal cut by the machine has been loaded out. This process is continued until the entire pillar is removed back to the entry stumps.

Under less favorable conditions of roof and floor, the rooms are driven up narrow, say 4 or 5 yd. in width, leaving pillars between them varying from 10 or 20 yd. to 100 yd. in width. When the rooms have reached the limit, a cut 4 or 5 yd. wide is made with the machine through the pillar at the face; and this being done, the pillar is worked back on the retreating plan, by undercutting the coal with the machine across the entire width of the pillar, and loading out the coal as it falls. In this method one or two rows of posts are set parallel to the face, leaving room only for the machine to work. As each successive cut is made across the pillar and the coal loaded out, a new row of posts is set, after which the row in the rear is drawn, allowing the roof to fall. In this manner, the entire pillar is worked back to the entry stumps.

Examination Questions

Miscellaneous Questions

(Answered by Request)

Ques.—Describe the following methods of haulage: Self-acting incline or gravity plane; electric-motor haulage; rope haulage on slopes; endless-rope haulage and main-and-tail-rope haulage. State where and to what conditions each is best adapted.

Ans.—In a self-acting incline or gravity plane, the arrangement permits the descending loaded car to haul the empty car up the incline. These two cars are connected by a rope that passes over a drum or sheave at the head of the incline, and the movement of the cars is regulated by a brake on the drum.

Electric-motor haulage, as its name implies, is a plan in which electric locomotives are used to haul trips of loaded cars out of the mine, returning with the empty trip.

Rope haulage on slopes is another name for engine-plane haulage. In this plan, the engine is generally located at the head of the plane and draws the trip of loaded cars up the incline by means of a rope to the end of which the cars are attached. The empty trip is then allowed to run back down the slope drawing the rope after it. The descent of the empty trip is regulated by a brake on the drum.

In endless-rope haulage, there is a single rope, which is led from the drum or sheave of the engine into the mine to a tail sheave at the inby end of the haulage road. Passing over this sheave, the rope is returned through the entries to the engine at the mouth of the mine. In this system, the rope is kept continually running and the cars are attached to it by a special friction clutch or by a form of hook that the weight of the car causes to hold the rope fast.

In main-and-tail-rope haulage, there are two ropes. The main rope passes from the engine into the mine where it is attached to the head end of the loaded trip. The tail rope passes from the engine into the mine and over a return or tail sheave at the inby end of the haulage road, after which it is attached to the rear end of the loaded trip. In this manner, the trip is hauled out of the mine by the main rope, dragging the tail rope after it. The ropes are then changed, the tail rope being attached to the head end of the ingoing empty trip, which is thereby drawn into the mine, pulling the main rope after it. The two ropes are attached to separate drums, which are controlled by brakes.

Gravity-plane haulage is adapted to the lowering of loaded cars from a mine opening to the track below. Electric-motor haulage is adapted to the haulage of coal in mines operated by electricity and in moderately flat seams. Engine-plane haulage is adapted to all cases where loaded cars are to be drawn up an incline and the empties lowered, where the weight of the cars and the inclination of the track render gravity-plane haulage unsafe. Endless-rope haulage is generally adapted to large outputs in moderately flat seams. Main-and-tail-rope haulage is better adapted to undulating haulage roads in otherwise flat seams.

Ques.—If an airway is 2000 ft. long and 6x8 ft. in section, the velocity of the current being 500 ft. per min., what is the power producing the circulation?

Ans.—The rubbing surface in this airway is

$$s = 2\ (6 + 8)\ 2000 = 56{,}000\ sq.ft.$$

The power producing this circulation is then,

$$U = k\ s\ v^3 = 0.00000002 \times 56{,}000 \times 500^3 = 140{,}000\ ft.\text{-}lb.\ per\ min.$$

Ques.—Why are accumulations of coal dust dangerous in bituminous mines of this state (Pennsylvania)? What would be your method of eliminating the danger as nearly as practicable?

Ans.—Bituminous coal is frequently highly inflammable and often gaseous. Much of the coal is reduced to fine dust, in working, and this dust floating in the air increases the explosive condition of the mine. The occurrence of a heavy or blownout shot in the vicinity of any considerable accumulation of dust, either on the floor or timbers of the mine, may raise a sufficient cloud of the fine dust to cause an explosion when ignited by the flame of the shot. As far as practicable, all accumulations of dust should be loaded out of the mine. Where it is impossible to remove the danger in this manner, the roof, floor and ribs of the opening as well as the timbers should be thoroughly sprinkled with water for a distance of 20 yd. back from the face before a shot is fired in the place.

Ques.—In an entry that is wet, there is a small amount of marsh gas generated. Under these conditions, what is the greatest percentage of gas in which you would allow blasting to be done?

Ans.—Before a blast is fired, the place should be examined to see that there is no accumulation of gas at the roof or in any cavity or void place. The percentage of gas in the air current passing through the place should be less than 1 per cent. to insure safety. Every precaution should then be taken to avoid a "tight shot," which might give trouble. The coal should be well mined, and a moderate charge of powder used. All holes should be inspected, charged and fired by competent persons.

Ques.—How would you approach a mine fire to insure safety to the workmen and what methods should be employed to extinguish the fire?

Ans.—All workmen should be withdrawn from the return side of the fire. The work of extinguishing the fire should be performed from the intake side. Competent men should be chosen to do the work and only safety lamps should be employed.

The method to be adopted for the extinction of the fire will depend on its character and the headway the fire has gained. In the early stages of a gob fire, the smoldering material may be loaded out to advantage. Water applied to a gob fire will often render the condition worse, unless it is possible to completely drown out the fire. Where gas feeders have been ignited in the waste, it may be possible and necessary to extinguish these by the explosion of a small amount of dynamite in the vicinity.

Coal and Coke News

Washington, D. C.

Experience during the past week is considered to show that the proposed ship-purchase measure now pending in the Senate will either not be adopted at all or will be passed in such a form as will largely limit its effectiveness as a provider of vessel tonnage. Even strong advocates of the bill hardly claim, now, that the prospective measure will help the shipper of heavy freight.

So far as products like coal are concerned, therefore, it is expected they will continue to suffer from the lack and high cost of shipping in the export trade until relief is had through natural means and that consequently the material improvement of conditions in that trade, as affecting the movement of the goods in large quantities is not to be expected in the near future. Evidence submitted during the struggle thus far, however, shows that it is the shippers of the heavier articles, and of coal in particular, that have suffered most severely until now from the insufficiency of tonnage.

The Personnel of the Trade Commission

It is now generally understood that the President has definitely determined upon nearly all the members of his new Trade Commission and that among the men to be named will be, as already reported, Joseph E. Davies, the present Commissioner of Corporations, George T. Record of New Jersey, E. R. Hurley of Chicago, and one or two others whose names appear less certainly fixed. George Foster Peabody of New York, who no doubt could have been named had he himself been willing, has steadily declined to become an active office-holder.

It is understood that, as soon as the new commission is actually constituted, it will be asked by mining interests to look into conditions in the bituminous industry, with a view to determining what, if anything, can be done to bring about the establishment of a limitation of the over-severe competition in certain of the fields under conditions that will be in harmony with the spirit of the new law and of already-existing industrial legislation in general.

There is no indication thus far of the probable outcome of any such effort. Proposals along this line have been made from time to time to congressional committees during the past few years but thus far have had no success.

Annual Session of the U. S. Chamber of Commerce

The annual session of the U. S. Chamber of Commerce came to a close in this city on Feb. 5, after an unusually large and successful meeting at which special attention was given to the shipping situation, and incidentally general business conditions throughout the mining region were touched upon.

The convention, however, refrained from special or particular action as regards the position of any individual branch of business likely to be directly affected by such action or by legislation, except in so far as the usual resolutions of a broad type might indirectly relate thereto. General business and export trade prospects were discussed at the banquet of the convention by the Secretary of Commerce, while other well-known speakers on trade prospects were heard at the several sessions.

HARRISBURG, PENN.

During the past week a bill was introduced in the House by Mr. Bovee, asking for an appropriation for the improvement of the port of Erie by constructing a modern commercial steamboat landing or wharf upon state lands within the harbor, the primary object of which, it is stated, is better facilities for the shipment of ore and coal over the Great Lakes. The coal to this port is carried by the Bessemer & Lake Erie and the Pennsylvania railroads.

The harbor of Erie is the only port in the state on the Great Lakes. Congress has recognized the importance of the preservation and permanent improvement of the harbor of the port at Erie by appropriating large amounts. It is contended that the port is congested by reason of the inadequate wharves and docking facilities for the handling of coarse freights, such as coal and ore.

The state is the owner of the land lying between the foot of Peach St. and the United States Harbor line, a distance of about 560 ft. upon which land a wharf could be built with the consent of the Commonwealth.

The bill asks for an appropriation of $100,000 or so much thereof as may be necessary for the purpose of constructing and building a modern commercial steamboat landing or wharf upon the state lands, and dredging the approaches on both sides of the wharf.

The Governor is empowered to appoint a commission of five persons to have power and authority vested in them to build the wharf.

After the completion of the dock and until the Legislature shall otherwise provide the mayor and council of the City of Erie shall have power to enact ordinances, etc., regulating the manner in which the dock shall be used.

New Examining Boards Are Appointed

New boards of mine inspectors' examiners and mine foremen's examiners were appointed by the county court for Luzerne and Carbon counties on Feb. 5. An entirely new board of mine inspectors' examiners was named and the old board of mine foremen's examiners were renamed, with the exception of two miners in the 10th sub-district, who were replaced by others because they had been promoted to mine foremanships.

The new board of mine inspectors' examiners include E. R. Pettebone, chief engineer of the Delaware and Hudson Co., A. B. Jessup, general manager of the G. B. Markle Co., mining engineers; Patrick Dougherty of Lansford, John J. Hanlan of Avoca and Daniel P. Bolton of Nanticoke as practical miners.

For several years the work of the Mine Inspectors' Examining Board has been a subject of criticism by mine workers and Union officials, some of whom charged that only sufficient candidates were passed to fill vacancies in the several districts.

Last year the court named Messrs. Gallagher, Miles, McEneany, Evans and Dougherty, who held an examination of five candidates last July and forwarded a report to the Department of Mines. The board never heard from the report and has not been paid, its work having been ignored. It was stated at the time that the Chief of the Department of Mines held that no examination was necessary last year as there were no vacancies to be filled in any of the 8 districts.

It is reported that the miners named on the new board were suggested by officials of the United Mine Workers of America so that further criticism of its work will be eliminated.

PENNSYLVANIA

Anthracite

Summit Hill—The mine fire which has been burning here for the last 62 years and which was believed to have been conquered, has broken out afresh. During the time that this fire has been in progress, coal estimated to be worth millions of dollars has been burned, and great expense has been incurred by the Lehigh Coal and Navigation Co. in fighting this fire. The task of extinguishing it seems hopeless.

Taylor—Several hundred men working in the breaker at the Sloan colliery of the D., L .& W. Coal Co. fortunately escaped injury and possible death on Feb. 6, when two sticks of dynamite, unloaded from a car of coal, passed through the rolls and exploded. The explosion shook the building and put the rolls out of commission. Sixteen hundred hands employed in and about the colliery were sent home for the day.

Kingston—Notice has been served by the Delaware, Lackawanna & Western Coal Co. upon its foremen, driver bosses and others who have charge of employees that hereafter they must not enter saloons. This move on the part of the company is in keeping with the "safety first" movement in the operation of its collieries. The notice to the bosses states that they are expected to set an example for the men, and that any one who violates the company orders and enters a saloon does so at the risk of losing his job.

Plymouth—After lying dormant for several weeks, negotiations for the purchase by the Kingston Coal Co., of the Dodson Colliery, of the Plymouth Coal Co., have been reopened, and prospects of the deal going through are said to be good. Because of litigation over mine caves between Plymouth Borough and the Plymouth Coal Co., the colliery has not been operated for the last 8 months.

Harleigh—Several hundred employees at the No. 7 colliery of the G. B. Markle Coal Co., who have been idle for several weeks following the destruction of the breaker by fire, are now being given employment at night as at that time the coal from another mine will be prepared at the Harleigh breaker.

Bituminous

Pittsburgh—Two steamers of the Monongahela River Consolidated Coal and Coke Co., tne "Sam Clarke" and the "Alice Brown" left Feb. 5 with 490,000 bushels of coal for southern points. Other steamers are expected to leave soon.

Charleroi—January was the best coal month since October, although not an especially good one, in shipments through Lock No. 4. The coal sent down stream during this period amounted to 13,919,000 bushels. Bad weather interfered but slightly with shipments in January, and navigation was only closed for 124 hours during the month.

Connellsville—The H. C. Frick Coke Co. recently lighted 1500 additional coke ovens lying in Fayette and Westmoreland Counties. This order will furnish work for 1500 men, and increase operations of the company from approximately 42 to 60 per cent. A week earlier 1000 ovens were lighted, making 2500 ovens in all.

Windber—The mines of the Berwind White Coal Mining Co. have been working five days a week since the beginning of the year, the longest period they have been continuously operated since the last of July. The company has obviously found a new market for its fuel, or at least a market for the tonnage formerly delivered to the North German Lloyd Steamship Co. before its fleet of vessels was driven from the Atlantic immediately following the outbreak of the war. There is a constantly expanding market for the smokeless coal of this section, due to legal enactment by the more populous centers against smoke producing fuels.

Johnstown—Thomas A. Edison is now constructing a plant in this city costing about $25,000 to $30,000. Mr. Edison and the Cambria Steel Co. have closed a contract whereby Mr. Edison can build his plant on the Cambria Steel property and extract benzol from the coke gas that arises from the nine different batteries of ovens of the company. When completed, it is believed, the byproduct of the Cambria ovens will amount to from 1500 to 1800 gallons a day. It is expected the plant will be ready to start about Mar. 1.

Uniontown—Receivers for the Tower Hill-Connellsville Coke Co. on Feb. 5 filed a petition in court asking permission to insure the fulfilling of a large contract with the Youngstown Sheet & Tube Co. In the petition it is stated that the receivers have entered into a contract to furnish 16,000 tons of coke per month to the Youngstown corporation for one year. The contract price is $1.75 a ton, slightly below the figures quoted in the market, but it is claimed this will permit the operation of the plant at a profit.

WEST VIRGINIA

Grafton—John T. McGraw, of Grafton, is reported to be negotiating with New York interests for the sale of 65,000 acres of valuable coal lands in this section, at a figure running into the millions. The property will be reached by the West Virginia Midland R.R., which is to be standard-gaged, and will be developed at once, if the deal goes through. The B. & O. which is interested in the road, is said to be backing the proposed extension and improvement.

Charleston—Conditions in the coal industry of the New River district has improved much in the last 30 days. January showed a 25 per cent. increase over December, and there has been marked improvement in the coal trade generally since the first of the year.

The judiciary committee of the house of delegates recently met and decided to report unfavorably upon the House Joint Resolution No. 5 pertaining to the classification of property for taxes. This is the measure which contemplated the taxation of coal, oil and gas production which has been causing much comment.

Bluefield—A plan of reorganization of the Big Vein Pocahontas Coal Co. has been prepared by the Committee in charge and a new firm which will succeed the old one and operate the properties involved will be organized. This new company will be incorporated under the laws of West Virginia with an authorized capital stock of $1,800,000, and will also have authority to issue $350,000 of five year, 6 per cent. convertible bonds. The Fidelity Trust Co., of Baltimore will be the trustee for the bonds, which will be dated Jan. 15, 1915.

Boomer—It is reported that the mines in this vicinity will go on full time with full force shortly, as there has been a marked improvement in the work of the mines recently. Considerable coal is now being loaded for Lake trade in anticipation of the opening of navigation.

ALABAMA

Birmingham—Investigation into the probable coal supply along the Warrior River shows approximately 670,000,000 tons of available coal. This investigation was made by W. E. Leake, a well known operator and engineer. The report made by Mr. Leake considers each section of the coal-bearing field along the Warrior River and contigious thereto that is within easy access of the stream. It is figured that this coal can be barged to Mobile for from 30 to 50c. per ton as against the present all-rail rate of $1.10, and as the quality of the coal in the Warrior River district is of the best, the tonnage moved should be large.

The semiannual examinations for first- and second-class mine foremen's and for fireboss' certificates was recently held by C. H. Nesbitt, chief mine inspector, and his board of examiners. Twenty-nine applicants presented themselves for examination.

KENTUCKY

Whitesburg—Representatives of the big coal companies in Letcher County have gone before the Board of Tax Supervisors to protest against increases in assessments of their properties, which have run in the aggregate to $1,000,000. These increases include the following: Consolidation Coal Co., $124,000; Mineral Fuel Co., $100,000; Swift Coal & Timber Co., $100,000; Mineral Development Co., $60,000.

Jackson—The Davis Coal Co.'s mines near here, after a month's shutdown, have been reopened and full time operations will soon be in order.

St. Charles—It is understood that the Carbondale mine near here, which has been shut down for several months, will resume soon. It gives employment to 150 men, most of whom have been idle during the term of suspension.

Richmond—The property of the Big Hill Coal Co., in Bell County, was sold by John C. Chenault, receiver, to H. B. Hanger, of Richmond, who in turn sold the property to the Caney Creek Coal Co., of Chattanooga, Tenn. S. F. Rock, who was superintendent of the mines, has resigned and returned to his home here.

Frankfort—Bell County has been selected by the State Board of Health and the Rockefeller Foundation for an experiment in intensive community work and a mining camp near Middlesboro, yet to be selected, it is understood, will be developed into conditions approximately ideal from a sanitary and hygienic standpoint. A sanitary engineer and two nurses will be paid by the Foundation during the experiment and the nurses will be chosen by the Kentucky Tuberculosis Commission. The mine owners and operators of the state are taking much interest in the experiment.

OHIO

Columbus—The chances for the establishment of standard preparations of bituminous coal in the states of Ohio, Pennsylvania, West Virginia, Indiana, Illinois and Kentucky are not as bright as formerly, according to the statement of those interested in the movement. Considerable opposition to the plan of making 1¼-in. lump only has arisen and the doubt arises if such a rule can be enforced in case it is adopted. But the plans for holding a general conference of committees representing the above mentioned states has not been abandoned and every effort will be made to bring about standardization of sizes.

Prominent coal men in Ohio are making an effort to have one of the experimental stations on mining, authorized by congress, located in Columbus.

Senator Gallagher recently announced that he would offer a bill to amend the Green run-of-mine law by which amendment operators and miners would be permitted to enter into contract for mining coal in any manner and at any price. If they are unable to reach an agreement, however, the run of mine plan must prevail.

INDIANA

Indianapolis—Among the bills introduced in the Indiana Legislature now in session is one providing that the operators shall pay for shot-firing; another aims to prohibit strip-mining and a third provides for the codification of the mining laws of the state.

ILLINOIS

Murphyboro—Several days of heavy rain fall and back water from the Big Muddy River recently caused a suspension at the large No. 9 mine of the Big Muddy Coal & Iron Co., on account of several dangerous cave-ins.

Tilden—The Crystal mine has suspended operations here on account of a disastrous cave-in in the air shaft. Fortunately, no one was injured at the time, and if rainy weather ceases, the plant will be in shape to operate again in a short time.

The mine of the Bessemer Coal & Mining Co. here has suspended operations indefinitely. The cause given is lack of business at a profitable figure.

Cambria—The Carterville & Big Muddy mine has been taken over by a company of men headed by Rudolph Specker, a brewer of Murphysboro, who are bondholders to the extent of about $30,000. The mine has been shut down indefinitely.

East St. Louis—Although freight rates have gone up, effective Feb. 1, on coal from the southern Illinois fields to St. Louis, Mo., the rates from the same fields to East St. Louis will not go into effect until the Illinois State Utilities Commission has made an investigation. The hearing has been set in Springfield, Illinois, for Feb. 16. The rate which was to go into effect on the first was an advance of 5½c. a ton. This would make the East St. Louis local rate 37½c. a ton. It is likely that the rate will remain 32c., however, inasmuch as the manufacturing industries in East St. Louis and adjoining cities have been built up with the express understanding that their coal supply was to come in on the low rate.

Springfield—Judge Creighton, in the Sangamon County Circuit Court, on Feb. 4 refused to grant a temporary writ of injunction brought by Samuel H. Putnam, of Chicago, a bondholder of the defunct Illinois Collieries Co. to restrain the Pittsburgh Coal Co. from selling the property of the Collieries company.

IOWA

Des Moines—Coal operators of the state have decided to take no action on the Clarkson State Insurance Bill as the opinion of 50 operators present at a meeting of the Iowa Coal Operators Association was divided regarding the merits of the measure which provides for a State Insurance Fund. No stand was therefore taken, and no resolution passed regarding the proposed measure. This will be left to members of the executive committee.

FOREIGN NEWS

Paris, France—With winter weather of unusual severity prevailing, France faces a coal famine because the Germans hold the territory from which most of the fuel is obtained in normal times. It is estimated that the present monthly demand is 4,000,000 tons more than is produced, which makes it necessary to draw upon reserve supplies, and to use wood for fuel.

PERSONALS

Stephen B. Sexton, president of the East St. Louis Real Estate Exchange, and head of the firm of Sexton & Son, has been elected a member of the Board of Directors of the Southern Coal & Mining Co.

Osborne Mitchell has been appointed general counsel for the Petroleum Iron Works, Pennsylvania Tank Car Co., The Pennsylvania Tank Line, and the Pressed Steel Products Co. His office will be in the Wick Building, Columbus, Ohio, after Feb. 15. The corporations above named are strongly interested in safety and welfare work, and Mr. Mitchell's duties will entail extensive investigations in this field.

OBITUARY

Henry Harrison Harvey, pioneer coal operator, and prominent in industrial circles throughout the Wyoming Valley, died at Wilkes-Barre, Penn., Feb. 4, from heart trouble. For years he was superintendent of the Harvey Mines at West Nanticoke. Since his retirement as a coal operator he has been identified with many movements of enterprise, and has sought to develop the community.

Charles P. McCafferty, owner and manager of the Monarch mine at East Brady, Penn., in the Allegheny Valley, died at his home on Feb. 2, of apoplexy, leaving a wife and two daughters. He had been the president of the Allegheny Valley Operators' Association since it was organized several years ago and was highly esteemed on account of his excellent character and his charitable disposition. He was born in Fairview, Butler County, Penn., in 1848.

F. M. Lechner, aged 78, a well known inventor of Columbus and the originator of the first successful mining machine, died suddenly last week of apoplexy. His first patent on mining machinery was granted in 1877. He later organized and became president of the Lechner Mining Machine & Manufacturing Co. J. A. Jeffrey soon afterwards purchased the business and patents and then organized the Jeffrey Mfg. Co. Mr. Lechner retained stock in the new company and represented it in Europe for about 10 years. He leaves two sons.

CONSTRUCTION NEWS

Hazleton, Penn.—Plans are being prepared by the G. B. Markle Co. for the rebuilding of the Highland Breaker at a cost of approximately $200,000.

Youngstown, Ohio—The erection of a battery of coke ovens capable of producing 50,000 tons monthly and of a finishing mill with a capacity of 25,000 tons per month, is planned by the Youngstown Sheet and Tube Co. The construction of the coke ovens has been positively decided upon, while the exact nature of the finishing mill remains yet to be determined. An outlay of more than $6,000,000 will be required to carry the plan through.

Great Falls, Mont.—The Roberts & Schaffer Co., of Chicago, has been awarded the contract by the Cottonwood Coal Co., for a complete fireproof coal tipple and washing plant to be erected at the mine at Lehigh, Mont. The tipple will have a capacity of 3500 tons per day and will be built to accommodate self dumping cages and mine skips. It is to be equipped with modern coal screening and picking facilities, driven by electric motors throughout. The washery will have a capacity of 2000 tons daily. It will be built of reinforced concrete and steel, and will be equipped with facilities for coal drying. It also will be electrically operated.

Wendell, W. Va.—The Maryland Coal Co., with headquarters at No. 1 Broadway, N. Y. City, is remodelling its tipple located at the mine at Wendell, W. Va., to a considerable extent in order to double the capacity. The latest machinery, dumps, chain hauls, etc. ,will be installed. The general contract has been let to Arthur S. West, 15 East Fayette St., Baltimore, Md. He in turn has let a contract to the Canton Lumber Co. of Baltimore for the supply of lumber, to the Eastern Railway Supply Co. American Bldg., Baltimore, for hardware, nails, etc., and to the Stockdale Machine & Foundry Co., for the equipment. The total expenditure will be $40,000.

Pittsburgh, Penn.—As the House of Representatives has reported favorably the sum of $300,000 for the Bureau of Mines, it is expected that the preliminary work on the new buildings to be erected on the Magee site adjoining Schenley Park and the Carnegie Institute of Technology, will be begun about Mar. 15. There is available $150,000 for the preparation of the foundations and other work. The structure complete, including necessary apparatus, will cost $500,000. A second appropriation authorizes the creation of 10 new substations of the Bureau which will be situated at various convenient points throughout the country with one in Alaska. There are now six sub-stations and eight mine rescue cars. The number of cars is to be increased to 23. The administration of these sub-stations and the mine rescue cars will be from the headquarters of the Bureau of Mines in Pittsburgh as at present.

NEW INCORPORATIONS

Hopkinsville, Ky.—The Southern Coal Co. has filed articles of incorporation, with a capital of $50,000. Thomas P. Cook, O. F. Tutt and T. L. Evans are the incorporators.

Middlesboro, Ky.—The Wasioto & Black Mountain R.R. Co. has filed an amendment to its articles of incorporation, increasing the limit of its indebtedness to $10,000,000.

Newport, Ky.—The Logan & Kanawha Coal Co., with $25,000 capital, has been incorporated here, having been organized by Fred Legg, F. A. Walker, Howard Benton and others.

New Waterford, Ohio—The New Waterford Mining Co. has been incorporated with a capital of $50,000 to mine and sell coal by F. F. Leuk, A. P. Mullins, J. E. Morgret, R. D. Anderson and D. A. Warner.

Chattanooga, Tenn.—The Old Virginia Coal Co. has filed applications for a charter, listing its capital at $50,000. The incorporators are J. R. Barnes, W. L. Lawton, H. B. Bonney, C. W. Lusk and W. B. Miller.

INDUSTRIAL NEWS

Whitesburg, Ky.—It is alleged that the Roberta Coal Co. will build a mining plant near here.

Columbus, Ohio—The announcement is made by the executive committee of the Michigan-Ohio-Indiana Coal Association that the annual meeting will be held at Cedar Point during the week of June 20, possibly the 22, 23 and 24.

Hinton, W. Va.—Shipments of coke over the Chesapeake & Ohio for the last two years show a decreased tonnage for 1914 of 65,577 tons, or over 18 per cent. During 1913, 361,535 tons were shipped, while in 1914, 294,598 tons were moved.

Columbus, Ohio—At the instance of Mayor Karb of Columbus a committee has been appointed to receive donations of food and clothing to be shipped to miners and their families at Rendville, Perry County, where suffering has been acute.

Wellsville, N. Y.—The Kerr Turbine Co. has appointed W. E. Storey as its Toronto, Can. representative, with offices in the Kent Building. Mr. Storey was formerly identified with the Under-Feed Stoker Co., and more recently with the Goulds Mfg. Co.

Duluth, Minn.—During the year 1914 almost a quarter of a million cars of coal and coke were shipped from the docks on the St. Louis Bay water front. During the year 248,845 cars were shipped. This compares with 257,283 cars in 1913, and 276,384 cars in 1912.

Buffalo, N. Y.—There is prospect of a duty on anthracite coal and coke imported into Canada, as the country needs more revenue to meet war expenses. About 20c. a ton is proposed. The present duty on bituminous sizes is 53c. a ton and on slack, 13 cents.

Huntington, W. Va.—Another of the large coal interests of the New River field is preparing to open offices in Huntington. W. H. Deegans, who controls eight companies and as many operations in Fayette County, has leased quarters in the First National Bank Building. From these offices will be conducted the sales department of the business.

Birmingham, Ala.—The Pratt Consolidated Coal Co. is constructing an electric tram line from its Maxine Mine to a point on the Warrior River, where the back water from Lock 17 will touch. This is being done to facilitate the movement of the coal down the Warrior when Lock 17 will have been completed, which is now a matter of only a short time.

Bluefield, W. Va.—S. H. Meem and R. S. Haskins, of Bluefield, who lately leased coal land in the Perry County field near Hazard, Ky., will soon start development work. The property lies on the Lexington & Eastern branch of the Louisville & Nashville Ry., and in a section being rapidly developed. A dozen or more coal-mining plants are in close proximity.

Birmingham, Ala.—Inquiries are coming to the coal operators here from Greece and other foreign countries for coal, Greece being willing to take 50,000 tons if it could be delivered in reasonable time. The lack of bottoms will be a great hinderance. Italy's and Sweden's former source of supply has been cut off and these countries are anxious to get Alabama fuel.

Fayetteville, W. Va.—An embargo was recently placed on eastern shipments from the New River region, resulting in a stagnation of coal movement. This measure was adopted on account of the congestion of the coal traffic at tidewater. Several thousand cars are now awaiting movement. It is expected that the embargo will be raised in a short time and shipments resumed.

Columbus, Ohio—According to the financial statement of the Hocking Valley Ry. Co. for the month of December, there is a heavy falling off in operating earnings compared with the corresponding month in 1913. The revenues during December, 1914 were $414,791 a decrease of 28 per cent. from December, 1913 when they were $574,411. The heaviest decline was in freight revenues.

Bristol, Tenn.-Va.—An appreciably increased coal tonnage is moving South from this section and has been since the first of the year, an indication that Southern industrial conditions have been much improved. The Virginia fields have suffered sharply on account of the stagnation of the cotton market but the coal operators believe the worst is now over and that business will rapidly improve.

Washington, D. C.—The Interstate Commerce Commission on Feb. 5 denied the petition of the Illinois coal operators who sought to bring about a regrouping of mines in the state for rate-making purposes. The operators particularly sought to decrease the so called Springfield group, and alleged that application of the same rates to northwestern points of shipment from all mines in that group was unjust.

Cincinnati, Ohio—High water on the Ohio River, which brought down quantities of driftwood, nearly caused the loss of several coal barges of the Marmet Coal Co. recently. Eight loaded and six empty barges broke away when struck by a large amount of driftwood, and floated some distance down the river, but were all caught by pursuing steamers and tugs. Several men narrowly escaped drowning in the mixup.

Pittsburgh, Penn.—Extensive coal land purchases in Washington County are being hinted at by Pittsburgh brokers, specializing in this class of property. Offers to buy tracts of coal have been given brokers, and they report having spent much time with owners of such land. The volume of inquiries is large, and the prices offered are said to be fair, and it would not be surprising to see considerable land change hands.

Philadelphia, Penn.—The suit in the United States Circuit Court of Appeals of the Pittsburgh-Buffalo Co. against the American Fidelity Co., a surety corporation, ended Feb. 4 with an opinion by Judge Victor B. Woolley, reversing the Western District Court and ordering a new trial. The case involves a claim of about $12,000. The claim was for alleged breach of contract on the part of J. J. Dimmick & Co. on refusing to take further orders of coal.

Columbus, Ohio—Charles H. Boardman, president of the Murray City Coal Co. and treasurer of the Tidewater Coal & Coke Co., with offices in the Wheeler Bldg., Columbus, has filed a petition in bankruptcy in the United States Court with liabilities of $357,101.39 and assets of $3138. Included in the liabilities are notes and accounts due to the Union National Bank, which has been liquidated amounting to $122,000. Of his liabilities, $259,850 are secured.

Des Moines, Ia.—The sale of Indiana coal to tile plants in Iowa, which has been of considerable magnitude in past years, is lessening because of the inroads of southern Illinois coals. The selling of Iowa domestic coal at home is also decreasing because of the competition of Franklin County fuel and Eastern splints. The production of Iowa coal is gradually becoming less, and authorities estimate that 25 years will see the exhaustion of the present known Iowa coal fields.

Knoxville, Tenn.—More than 100 coal operators and representatives of mining interests in east Tennessee and southeastern Kentucky were present at the recent session of the Southern Appalachian Coal Operators' Association's convention. Col. James R. Wooldridge, of Wooldridge, Tenn., was elected president, succeeding E. C. Mahan, and James E. McCoy was reëlected secretary. Mr. Mahan served for two terms and declined a third. The Commercial Club was host to the visitors at a luncheon and the annual banquet was held in the evening, with President-elect Wooldridge as toastmaster.

Birmingham, Ala.—The Alabama operators, through the Alabama Coal Operators' Association, has petitioned the Interstate Commerce Commission to have the rates on coal to various Mississippi Valley points reduced. They claim that although the haul from the Illinois and Kentucky field is practically twice as long as from Alabama, that these districts have a freight rate to the common points of only about 15 to 20c. per ton higher than from the Alabama fields, and to practically all of the smaller points the same rate as Alabama. They claim that this is discrimination and that the rates should be adjusted.

Chicago, Ill.—It is apparent that the stealing of coal during the winter months in the Middle Western States, which has been a considerable problem to the carriers and retail dealers in past years, has decreased greatly thus far this season. The railroads are policing shipments while in transit much more rigorously than before; and appear to surround shipments of coal with better protection, and show a disposition to coöperate more with the retailers to prevent losses from this source. It is also noticeable that the carriers show greater willingness to pay claims for loss and damage to coal while in transit than in the past.

Coal Trade Reviews

General Review

January anthracite shipments the lowest in years and prices becoming heavy. Ocean freights the ruling factor in off-shore bituminous. No definite indications of any improvement. Middle Western markets demoralized.

The extremely flat conditions in the anthracite trade are reflected in the official statement of January shipments, which show the smallest movement for that month in years. In spite of the constantly recurring cold snaps, buying is not stimultaed, and the outlook for the current month is even more discouraging. With the exception of a fairly persistent call for some of the smaller steam sizes, there is practically no demand in any direction. Prices are naturally under a heavy pressure, and the April circular is being quoted on the domestic grades.

The chaotic situation in ocean freights continues to be the predominating feature on the Atlantic Seaboard. However, it is clear that some of the larger interests believe they have the freights well in hand as is evidenced by the closing of a number of contracts at a very slight advance over last year's figures. As a result of the steady increase in export freights on other commodities, no coal charters are reported, and the acuteness of the situation is shown by the purchase of two large Lake carriers for use in the Coastwise trade.

Spot prices on the West Virginia grades have hardened up slightly at Down East points, and it is generally agreed that the high-grade Pennsylvania coals will very probably make large inroads on the Hampton Roads grades in those markets. In the other Eastern sections there seems to be a disposition among buyers to increase their purchases very slightly, and there are indefinite indications of an improved undercurrent, but the situation in the main shows little of a real encouraging nature.

A very modest increase in the manufacturing demand in the Pittsburgh district, supplemented by a broader domestic demand, as a result of the colder weather, has created a more hopeful spirit, but on the other hand buyers are confident that they will be able to negotiate new contracts at a reduction over last year's figures. But it is clear that the recent effort to stimulate an artificial activity with sanguine reports of different kinds, has collapsed. There has been a reaction in the Ohio trade as a result of the mild weather and continued industrial depression, and the market has been forced down to new low levels. Stocks in the hands of the retailers appear larger, though the floods are interrupting shipments to some extent.

The demand has practically ceased entirely in the Middle Western market, prices have softened, some demurrage coal is already noted at the principal distributing centers, and reports indicate that there is a large tonnage of consignment coal en route in all directions. The trade is clearly distressed to absorb the large surpluses accumulating, and shippers on the open market are having an extremely hard time with nothing encouraging in sight unless it be a continued spell of exceediglny low temperatures.

ATLANTIC SEABOARD

BOSTON

Hampton Roads coals unchanged as to price f.o.b. but situation begins to clear up. Georges Creek and the Pennsylvania grades await developments. Water freights are easy at the advanced rate. Anthracite has again relapsed into dullness.

Bituminous—The situation on Pocahontas and New River shows signs of settling down. The high water freights have caused some apprehension, especially to consumers directly on Tidewater but now it appears that interests that control their own transportation have made a smaller advance over last year's prices than was looked for. In some cases yearly contracts have been closed at only 7c. up from last year's opening on cars at Providence, Boston, and similar points. A quiet canvass continues on the part of such shippers and a fair amount of business is being entered up.

There is no change in prices fo..b. Hampton Roads. The demand is only scattering and there is still plenty of coal standing at all the piers. The spot market at Boston and Providence for distribution inland is slightly improved. Prices have hardened a little, showing the influence of higher water freights.

The on-car basis for season contracts at Boston points seems to be \$3.85@3.90, the former being the price to the closer buyers; \$3.85 analyzes into \$2.85 f.o.b., at 77c. water freights, and 23c. for discharging, weighing, and insurance. This shows how willing some shippers are to discount the freight market.

The Georges Creek shippers are confining themselves to filling expiring contracts. There is little heard from them with regard to season prices alongside and it is assumed they are waiting until their Southern competitors have settled down into some consistent policy. All-rail and f.o.b. they are following the lines of 1914.

Shippers of the Pennsylvania grades are showing an active interest in the market at Tidewater as well as all-rail. The difference in rates between anthracite transportation and bottoms on the open market makes the New England trade look attractive and it is probable that receipts this year from Philadelphia will be materially increased. There is nothing definite as yet to be reported but it is likely that some of the high grade Cambrias and Somersets will make inroads on West Virginia's usual tonnage in this market. There is no spot market worth mention but there is quite a little inquiry for contract.

Water Freights are easy at \$1, Hampton Roads to Boston, all kinds of transportation, the demand being extremely quiet. By some this rate is regarded as artificial, there is so much tonnage offering, but so far that basis is being firmly maintained. Two steamers have lately been bought to come from off the Lakes and this will help out the supply of bottoms along the coast.

Anthracite showed a mild spurt for a few days. The low temperatures were not sustained, however, and inquiry has again fallen off.

Prices on bituminous are quoted about as follows:

	Clearfields	Cambrias Somersets	Georges Creek	Pocahontas New River
Mines*	\$0.90@1.50	\$1.15@1.65	\$1.67@1.77	
Philadelphia*	2.15@2.75	2.40@2.90	2.92@3.02	
New York*	2.45@3.05	2.70@3.20	3.22@3.32	
Baltimore*	....	....	2.85@2.95	
Hampton Roads*	....	....	....	\$2.70@2.75
Boston†	....	....	....	3.85@3.95
Providence†	....	....	....	3.80@3.90

* F.o.b. †On cars.

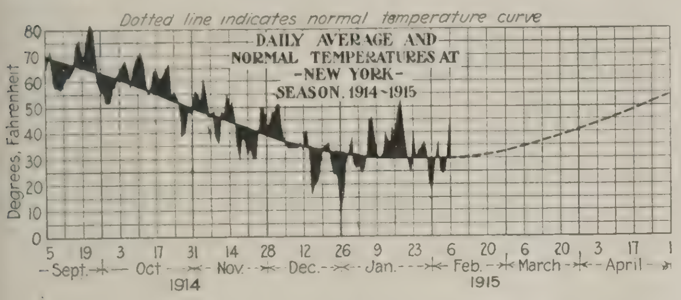
NEW YORK

More bituminous on consignment and numerous embargoes in effect. Heavy restriction in the anthracite regions and market in the worst condition for a long time. Fair demand for steam grades.

Bituminous—The soft coal situation has shown no material change during the past week. There is possibly more free coal at the piers, but so far this has had no material effect upon prices. Numerous embargoes are in effect to South Amboy and open-market sales are much limited. Contract requirements are about the same as they have been for some time past. Mines producing the best grades are working 80 to 100%, while those mining the poorer qualities are working anywhere from one to four days weekly.

There is considerable interest being taken on the part of the New England middle houses over the Coastwise vessel situation. There has been no change in vessel rates but shipments for Hampton Roads to Boston and other New England ports are being restricted by reason of the shortage in transportation; \$1 has been paid in numerous cases. Brokers are asking \$1.10, but we have not heard as yet of any case where this has been paid. The middle houses in New England are showing an inclination to keep in close touch with Pennsylvania shippers and a few sales of Pennsylvania coals have been made to take the place of Southern coals. This has not as yet affected the market but there is still hope on the part of many, and an expectation on the part of most, that further business will develop within the near future, increasing the demand for the Pennsylvania product. The market is quotable as follows: West Virginia steam, $2.35@2.55; fair grades, Pennsylvania, $2.55@2.65; good grades of Pennsylvania, $2.70@2.80; best Miller Pennsylvania, $3.10@3.15; Georges Creek, $3.15@3.25.

Anthracite—The hard-coal trade is in worse condition for this period of the year than it has been for a long time. The whole anthracite region is restricting to from two to three days per week, the retail demand is extremely light and dealers have most of their equipment tied up for lack of business.



Broken coal, in the harder grades particularly, is short in supply and active in demand, due principally to the restriction. Egg coal, both hard and free burning, is the best size according to demand. Stove and chestnut sizes, in both hard and free burning grades, are a great drug. Prices on all of the prepared sizes vary all the way from the April to the winter circular. Individual coals in odd lots are to be had at material concessions. Company coals are held firm at the prevailing circular.

The steam sizes are in better condition, so far as prices are concerned, due to the restriction. Pea coal is steady at the circular and easy as to supply and demand. Buckwheat, rice and barley, particularly in the better grades, are short and are held firm. The poorer grades are sold at some concession but prices are much better than usual during periods of full-time work at the mines. The steam size situation is generally satisfactory.

The market is quotable as follows:

	Upper Ports		Lower Ports	
	Circular	Individual	Circular	Individual
Broken	$5.10	$4.60@5.10	$5.05	$4.55@5.05
Egg	5.35	4.85@5.35	5.30	4.80@5.30
Stove	5.35	5.10@5.35	5.30	5.00@5.30
Chestnut	5.60	5.30@5.60	5.55	5.25@5.55
Pea	3.55	3.45@3.55	3.50	3.35@3.50
Buckwheat	2.80	2.60@2.80	2.50@2.75	2.35@2.75
Rice	2.30	2.20@2.30	2.00@2.25	1.75@2.25
Barley	1.80	1.70@1.80	1.75	1.47@1.55

BUFFALO

Consumers apparently have all the coal they need and excess stocks are becoming apparent. Loading into Lake vessels and curtailing of mine operations. Slack generally scarce.

Bituminous—Many of the trade no longer report any new leads, while consumers have large stocks and are not using their coal rapidly. On the other hand there are some who now look for a genuine stir before long. There has been much effort to create an artificial activity by sanguine predictions but that plan has failed. There is a scarcity of slack at the moment, due to the slow sale of three-quarter but the price has not improved and is not expected to right away. The demand for sizes has not changed much, except that mine-run has profited some on account of the light supply of slack. Certain shippers report renewals of contracts at old figures though they are careful not to say what these figures are.

There is no change in the prices of bituminous, all quotations being on the basis of $2.80 for best Pittsburgh lump, $2.70 for three-quarter, $2.55 for mine-run and $2.15 for slack, with Allegheny Valley sizes 25c. lower than Pittsburgh.

Anthracite—Retailers appear to be satisfied with their sales, and they look for a further increase before the turn of winter. But the shippers are not so well satisfied; some of the leading mines have been shut down two or three days a week and others are piling up surpluses, either in Lake vessels here or in storage depots. The line business is quiet and promises to remain so. The heavy storm of last week tied up deliveries four or five days, but the consumer was not disturbed.

The Lake cargoes held here now embrace more than 150,000 tons and more than one company has taken tonnage for early loading. Reports from the Northwestern trade agree that there is a good tonnage moving, but that there will be a good surplus left over when spring opens.

PHILADELPHIA

Anthracite gives no indication of improvement. Rigid curtailment still in effect. Bituminous continues sluggish, with demand and prices at low ebb.

Anthracite—The past month has been the poorest experienced in this vicinity for the last fifteen or twenty years. The open weather, combined with certain economic conditions, reduced the demand to practically nothing, and the prospects for the current month are equally unfavorable. Outside of a call for buckwheat and rice, for which the demand is in excess of the production during a curtailment, the market is inert. Dealers appear to have sufficient stocks to carry them over until the opening prices on the first of April; that is, providing no unusual weather conditions prevail. There is no difficulty at the present time in securing almost any domestic size at, or near, the April circular. Egg seems to be in better call than either stove or nut, reflecting a condition which usually prevails at this season.

There is a general feeling in the trade that there is not likely to be much if any change in current conditions. Dealers are buying only where necessary to fill gaps in their stocks, and jockeying their supplies so as to carry over as small a tonnage as possible into April.

Prices at Tidewater rule about as follows:

	Circular	Individuals
Broken	$4.75	$4.50
Egg	5.00	5.00
Stove	5.00	5.00
Chestnut	5.25	4.80@4.90

Bituminous—There seems to be little or no indication of improvement in the bituminous situation. Outside of a slightly increased activity at Tidewater, the market continues lifeless and without feature. Considerable coal is moving from Tidewater, mostly Georges Creek, but the line trade is almost at a standstill insofar as new business is concerned. Continuous soliciting nets poor results, and the future hold out little hopes for an improvement either in demand or prices. Prices are on about a parity with the previous week, ranging from 90c. to $1 for medium grades, and 25 to 30c. higher for the better qualities.

BALTIMORE

Inquiries are more numerous, though for small lots. Export business picking up again. Colder weather aids the hard-coal business.

A number of small inquiries have appeared in the local market, and while the tendency to buy in small lots has not been generally overcome there is more of a disposition to close for larger tonnages than has been evident for some weeks past.

Colder weather is helping the anthracite business and small-order trade is especially active. Deliveries from mines to terminals have been comparatively easy, although much of the coal has arrived here in a badly frozen condition.

The foreign business is again showing evidence of a revival. Charters announced here the past week included the following: Steamer "Gothard," to Italy; schooner "D. H. Rivers," to San Juan; steamer "Rio Parahy," to Genoa; steamer "Hova," to Savona; steamer "Signe," to Havana; and steamer "Hopemoor," to Alexandria.

An interesting announcement was made to the trade in a new interstate commerce schedule which places an additional tax of $2 for every car reconsigned while en route on the railroads centering here. Heretofore this has always been done by the roads free of cost.

HAMPTON ROADS

Movement over the piers light. January tonnage larger than December but somewhat smaller than expected.

Dumpings over the piers at Hampton Roads have not shown up well. The Coastwise movement has only been about fair while export cargoes have been few and small. With the exception of two cargoes the entire export movement went forward in schooners.

During the month of January there was shipped from Hampton Roads 886,535 tons of which the Norfolk & Western dumped 401,427 tons, the Virginian Ry. 247,433 tons and the Chesapeake & Ohio 237,675 tons. These figures show an improvement over the December dumpings by over 50,000 tons but it was expected the January tonnage would show up much heavier.

Recent clearances have been noted as follows:

Vessel	Destination	Vessel	Destination
Eagle Wing	St. George	Calumet	Para
Elizabeth Gilbert	Puerto Cabello	**Merity**	Rio de Janeiro,
Eleanor F. Bartrim	Rio de Janeiro,	**Sif**	Unknown
Frances M.	Rio de Janeiro		

Note:—Schooners are noted in **bold face** type.

OCEAN FREIGHTS

Freights still advancing. Very few export charters.

Since our last report the market has again advanced to new high levels, owing to the increased demand for steamers for grain, cotton, etc. Very few charters have been completed for export coal and none of these reported.

The market is still hardly quotable, but approximate steamer prices on coal may be take nas follows:

To	Rate	To	Rate
Havana	**$2.75**	Guantanamo	**$3.25**
Cardenas or Sagua	3.25@3.50	Demerara	**5.50**
Cienfuegos	**3.25**	Bermuda	3.75@4.25
Port of Spain, Trinidad	3.00@3.50	Vera Cruz	3.25@3.50
St. Lucia	3.00@3.50	Tampico	3.25@3.50
St. Thomas	3.00@3.25	Rio	**9.60**
Barbados	3.00@3.50	Montevideo, Buenos Aires or La Plata	**8.88**
Kingston	**3.25**	Mediterranean	9.60@10.80
Curacao	**3.00**	Valparaiso	**7.20**
Santiago	**3.25**		

Note—Rates noted in **bold face** type are only approximate.
W. W. Battie & Co.'s Coal Trade Freight Report.

OCEAN CHARTERS

Coal charters have been reported by the "Journal of Commerce" as follows:

Vessel	Nationality	From	To	Tons	Rate
Rio Pirahy	British	Baltimore	Genoa	2297	
Signe	Norwegian	Baltimore	Havana	1302	
Alice May Davenport		Norfolk	Para	952	$4.50
Edith H. Symington		Norfolk	Charleston	881	0.95
Fannie Palmer		Norfolk	Rio Janeiro	1726	5.60
